The United States has undertaken a comprehensive research program for the conversion of saline water and has expended over $10,000,000 since the program was started in 1953.[25] It has entered into cooperative agreements with both the States of Arizona and California for mutual assistance and exchange of information.[26]

---

[25]Congress, to meet the urgent need for further research and development to bring the cost of de-salting within economic range, enacted the Saline Water Act of July 3, 1952 (66 Stat. 328, 42 U.S.C. Secs. 1951 et seq.) which directed the Secretary of the Interior to engage in a 5-year program of research and development for low cost conversion of saline water. To carry out this program the Office of Saline Water was established in the Department of the Interior. Three years later, by the amendatory act of June 29, 1955 (69 Stat. 198), Congress broadened the 1952 legislation to a 14-year program. The amendatory act also increased the total authorization from $2,000,000 to $10,000,000. On September 2, 1958, Congress enacted Public Law 85–883 (72 Stat. 1706) providing for the construction of five demonstration plants to be test operated in a 7-year period, and an additional ten million dollars was authorized to be appropriated for this purpose. One demonstration plant to convert sea water was to be located on the West Coast, and one to treat brackish water was to be located in the arid Southwest. The demonstration plant sites selected in the West are at San Diego, California and Roswell, New Mexico. House Report No. 71, *supra*, pp. 57–107, Thirty-first Report by Committee on Government Operations—Saline Water Program, House Report No. 2551, 85th Cong. 2d. Sess., pp. 3–4. During the short span of 8 years the Office of Saline Control has been in existence, the curve of comparative costs has gone down further and faster than in all previous history. Report of Secretary of the Interior to the President on Saline Water Conversion—1959—p. 3.

III.

THE SPECIAL MASTER'S RECOMMENDED ALLOCATION OF MAINSTREAM WATER AMONG CALIFORNIA, ARIZONA AND NEVADA SHOULD BE SUSTAINED

It has been the position of the State of Nevada throughout this entire proceedings, and it is her position now, that, as a sovereign State, she is entitled to be protected in her right to the use of waters of the main Colorado River for the sustenance and development of Southern Nevada. While the amount suggested to be decreed by the Report of the Special Master is less than that requested by Nevada as has heretofore been pointed out, it is an amount which will permit continued substantial development of this area. But it is close to the absolute minimum that could have practical value to that section of the State.

The one basic issue now is: Should the division of mainstream water among the three Lower Basin States delineated in the recommended decree be adopted, upon any or all applicable theories of law?

Much argument has been advanced during the hearing and in subsequent briefs and exceptions as to whether the Compact or the Project Act or the Limitation Act is controlling, one against the other, or whether they, or any combination of them, are mutually exclusive in providing the rules for the decision of this case. Even the Special Master's Report follows this general pattern in ruling out some of these pertinent statutes in favor of others.

While Nevada accepts the Special Master's recommendation and agrees with its basic logic and conclusion, it does not appear to her that all of the specific steps in his reasoning are necessary.

In Nevada's opinion, immediately upon, and forever after the time that President Hoover proclaimed that the Project Act was in effect, everyone connected with the administration of the Colorado River has been presented by an intermingled, interrelated

and correlated body of statutory law. Since the Compact was ratified, not in a separate Congressional Act but as an integral part of the Project Act, it seems implicit that the two must always be construed together and are, in effect, one over-all statutory enactment.

Not only are they both so included, but so also is the Limitation Act, the passage of which was by the Congress, made a condition precedent to the effectiveness of the Act ratifying the Compact and authorizing the construction of Hoover Dam and related works. In addition, the general Reclamation Law was incorporated in the enactment to the extent that it was not inconsistent. So there resulted a single "bundle" or "package" of regulatory provisions. We mention this because we think it leads to confusion to say that any one part of this "package" shall control to the exclusion of the others; or, to say that any of the integral parts are irrelevant. For it is necessary to look to and give effect to the provisions of all of them in arriving at a final, logical answer.

A. The Colorado River Compact.

So far as the Compact itself is concerned, it is noteworthy as much for what it did not prescribe as for that which it did prescribe.

It is crystal clear, and now conceded by all the parties to this action, that the Compact did make an apportionment of the amount of water that could be applied to beneficial consumptive use in each the Upper and Lower Basins by the provisions of its Articles III(a) and III(b). By these provisions, the Lower Basin is given the right to consumptively use, out of the entire Colorado River System 8,500,000 acre feet of water, and the Upper Basin the right to use 7,500,000 acre feet of water. This latter being subject, of course, to the possible exception that by Article III(d) in the Compact, the Lower Basin must, in every 10-year period

permit 75 million acre feet of water to pass Lee Ferry for use in the Lower Basin, if that amount is required to permit the Lower Basin users to exercise the full rights granted by the Compact. And also that the Compact provides the method of supplying the amount of water required by the Mexican Treaty to be delivered to Mexico from both portions of the Basin.

The foregoing are self-evident and no one considering the problems of the river can either close his eyes to their meaning and implication or ignore their effect.

There are other things that the Compact does not do. One of the most self-evident of these is that it did not allot water to specific States, in either the Upper Basin or the Lower Basin, either in stated quantities, percentages of flow, or otherwise. Nor did it allot any water to the United States in its proprietary capacity. The controversy as to the amount of water to be allotted to and to be used in specific States, had existed for years prior to the completion of the Compact and in the Lower Basin has continued to rage ever since. Recognizing this gap in the Compact, the Upper Basin States, with the consent and subsequent approval of Congress, agreed on a division of the water alloted to the Upper Basin among the several Upper Basin States. The Lower Basin States have never been able to agree on any phase of this problem. Hence, this litigation.

But it is inescapably true that the orderly development of the area served by the Lower Colorado River System, which is in the midst of one of the greatest population explosions in history, requires that there be an allocation of the mainstream water among the three States. We emphasize mainstream particularly because at the time of the enactment of this legislation, substantially all of the waters of the tributaries in Arizona and Nevada had been already appropriated, and California is devoid of tributaries. So that the *res* of the problem is necessarily the water flowing in the

mainstream, and that the tributary uses, although contained in the Compact definition of the division between the Basins are, as the Special Master logically finds in his Report, of no concern in the decision of this case.

B. The California Limitation Act.

As a condition of the Project Act, including the therein contained approval of the Compact becoming effective, the Congress included the provision that in the absence of ratification by all seven States, California must pass a specifically described Act limiting forever its claim on the water from the Colorado River. We concur in the Special Master's description of this as a condition precedent.

California, for many reasons, had for years prior to the signing of the Compact and the enactment of the Project Act, been the driving force in attempting to secure its enactment. This is very evident from the evidence herein and from the legislative history of the continuing effort through many sessions of Congress to assure the passage of an act similar to the final Project Act.

This was due to many reasons. The great irrigated Imperial Valley was suffering many woes due to the erratic flow of Colorado River. It could never be sure at any time whether it was going to suffer from disastrous floods such as those of the early 1900's that nearly resulted in turning almost the whole thereof into a great inland sea with incalculable destruction, or frequently appearing periods of drouth during which, at times, there was not adequate water for irrigation. In addition to these troubles arising from the uncontrollable forces of nature, the same area was beset with international woes. The only method of transporting Colorado water to this area was through a canal which looped southward into Mexico before re-crossing the International Boundary

in its northward flow to the Imperial Valley. Extreme demands were being made by Mexican land owners as to the amount of water they could divert for their uses from this canal while flowing through their country and obviously no American authorities had any control over this section of the canal or effective means of preventing diversion of water therefor.

Also, it was very evident that the coastal region around Los Angeles was in immediate need of the vast quantities of hydro-electric power which would be provided by Hoover Dam and that the same region would soon require the diversion of Colorado River water for domestic and municipal uses.

All of these reasons were very real and very cogent. California promptly passed the Limitation Act and in the years since, the State of California has reaped rewards of incalculable value as a result of the developments on the Colorado River which she thus made possible.

The subsequent attempts of California to evade the provisions of this Limitation Act or to reduce its effectiveness by proposed technical construction that would render it rather meaningless, come with poor grace from a sovereign State.

As we have noted heretofore, the alignment of the parties in this case has resulted in a situation in which California is taking one position and all of the other parties, while not agreeing among themselves as to all details, are united in supporting the basic decision contained in the decree recommended by the Special Master. California has no standing to in any way attempt to destroy, evade or diminish the limitation placed upon her use of Colorado River water (from the mainstream, which is the only place which she ever has diverted, or could divert) by the Limitation Act.

In Nevada's opinion, the Special Master has been generous to California in his application of the provisions of that Act. In brief,

that Act provided that California was limited to a total of 4,400,-000 acre feet of the water apportioned to the Lower Basin by Article III(a) of the Compact, and one-half of any excess or surplus water. Article III(b) of the Compact apportioned an additional 1,000,000 acre feet of water to the Lower Basin. There is much reason to contend that this additional 1,000,000 acre feet apportioned to the Lower Basin by Article III(b) water is not excess or surplus water, and Nevada so argued in her briefs herein. However, the Special Master has concluded that the portion of the water allotted to the Lower Basin by Article III(b) is excess or surplus water and has awarded one-half thereof to California.

This interpretation of the Limitation Act gives to California the maximum amount of water which it could take from the Colorado River. Certainly that State is in no position to complain as to that part of the Special Master's recommended decree and the limitation on California's diversions prescribed by him should be given effect in any decree that may be entered herein.

C. The Boulder Canyon Project Act.

The basic Act which became effective after the passage of the Limitation Act and which permitted the six-state Compact to become effective was the Project Act. Its basic purpose was to authorize and provide for the construction of Boulder Canyon Dam and the All-American Canal, together with provision for all of the attendant facilities, methods for repayment and management and control of all of the various structures. The portion of the Act dealing with the hydroelectric generation facilities and the sale of the power and energy produced are not in issue here.

The Special Master has determined that because of the provisions of Sections 1 and 6 of the Project Act which list, among the purposes of the legislation that of improving navigation, that

Congress accepted the invitation contained in the last sentence of Article IV(a) of the Compact and disagreed with the statement in that Article that the Colorado River had ceased to be navigable and that the use of waters for navigation should be subservient to other uses.

The Project Act provided for the construction of a dam which would, both because of the terms of the Act and of the inevitable results of its physical capacity impound and control all waters of the main Colorado River reaching that point. By the terms of Section 5, the Secretary of the Interior was particularly instructed to contract for the storage of water in the reservoir and for delivery thereof at various points on the river. And it particularly provided, "And no person shall have or be entitled to have the use for any purpose of the water stored as aforesaid, except by contract made as herein stated."

It was additionally provided in Section 14 that the Act should be supplementary to the general Reclamation Law and that that law should govern the construction, operation and management of the works herein authorized, except as otherwise therein provided. The historical pattern followed under the general Reclamation Law has, of course, been one in which the Secretary has contracted for the delivery of specific quantities of water to the various entities who would be entitled to divert and use them. Without exception, this has been the plan followed on all of the irrigation projects constructed by the Bureau of Reclamation, the greatest builder of dams and irrigation systems throughout the arid Western States.

As to these portions of the Project Act, there has not been and cannot be any particular controversy. The record herein is replete with references to quotations from the legislative history relating to the passage of the Project Act. The Special Master, in turn, quotes at length therefrom in his Report. Arizona and California

attempted to derive contrary conclusions from the legislative history, but it is certainly true that the history unequivocally shows that the Senators from the affected States believed that the Act would result in the ultimate division of the water which would reach Hoover Dam and be stored in the reservoir behind it, among the three Lower Basin States of Arizona, California and Nevada. And in voting upon the complexity of amendments to the portion of the Act which is now Section 4, they unquestionably believed that they were taking effective action on the amount of water which California would have as a prior right and thus guarantee the allocation of the balance available to the other two States. Specific votes were held on these questions.

We do not at this point discuss in detail the thoughtful reasoning of the Special Master wherein he finds that the provisions of this Section constitute a statutory allocation of the mainstream water. There is much reason and logic to sustain the Special Master's position. But in view of the provisions of the Act itself, with reference to the contracting of the water resulting from the construction of Hoover Dam and of the subsequent actions of the Secretary of the Interior, it is Nevada's position that the rights of Arizona and Nevada to receive as sovereign States amounts of mainstream water in the quantities specified in their respective contracts can be sustained on other grounds as well.

Aside from its power under the Commerce Clause of the Constitution, there can be no question now of the right of the United States to construct Hoover Dam and to create the resulting storage behind it for irrigation uses under the General Welfare Clause of the Constitution. *United States* v. *Gerlach Livestock Co.*, 339 U.S. 725, 738 (1950); *Ivanhoe Irrigation District* v. *McCracken*, 357 U.S. 275, 294 (1958). Conceding the navigability of the Colorado River,[27] clearly the United States, under the Commerce Clause, had the right to construct and

operate dams, and control and dispose of the waters of the Colorado River regardless of prior rights. *Arizona* v. *California*, 283 U.S. 423 (1931); *United States* v. *Twin City Power Co.*, 350 U.S. 222 (1955); *United States* v. *Chandler-Dunbar Co.*, 229 U.S. 53 (1912); *United States* v. *Rio Grande Irrigation Co.*, 174 U.S. 890; *United States* v. *Appalachian Power Co.*, 311 U.S. 377, 426 (1940). It follows the United States having expended money to impound the waters and having obtained physical control of it had the right through its properly authorized officers—in this case, the Secretary of the Interior—to specify the quantities of water to be delivered and the conditions for its use. *Ivanhoe Irrigation District* v. *McCracken*, 357 U.S. 275, 295 (1958); *United States* v. *Gerlach Livestock Co.*, 339 U.S. 725. In the *Ivanhoe* case, at page 295, the Court said:

> "Also beyond challenge is the power of the Federal Government to impose reasonable conditions on the use of federal funds, federal property and federal privileges * * *. The Federal Government may establish and impose reasonable conditions relevant to federal interest in the project and to the over-all objectives thereof."

In view of this basic situation, regardless of the specificness of directives to the Secretary of the Interior, contained in Sections 4 and 5 of the Project Act, the Secretary had the basic right and obligation under the general Reclamation Law[28] to make contracts for the disposition of the stored water. In no other

---

[27]It was Nevada's position in her briefs before the Special Master that the Colorado River was no longer navigable and the navigation servitude for all practical purposes was mooted. Nevada contended that Congress, in approving the Compact in the Project Act, had consented to Article IV(a) of the Compact which declares that the Colorado River is no longer navigable. The Special Master rejected that contention (Report, p. 151).

way could the highest and best use of the water be attained or the public interests be best served. The only question could be, then, as to whether or not the specific contracts entered into by him are invalid because of any abuse of discretion on his part. No one questions the validity of the contracts made with the various California agencies; although it must at all times be kept in mind that the total to be delivered thereunder cannot exceed the quantity to which California is entitled under its Limitation Act.

And certainly, there was no abuse of discretion on the part of the Secretary in contracting for the delivery of stored water with the respective sovereign States of Arizona and Nevada in the capacity in which he did for the use and development of those States. The legislative history of the attempts to have the Central Arizona Project authorized by the Congress clearly reveals the inescapable necessity of the Congress itself being advised as to the water rights available for a proposed project. There is nothing in the law which restricted the Secretary to make contracts only for projects then in being. In fact, the very essence of water developments in the arid West has been that of first being certain of the availability of water, then the authorizing, financing and construction of the projects. In some instances, this intervening period has been short, but in many instances, of large projects, a considerable number of years have elapsed before the completion of use.

Only after being certain that they would be entitled to specific quantities of water as expressed in their respective contracts could the States of Arizona and Nevada proceed with the planning, financing and construction of the projects which would use this

---

[28]See, for example, the Reclamation Project Act of 1939, Sections 9(d) and 9(e), 53 Stat. 1187, 43 U.S.C. 85.

water. In the case of Nevada, the acceleration of its growth has been comparatively recent. As shown in the record, however, at the present time, its rate of growth is one of the highest in the nation and the development is proceeding at a fantastic rate.[29]

Because of the physical fact that the Colorado River, at the points where Nevada can divert its waters, flows through a deep canyon, Nevada is confronted with a major development problem. It will take much time, planning and money to develop and complete the projects which will be eventually required to permit the use of Nevada's allotted share of water as her growth continues. It is submitted that the Secretary would have been guilty of an abuse of discretion if, in the light of his facts, he did not contract with the State of Nevada and its Colorado River Commission, the body authorized by the legislation of that State to represent it. And the quantity of water awarded Nevada is, as elsewhere herein noted, a bare minimum of the amount required.

D. Physical Background of the Suit.

Twenty-three years, nearly a quarter of a century, elapsed between the time of the enactment of the Project Act and the institution of this suit in 1952. During this period, many events occurred which have a bearing on the present controversy and which cannot be ignored in the decision herein. We have here perhaps another example of the situation where it is plain that the Court must consider all of the background of existing facts and circumstances.

Foremost in this array of events has been the completion of Hoover Dam itself, and the resultant control of all of the mainstream Colorado River at that point by that structure. Of equal importance has been the completion of the Imperial Dam which

---

[29] Appendix I, pp. 73–77, 81–87, 97–98.

diverts the water into its companion facility, the All-American Canal, both long ago completed and used for the diversion of the major share of California's portion of the Colorado River water. Imperial Dam is the lower-most American structure, and all water passing it is susceptible of use only in Mexico.

Between Hoover Dam, the uppermost reservoir in the Lower Basin and Imperial Dam, there have been completed a series of other dams which are in descending downstream order, Davis Dam, Parker Dam, Headgate Rock Dam, and Palo Verde Weir. All of these structures were constructed by the United States and are presently under the management and control of Federal officials. Collectively, these structures result in complete physical control by the United States of all the water entering into, stored in reservoirs on or diverted from the mainstream in the Lower Basin.

As a result of this complex of structures and projects, the Court now finds the mainstream water in the Lower Basin thus under physical control of Federal officials. And the accompanying situation is that these officials make the continuing determinations as to available total water supply, the amount available for various diversions and all other determinations affecting the control, management and delivery of the Colorado River water.

Also, during this period of more than two decades, the water delivery contracts were entered into with the California agencies which divert water for use in that State; with the State of Arizona and the presently operating agencies in that State who are now using water from the mainstream; and with the Colorado River Commission of the State of Nevada.

As to the State of Nevada, the situation is that that State has been for several years diverting a portion of the water provided for in its contract with the Secretary of the Interior. It has been necessary to construct expensive pumping facilities and pipelines

to bring the water from Lake Mead to the high adjoining plateau where it is required and is being used. The Nevada use under this contract is a constantly expanding one. Plans are under way for the additional facilities that will be required for the constantly expanding growth of the area.

Accordingly, we now find that dominion and control of the waters of the main Colorado River from Lake Mead to the Mexican border by officials of the United States is an accomplished fact. We find, likewise, that water delivery contracts which, as we have pointed out, were well within the power and discretion of the Secretary of the Interior, have been executed and in a very substantial degree actually operative for a considerable period of time. And with respect to Nevada, we find that she has, in reliance on her contract, spent large sums of money in beginning the process of providing facilities for and diverting water from Lake Mead for use by her citizens. True, Nevada's start has been slow, and compared with California's uses, small, but it is a fact which must necessarily be considered in rendering a decision as to the fate of the mainstream waters.

E. The Contracts May Be Properly Used as the Fundamental Basis for the Allocation of the Mainstream Water in This Suit.

Summarizing the foregoing discussion, it is very clear that the Compact, the Project Act, the Limitation Act, and the general Reclamation Law, together, form an integrated body of law which not only authorized but required that there be water delivery contracts relating to the mainstream waters available to the three Lower Basin States. In no other way could an effective plan for the delivery and use of those waters be attained. And this contractual arrangement has been actually brought into being and use in a very substantial degree.

Accordingly, Nevada submits that she, as a sovereign State should be awarded the amount of water provided in her contract, namely, 300,000 acre feet of consumptive use (diversions less return) of Lake Mead water, and furthermore, that this amount of consumptive use should not be in any way diminished or reduced by reason of other water uses in Nevada from the tributaries above Lake Mead.

The last proposition is mentioned because there would be such diminution of Nevada's rights to mainstream water if effect is given Article 5(a) of the Contract between the United States and Nevada.[30] This Article purports to reduce Nevada's 300,000 acre feet of mainstream water by the amount of Nevada's upstream diversions.

There is nothing in the Project Act that authorized or directed the United States officials to limit the Nevada use of Lake Mead water by deducting therefrom other Nevada diversions. Nor could the act of any Nevada official in signing such a contract be deemed to be a waiver or release of any rights which that State, as a sovereign, possessed. It is fundamental that State officials do not have any power to surrender, abrogate, release or dispose of any of the rights of a sovereign State. Accordingly, from every angle, the provision in the Nevada contract, purporting to whittle down the Nevada Lake Mead allocation of 300,000 acre feet by the amount of tributary diversions elsewhere in the State would be *ultra vires*, void and unenforceable. For that reason in any water supply computation based on contract rights, Nevada is entitled to the full 300,000 acre feet of Lake Mead storage water, as Arizona concedes.

Arizona is confronted by the same problem as a result of Article 7(d) of her contract with the United States. The Special

---

[30]Appendix 7, Report, p. 420.

Master has reviewed this problem at length in his Report at pages 237–247 and arrived at the proper and sound decision that such limitation provision is not only not supported by the Project Act, but, in fact, is contrary to the provisions thereof. He points out that such a provision can have no other effect than to violate the Project Act which provided that the water delivery contract should be "for permanent service." And also makes the proper comment that future upstream users would be in effect given priority over the older users under the Contract, if this paragraph were given validity. And he further points out that it is necessary to invalidate this paragraph in each the Arizona and Nevada contracts to be consistent with the real meaning of Section 4(a) of the Project Act as he interpreted it. Nevada, of course, concurs in the Special Master's Report and recommended decree in this respect.

IV.

THE RECOMMENDED DECREE IS IN REALITY AN EQUITABLE APPORTIONMENT OF COLORADO RIVER WATER

The decree proposed by the Special Master proposes a complete and efficient plan for dividing annually all available mainstream water among the three Lower Basin States.

There has been much controversy among the parties during the progress of this litigation as to the proper basic method of arriving at a decree to effectuate this purpose. Arizona and the United States urged a theory substantially like that adopted by the Special Master. California, while giving apparent lip service to a theory of equitable apportionment, such as has been followed in other interstate water cases in this Court, in reality, has at all times insisted on an allocation based upon actual appropriations and

uses under the laws of the various States. In effect, she was simply asking for a decree confirming existing appropriations only, but ignoring State lines. Nevada has urged that, as between sovereign States, the doctrine of equitable apportionment should apply, but departed from California's theory and urged that the Court could and should use its equitable powers in determining the share of water each of the Lower Basin States should ultimately be entitled to, and not limit allocations to the precise uses existing at the present time.

In his Report, the Special Master has pointed out precisely and in detail the reasons why and the method in which he has arrived at his decision. He has found specifically that the Project Act is the authority for the allocation and delivery of water[31] and that the principles of equitable apportionment or priority of appropriation which were found applicable in other suits for the interstate division were abrogated by the Project Act; and as also stated[32] "This case involves a statutory, not an equitable apportionment * * *." He has buttressed this basic conclusion by detailed analysis and reference to the legislative history of the Act and all of the surrounding circumstances, so that he came to the final conclusion that the intent of the Project Act was to make such a statutory allocation even though the literal words did not do so.

Nevada has complete confidence and respect in the determination of the Special Master and as has been noted, has not filed any exceptions to the basic provisions of his Report and proposed decree, but has only excepted to certain parts thereof not affecting the main conclusion.

However, being firm in her belief that this long existing controversy can and should be decided upon the voluminous record now before the Court, she urges that even should there be disagreement

---

[31]Report, p. 151.
[32]Report, p. 100.

with the Special Master's interpretation of the Project Act, that his proposed decree is in reality an equitable apportionment of the waters of the main Colorado River stream and can be completely justified on that ground. Assuredly, if the Special Master's determination, that this is a purely statutory allocation suit, is in error, then the only other alternative would be to treat it as an action for equitable apportionment. Viewed in that light the Master's proposed decree, is entirely correct and proper, fully supported by the evidence and a proper exercise of the judicial authority.

Suppose, for example, that the Project Act was not in existence but that the United States had constructed, under the general Reclamation Law, all of the Lower Colorado River dams, reservoirs and diversions which are now in existence. And let us further assume that under such law, the Secretary of the Interior had entered into the contracts which are before the Court in this action. Then we make the final assumption that the same parties as are now here, were before this Court asking for an equitable apportionment of the mainstream water.

In that situation, the Court would assuredly have to take into account the contracts. These contracts would be as much evidence of the rights of the parties to the mainstream water as any other water right they might present, whether State appropriations, actual use or whatever. The *res* of such a suit would be principally the waters stored in reservoirs constructed and managed by the United States. No decree could be entered effectively apportioning the water in question without taking into account these contracts.

The contracts would, indeed, be proper yardsticks to be used by the Court in determining the rights of the parties. The Report of the Special Master herein and his proposed decree can easily be justified, even aside from and different from the theory of

statutory allocation, on the ground that in reality, he did use these contracts as yardsticks to measure the rights of the parties, and so using them equitably apportioned the waters of the river.

We are not aware of any instance in any suit for interstate division of water wherein the Court has ignored, or found invalid, a water delivery contract made between the proper Federal agencies and a water using entity providing for the use and delivery of stored water.

As a matter of fact, the Special Master has recommended the use of the judicial power of the Court, in his determination that in years of shortage the water should be prorated among the States in the same proportion as their contract right bears to each other. And he has again used this judicial power in his provision that present perfected rights, protected under the provisions of the Compact, must be filled in order of their priority, even if it requires ignoring State lines.

In view of the foregoing, Nevada respectfully urges that the decision recommended by the Special Master can be completely justified and upheld as a valid equitable apportionment of the mainstream Colorado River water, consistent with the position that Nevada has taken throughout these proceedings.

V.

ARGUMENT IN SUPPORT OF EXCEPTIONS OF STATE OF NEVADA

i

*The Special Master erred in providing in Paragraph II(B)(7) of the proposed Decree (p. 349) that "mainstream water shall be delivered to users in * * * Nevada only if contracts have been made by the Secretary of the Interior pursuant to Section 5 of the Boulder Canyon Project Act for delivery of such water; * * *."*

Nevada requests that, by apt language, Paragraph II(B)(7) (Report, p. 349) be amended so that the phrase "mainstream water shall be delivered to users in * * * Nevada only if contracts have been made by the Secretary of the Interior pursuant to Section 5 of the Boulder Canyon Project Act for the delivery of such water; * * *" be amended so that this restriction (i.e., apparently requiring individual users to have contracts with the Secretary of the Interior) be not applicable within the State of Nevada.

This provision of the proposed decree, so far as relates to Nevada may be an inadvertence inasmuch as the Report itself (p. 210) finds that contract between the State of Nevada and the Secretary of the Interior "does not require additional subcontracts between each water user and the Secretary of the Interior."

The reason for this requested change is that the Nevada contract with the Secretary of the Interior is, on this point, distinctly different from the Arizona contract. While the Arizona contract provides in Section 7(1) (Report, p. 403) that

> "Deliveries of water hereunder shall be made for use within Arizona to such individuals, irrigation districts, corporations or political sub-divisions therein of Arizona *as may contract therefor with the Secretary*, * * *."

The Nevada contract is different in that it is a contract, directly with the State, acting through its Colorado River Commission, and makes no provision for what might be called "sub-contracts" with other users. It is stated in the Contract, Section 5(a) (Report, p. 410)

> "The right of the State to contract for the delivery to it from storage in Lake Mead is not limited by this Contract. * * *"

and also in Section 5(b) (Report, p. 411)

"(b) Water agreed to be delivered to the State hereunder shall be delivered * * *."

and it is further provided in Section 6 (Report, p. 411)

"The State shall receive the water to be diverted by or delivered to it by the United States under the terms hereof at the point or points of delivery to be hereinafter designated * * *."

And in Section 1 (Report, p. 412), it is stated:

"The water to be delivered to the State hereunder * * *."

And in Sections 8, 9, 10 and 11 (Report, pp. 412–413), it is provided that the State shall make the necessary reports, that the charges shall be made to the State, that the State shall pay for water delivered, and that deliveries to the State shall be refused in the event of a default.

All of this is in conformity with the contract itself which is made with the "State of Nevada, a body politic and corporate, and its Colorado River Commission (said Commission acting in the name of the State, but as principal in its own behalf as well as in behalf of the State; the term State used in this contract being deemed to be both the State of Nevada and its Colorado River Commission)," (Report, p. 409).

As mentioned in this contract, the Colorado River Commission of Nevada is a body politic, acting for the State. The Commission was established by the Legislature of the State of Nevada and the Act appears in Chapter 538 of the Nevada Revised Statutes, and specifically, Sections NRS 538.040–538.260, as amended. Pertinent parts of this legislation is set forth in Appendix II hereof. Specifically, Section NRS 538.160 authorizes the execution of a contract such as that involved in this action; Section NRS 538.170 authorizes the Commission to receive the water

covered by the contract for the State of Nevada and to make necessary appropriations therefor, and Section NRS 538.180 authorizes the Commission to make all necessary leases, sub-leases, or contracts of sale of the water obtained through the contract with the United States. As shown by the record herein, the State, through the Commission, has been the entity which has received the water available from Lake Mead and the Colorado River, paid the charges due the Secretary under said contract and made the necessary State appropriations therefor.

Nevada submits that to continue this program as conceived by the contract provisions is, in this instance, better both from the point of view of the United States and the State. In all probability, the uses in Nevada will be principally industrial, domestic or municipal. It is not a case of there being a comparatively few large irrigation or municipal projects, as in Arizona or California, but on the contrary, many small users. The Commission is constituted for the purpose, and can conveniently and efficiently perform the functions required by the United States in connection with the contract for Colorado River water, as well as best serve the interests of the users in the area.

It is submitted that this arrangement with Nevada in the contract is in accord with Section 5 of the Project Act (Report, pp. 384–385), and that the State of Nevada is a "person" as used in that section of the Project Act and, therefore, entitled to have the use of the water contracted for.

For the foregoing reasons, Nevada respectfully submits that there be the necessary changes in the language of Paragraph II(B)(7) (Report, p. 349), in conformance with the Special Master's finding in his Report (p. 210).

ii

The Special Master erred in finding in the Report, at pages 234 to 237, 311 and 312, and in Paragraphs II(B) (5) and (6) of the Recommended Decree, that a part of Nevada's allocation of water may be used to supply the so-called "present perfected rights" in other States, in years when the allocations of such other States are not sufficient to supply said rights.

And as an alternative, the Special Master erred in not providing a minimum figure below which the allocation of the State of Nevada could not be reduced, if, and when, it ever becomes necessary to take water away from Nevada's allocation for supplying so-called "present perfected rights" in other States.

By Paragraphs II(B)(5) and (6) (Report, pp. 348–349), a plan is outlined whereby one or two of the mainstream States shall make contributions to insure full delivery of present perfected rights to the third State, or to two States (II(B)(4)), and in the event of extreme shortage for the satisfaction of present perfected rights by priorities without regard to State lines (II(B)(6)).

Nevada submits that in the exercise of this Court's equitable powers, it should amend Paragraph II(B)(5) to provide that no part of Nevada's allocation of water may be used to supply the so-called "present perfected rights" in Arizona and California in years when the allocations of such States are not sufficient to supply such rights, or in the alternative, the decree should contain a provision providing that Nevada's deliveries shall never be reduced below a minimum figure (not less than 250,000 acre feet), provided there is present actual need therefor.

Such a requirement is necessary because, as is shown by the evidence herein, the Nevada users of mainstream water are, and

will be of the type which it is necessary to maintain, i.e., municipal, domestic or industrial. In other words, there will not be uses, such as irrigation uses, which can be temporarily suspended without disaster. Uses such as domestic and municipal cannot be arbitrarily cut off, or even heavily reduced, for a period of time, as can agricultural uses.

The factual situation presented is that out of the basic allotments, California will have present perfected rights approximating 70 percent or more of her total apportionment of 4.4 million acre feet; Arizona will have perfected rights constituting 21 percent or more of her apportionment of 2.8 million acre feet. While on the other hand, Nevada's mainstream present perfected rights are not in excess of 3 percent of her State allotments; and even this amount comprises solely the rights for the Fort Mohave Indian Reservation and the Lake Mead National Recreational Area.[33] In the event of a severe reduction in the amount of water released by the United States in any given year, a situation could arise, under the decree as now proposed, wherein all the water would go to the present perfected rights of California and Arizona and practically none would be available for Nevada.

It appears to Nevada that the present Report goes further than necessary in protecting present perfected rights as among the downstream States.

The only thing provided by Article VIII of the Compact (Report, p. 376) with respect to the priority of these rights is first, that they are unimpaired by the Compact (the Report has construed the Compact as being nothing more than an apportionment of water between the Basins and as being entirely irrelevant in the

---

[33]See Appendix III, p. 110, being a tabulation of "present existing rights" as of June 25, 1929.

apportionment of water among states); and secondly, that whenever a storage capacity of 5 million acre feet is available in the Lower Basin, present perfected rights must be supplied out of that storage as against appropriators or users in the Upper Basin.

The Project Act merely provides in Section 6 (Report, p. 387) that the dam and reservoir shall be used for the "satisfaction of present perfected rights in pursuance of Article VIII of said Compact * * *." In other words, it does not create any priorities as between downstream States, above and beyond that created by the Compact which, as noted above, have been determined to be non-existent. Neither does it pretend to assure such rights a better water supply than they had before the Compact.

Accordingly, it would seem that the decree as drawn is an exercise of the equitable power of the Court in providing for the priority of these present perfected rights as among the three downstream States and is not based on any specific statutory language, or authority. Accordingly, inasmuch as this portion of the decree is an exercise of this Court's equitable powers in that regard, it is fully within the power of this Court to provide that no part of Nevada's allocation of water shall be used to supply so-called "present perfected rights" in other states, or in the alternative, to place a floor, as suggested above, below which the deliveries to Nevada shall not be cut.

There will come a time in the future that some assured amount of water will be necessary for the very preservation of life and existence in the Southern Nevada area. On the other hand, assurance of this limited amount will not and cannot materially impair the much larger allotments (which are principally for agricultural use) in the other two Lower Basin mainstream States.

iii

The Special Master erred in failing to recommend in his Report, or provide in his recommended decree, for the appointment of a Commissioner with the power to supervise the operation of the Colorado River in the Lower Basin and the delivery, annually, among the various parties of the waters awarded to them by the decree herein (Report, p. 314).

Nevada, in its briefs before the Special Master, strongly urged that whatever course the decree of this Court might follow, there should be appointed a Commissioner by this Court to administer the decree. After careful analysis of the proposed decree recommended by the Special Master, we believe that the appointment of a Commissioner, an officer of this Court, is essential. Such a Commissioner would necessarily have to make annual determinations as to the amount of water that may be expected to be available, and the portion thereof which will be available to the three mainstream States in accordance with the basic decision recommended by the Special Master.

Nevada also recommended the appointment of an Advisory Board composed of representatives of each of the States of Arizona, California and Nevada to assist and advise the Commissioner, and we reaffirm that recommendation and recommend also that a representative of the Secretary of the Interior be made a member of that Board.

We believe it to be a logical solution of this case that there be made a basic allocation of water among the mainstream States such as the Special Master has recommended and that then this Court retain jurisdiction through its own Commissioner to make annual allocations in accordance therewith. Nevada submits that the allocations recommended by the Special Master, together with the continuing jurisdiction by a Commissioner, will result

in the highest degree of justice and in the most efficient division of the water among the parties to this action.

The proper utilization of mainstream waters available at Lake Mead and from Lake Mead to the International Boundary requires an annual determination of the amount thereof available on a basis of diversions less returns to the river with due consideration to Lower Basin inflows at Lee Ferry, inflows from tributaries between Lee Ferry and Lake Mead, mainstream reservoir and channel losses, deliveries to Mexico, regulation losses, storage on hand at Lake Mead and other factors including also the avoidance of greatly fluctuating supplies of water within the amount corresponding to the Compact apportionments to the Lower Basin.

The determination of annual water supplies available for use by the States of Arizona, California and Nevada, in accordance with the decree recommended by the Special Master should be made by a Commissioner appointed by the Court and should be annually announced by him at a designated time. Such Commissioner should have the authority and responsibility for the record of mainstream inflows at Lee Ferry and inflows from tributaries, the periodic determination of depletions by each State on the tributaries, the mainstream uses of water, and the submission of annual reports in appropriate number covering the activities described. The costs of such activities should annually be advanced by the States of Arizona, California and Nevada in proportion to the amounts of mainstream water allocated to them.

iv

The Special Master erred in failing to recommend in his Report or include in his recommended decree, provision for the promulgation of Rules and Regulations by the Officer in charge of operating the Colorado River, after the Decree is entered herein, setting forth in detail the manner, method and plan, including time schedules, to be used annually in

regulating stream flows, in managing and controlling regulatory structures and in allocating and distributing water to the parties entitled thereto; and also providing for cooperation with representatives of affected States in accordance with Section 16 of the Boulder Canyon Project Act (45 Stat. 457; 43 USC 617).

Nevada respectfully suggests that the decree specifically provide that the Officer in charge of operating the Colorado River, after the decree is entered herein, shall promulgate Rules and Regulations relating thereto. If this is done, all of the interested parties will be more aware of the planned procedure and activities, and it should tend to remove misunderstandings and possible friction. Generally, in the Western States, such Rules and Regulations are of material assistance in operating streams with complex and complicated rights thereon.

Some of the subjects which, among others, could very properly be covered by such Rules and Regulations, rather than in a more inflexible decree, are:

(a) The approximate time when the Secretary will annually announce to the interested parties the amount of controlled water that will be available for release in that water year.

(b) The definition of, and the manner of measuring those diversions which consist of wells in the mainstream valley so that they result in the diversion of water that is hydraulically connected with the mainstream flow.

(c) Provisional regulations concerning the manner and method of determining when contributions shall be made by each of the Upper and Lower Basins for the Mexican delivery in accordance with Article III(c) of the Compact; the point at which the Upper Basin contributions to Mexico shall be measured; and the manner and method of computing transportation; and evaporation losses thereon.

CONCLUSION

Nevada submits that the division of mainstream water proposed by the Special Master is a fair and just allocation and should be sustained. It is logical and proper.

Nevada is willing to accept the allocation of mainstream water proposed by the Special Master, even though Nevada's share is a bare minimum of the amount of water which will be required for existing and future uses.

The Special Master's proposed division of mainstream water can be sustained on any one of several legal theories. It can be sustained under the theory of statutory allocation adopted by the Special Master. In the absence of the Project Act, contracts, such as the one with the State of Nevada, would have been valid and could be judicially sustained, under the general Reclamation Law. Or if this action be considered one for equitable apportionment, it would be judicially proper to use the contracts made by the Secretary of the Interior, such as that with Nevada, as a yardstick, and evidence of the right to the use of mainstream water, which could and should be sustained in any decree entered herein.

Respectfully submitted,

ROGER D. FOLEY,
Attorney General

W. T. MATHEWS,
Chief Counsel

R. P. PARRY,
CLIFFORD E. FIX,
Special Counsel

Counsel for State of Nevada.

Dated May 15, 1961.

APPENDIX I

PRESENT AND FUTURE WATER REQUIREMENTS FOR COLORADO RIVER BASIN IN NEVADA

I.

GENERAL

Description of Colorado River System.

The Colorado River is one of the major stream systems of the United States, with its most northerly tributaries rising in the high mountains of southwestern Wyoming, eastern Utah and western Colorado. From there it flows southerly until it passes into Mexico and empties into the Gulf of California. Through many tributaries it drains southwestern Wyoming, the western slope of the Rocky Mountains in Colorado, eastern Utah and southeastern Nevada. Other tributaries arising in western New Mexico, flow westerly through the State of Arizona into the main stream. It forms part of the border between Arizona and Nevada and all of the border between Arizona and California.

Substantially the whole of the State of Arizona is within the Basin. While California borders the river, no tributaries arise in that State.

The Salton Sea, a below sea level depression or "dead sea," lies approximately 60 miles westerly of the main river, and approximately 50 miles north of the California Mexican boundary. During disastrous floods in the early 1900's, the whole river broke through canal headings, and for a time poured into this Sea instead of following its normal course to the ocean. At the present time, this Sea receives the waters of some streams flowing northerly from Mexico, and all of the drainage waters and return flow from the Imperial Valley Irrigation Project and the Coachella Project in California.

The areas adjacent to the river and its major tributaries are semiarid or arid in nature. The lands in these areas require the artificial application of water for the production of agricultural crops. In the southern part of the Basin, true desert conditions prevail.

The so-called Lower Basin area is in this southern desert portion. The climatic conditions in this area are such that the amount of Colorado River System water available in any given section will inevitably be the limiting factor on the future growth of that area, whether agricultural, industrial or municipal.

After leaving the southern boundary of California, the river for approximately 20 miles forms the boundary line between Mexico and Arizona (the limitrophe section). It then flows for approximately 75 miles through Mexico to its mouth at the Gulf of California. A great irrigated area in Mexico is dependent upon the waters of the Colorado River.

In this action there is involved that portion of the Basin of the Colorado River which is defined in the Colorado River Compact (Article II(g)) as the Lower Basin. There is, therefore, involved herein all of the waters entering the Lower Basin at Lee Ferry, the waters arising in all of the tributaries of the Colorado River whose mouths are below Lee Ferry, and all water entering or re-entering the main stream from any source between Lee Ferry and the International Boundary. Area-wise, the action affects all of the portions of the States which are party to the action from which waters naturally drain into the river below Lee Ferry, and also (as described in the Compact, Article II(g)), "* * * all parts of said States located without the drainage area of the Colorado River System which are now or shall hereinafter be beneficially served by waters diverted from the System below Lee Ferry."

Description of Colorado River Basin in Nevada.

The drainage basin may be described as follows: Starting in the southern-most tip and extending along the California-Nevada line about 45 miles to the summit of the McCullough range; then north along the summit of that range, and then northwesterly, crossing U. S. Highway 91 and along the summit of the Spring Mountain range through the Nevada National Forest just beyond Lee Canyon; thence in a northeasterly course, crossing U. S. Highway 95 a few miles south of Indian Springs and following a series of mountain ranges in the northeasterly direction to about 8 miles westerly of Caliente; then the drainage line takes a more northern course passing about 9 miles west of Pioche to a couple of miles south of the first standard parallel south; then a general easterly course to the State Line, and then down the Utah State Line about 9 miles to where the drainage divide comes back into the State of Nevada in a southwesterly direction and then turns back and hits the State Line just opposite Caliente; then down the State Line to the Colorado River and along the Colorado River 145 miles to the point of commencement. The length of the drainage basin is approximately 240 miles in a north-south direction line and about 90 miles at its widest point. It has an area of about 12,000 square miles and represents 5 percent of the area of the entire Colorado River Drainage Basin. It also represents about 11 percent of the total area of the State of Nevada.[1]

Principal Cities.

The principal cities in Clark County are Las Vegas with a population in 1956 of 48,500; North Las Vegas with a population of 12,900; Henderson with a population of 14,000; and

---

[1]Nev. Exs. 1 and 2, Tr. 16,204; Tr. 16,205–16,206; Appendix IV, p. 113.

Boulder City with a population of approximately 4,000. The principal towns in Lincoln County are Caliente and Pioche. The total population of the Colorado River Basin in Nevada was approximately 118,000 in 1957.[2]

Principal Railroads and Highways.

The main line of the Union Pacific Railroad serves most of the Colorado River Drainage Basin in Nevada. It extends from Los Angeles to Las Vegas, then northeasterly to Moapa, follows the Meadow Valley Wash to Caliente where it turns easterly and goes up the Clover Creek area into Utah. A few miles south of Las Vegas a branch line extends to Boulder City and Hoover Dam. A few miles further south another branch line runs from Arden to the Blue Diamond Gypsum Mine and plant. From Moapa a branch line runs down the Muddy River to Overton. At Caliente another branch line follows up the Meadow Valley Wash to Patterson Wash and over to Pioche and the Caselton Mines.

There is one transcontinental east-west highway—U. S. 91, which comes in from the direction of Los Angeles, passing through Las Vegas, Glendale and Mesquite, thence into Arizona, Utah and eastward. There are two north-south transcontinental highways—U. S. 95 and U. S. 93. U. S. 95 comes down from Oregon through Reno, Goldfield, Tonopah and comes through the Basin at about Indian Springs and to Las Vegas. It then joins with U. S. 93 at Railroad Pass, a point just westerly of Boulder City where it takes a southerly course through Eldorado Valley to Needles, California. U. S. 93 comes in from the eastern part, down from Idaho through Ely and comes in by Pioche, Caliente into Glendale, and then joins U. S. 91 to Las Vegas and 93 to

---

[2]Nev. Exs. 1 and 2, Tr. 16,206–16,207.

Railroad Pass. It then continues on to Boulder City and across Hoover Dam to Kingman and Phoenix.[3]

Description of River Systems in the Colorado River Basin in Nevada.

Virgin River: The principal tributary to the Colorado River in Nevada is the Virgin River. The Virgin River heads in southwestern Utah, takes a southwesterly course, and cuts across the northwest corner of Arizona in Mohave County, enters Nevada at about the location of the town of Mesquite and thence to Lake Mead. In Utah below the town of St. George the river enters a narrow canyon passing through the Beaver Mountains. This canyon, called the "Narrows," extends 17 miles in length. During the low flow of the Virgin River, which occurs from about May through October, very little of the natural flow gets all the way through the canyon. The irrigated land in Arizona and Nevada depends mostly on some saline springs, containing about 2,500 per million of salts, that rise just above the town of Littlefield. The Virgin River drains approximately 6,000 square miles, of which 2,900 are in Utah, 1,100 in Nevada, and 2,000 in Arizona.[4]

Muddy River: The Muddy River commences about where the second standard parallel south intersects the western boundary and about 15 miles above the confluence of Kane Springs Wash. The channel extends about 35 miles in a southerly direction and then turns easterly, then through the Moapa Indian Reservation and to Glendale where the Meadow Valley Wash joins the Muddy River. It then continues southeasterly to Logandale and Overton to Lake Mead. The drainage area of the Muddy River,

---

[3]Nev. Ex. 1, Tr. 16,204, 16,207.

[4]Nev. Exs. 1 and 2, Tr. 16,209–16,210.

excluding the Meadow Valley Wash, is about 1,650 square miles and prior to the construction of Lake Mead was tributary to Virgin River several miles below the town of Overton. At the present time it flows directly into Lake Mead rather than into the Virgin River. The flow of Muddy River originates in a series of thermal springs about 12 miles above Glendale. The springs are uniform month by month and year by year in flow with an average yearly flow of 34,000 acre feet. Two or three times each year minor storms above the Warm Springs contribute to the flow but such flows are of short duration and inconsequential. About once in every 10 years a large flood comes down, but for the most part the stream bed above Warm Springs is dry. The water from the Warm Springs contains about 700 parts per million of dissolved solids.[5]

Meadow Valley Wash: The Meadow Valley Wash stream system originates in Lincoln County near the first standard parallel north, runs south through Spring Valley and through a series of little valleys, through Condor Canyon to Panaca and along to Caliente. At Caliente it is joined by Clover Creek which drains the area toward the Utah boundary, and thence proceeds southerly some 70 miles to where it joins with the Muddy River at Glendale. The drainage area of the Meadow Valley Wash is 2,500 square miles. The flow of Meadow Valley Wash originates in Spring Valley through a series of springs which rise in an alpine meadow area. During the irrigation season this water is all used for irrigation in Spring Valley and in the three small valleys between Spring Valley and Panaca. Just above the town of Panaca in Panaca Valley there is a large spring flowing 8 second feet which furnishes most of the irrigation water for the Panaca area. Meadow Valley Wash is divided into Upper Meadow Valley Wash and Lower Meadow Valley Wash at

---

[5]Nev. Exs. 1 and 2, Tr. 16,230, 16,232.

a point on the Lincoln County and Clark County line. Meadow Valley Wash from Caliente to Glendale is usually dry from the latter part of April through December except when a cloudburst occurs.

Meadow Valley Wash below Caliente, and for a distance of about 70 miles, is a typical dry desert stream and under both conditions, i.e., those existing prior to the advent of man in the area, no material contribution of water was or is made from this stream to the Colorado River System; the only time water ever flows from the Meadow Valley Wash into the Muddy River and Colorado River is on rare occasions of unique desert storms and only then for brief periods of time. While the Meadow Valley Wash is a tributary of the Muddy and the Colorado and contributes occasional flood waters thereto, the irrigation uses on that stream do not affect the contribution to the main stream.[6]

Existing and Future Irrigation Uses in Colorado River Basin in Nevada.

The total area of land being irrigated in Nevada from the Virgin River in 1956 was 2,800 acres. Broken down into areas, the Mesquite Irrigation Company furnishes water for 1,360 acres, the Bunkerville Irrigation Company furnishes water for 960 acres, and the area below Bunkerville in the vicinity of the Riverside Bridge, and below, an additional 480 acres were being irrigated. Irrigation in this area started in 1865 and has been continuous since about 1880.

There are approximately 5,000 acres of irrigable lands not now being irrigated which are susceptible of irrigation from the Virgin River. Of this amount 2,200 acres are alluvial slope lands consisting of about 300 acres in the Mesquite area, 310 acres

---

[6]Nev. Exs. 1 and 2, Tr. 16,252–16,255; Tr. 16,274, 16,282–16,289.

in the Bunkerville area, and approximately 1,590 acres between Riverside and Lake Mead. In addition there are 2,800 acres of bottom lands along the Virgin River which can be reclaimed. Phreatophytic growth on the river bottom lands now consumes about 5 acre feet per acre. These lands, when reclaimed and placed into cultivation, would save or salvage as much as 80 percent of that present use. In other words, only about 20 percent more water would be needed for cultivated crops.[7]

The beneficial consumptive use requirement for the total of 7,800 irrigated and irrigable acres would be 36,496 acre feet.[8]

The total number of acres being irrigated from Muddy River in 1954 was 5,240 acres. Areas irrigated from the Muddy River are divided into the Upper Moapa Valley and the Lower Moapa Valley. Of this amount, 1,860 acres were located in the Upper Moapa Valley and 3,380 acres were located in the Lower Moapa Valley. Of the 1,860 acres irrigated in the Upper Moapa Valley, 355 were on the Moapa Indian Reservation. With the exception of 350 acres of land being irrigated in the Overton Wildlife Management Area, all lands irrigated in the Lower Moapa Valley are served by the Muddy River Valley Irrigation Company. Irrigation was first started on the Muddy River in 1865 by Mormon colonists from Utah. They settled at St. Thomas, a community that is now covered by Lake Mead. In 1870 the colonists were recalled and did not return until about 1881 and there has been irrigation continuously since that time.[9]

In the Moapa Valley, consisting of three units—Upper and Lower Moapa Valley and Lower Meadow Valley Wash—there are 7,180 acres of irrigable land not now being irrigated. Of this

---

[7]Tr. 16,404–16,405, Nev. Ex. 201, Tr. 16,401; Nev. Ex. 209, Tr. 16,467.

[8]Nev. Exs. 208, 209, 210, Tr. 16,451–16,457.

[9]Nev. Ex. 34, Tr. 16,328; 16,237–16,241.

amount 1,830 acres of irrigable land in the Upper Moapa Valley are susceptible of irrigation from the Muddy River and by pumping from underground sources. The Lower Meadow Valley Wash has no irrigation at the present time. There are approximately 5,000 irrigable acres but, because of the elevation of the upper end, only 3,030 acres in the lower end are considered feasible for irrigation. Water for these lands would be furnished on an exchange basis. Water now used in the Lower Moapa Valley could be diverted by gravity to the irrigable lands in Lower Meadow Valley Wash and water would be pumped from Lake Mead to lands in Lower Moapa Valley now being irrigated from the Muddy River. There are 2,325 acres of irrigable land in the Lower Moapa Valley susceptible of irrigation. The source of water would be Muddy River and water saved by better utilization of the present supply, better management and better systems of irrigation. It would also be feasible to pump water for irrigation from Lake Mead.[10]

The total beneficial consumptive use requirement for the 12,425 irrigated and irrigable acres would be 52,273 acre feet.[11]

There are 5,050 acres now irrigated in Upper Meadow Valley Wash. As heretofore pointed out (*supra*, p. 68), however, the water used for irrigation is not Colorado River System water. In addition there are 1,840 acres of irrigable lands which may be feasibly irrigated from the existing water supply. There is a much larger area of irrigable land but no available water for irrigation other than the 1,840 acres. The total beneficial consumptive use requirement for the 6,890 acres of irrigable acres would be 21,480 acre feet.[12]

---

[10]Tr. 16,423, 16,424, 16,426, Nev. Ex. 201, Tr. 16,401.

[11]Nev. Exs. 208, 209, 210, Tr. 16,451–16,447.

[12]Tr. 16,436, Nev. Ex. 201, Tr. 16,401; Nev. Exs. 208, 209, 210, Tr. 16,451, 16,457.

There are two units in the Fort Mohave-Big Bend area. The upper, or Big Bend unit, consists of 500 irrigable acres. The lower, or Fort Mohave unit, consists of 1,600 irrigable acres of public domain lands and approximately 2,150 irrigable acres in the Fort Mohave Indian Reservation section. Water will be available by pumping from the Colorado River. There is no irrigation at the present time. The lands are now covered by a phreatophytic growth consisting of willows, cottonwood, mesquite, and various types of native vegetation. Approximately 15,000 acre feet is now being consumed by this phreatophytic growth. These lands, when reclaimed, would save or salvage about 80 percent of the present nonbeneficial use. In other words, only about 20 percent more water would be needed for cultivated crops.[13]

The total beneficial consumptive use requirement for the 4,039 irrigable acres would be 16,217 acre feet.[14]

There were 2,150 acres being irrigated in Las Vegas Valley in 1954 from underground water sources with a diversion requirement of 15,179 acre feet. There is no return flow and there is no irrigation from surface sources. The ground water used for irrigation is not part of the Colorado River System. No portion of the Las Vegas ground water supply flows into or contributes to the water supply of the Colorado River System and none of the ground water used would have reached or contributed to the water supply of the Colorado River. It is not anticipated that there will be any increase in commercial irrigation in excess of the 2,150 acres now being irrigated in Las Vegas Valley.[15]

Future land and water usage in Las Vegas Valley, as well as Eldorado Valley, Apex Dry Valley, California Wash, Mormon

---

[13]Nev. Ex. 201, Tr. 16,401; Tr. 16,444–16,445, Tr. 16,447.

[14]Nev. Ex. 207, Tr. 16,451; Nev. Exs. 209 and 210, Tr. 16,461–16,467; Nev. Ex. 101, Tr. 16,383.

[15]Nev. Exs. 208 and 210, Tr. 16,467; Tr. 16,326; Nev. Ex. 601, Tr. 16,682; Tr. 16,709–16,711.

Mesa, and certain portions of Moapa Valley, hereinafter described, will be for industrial use and for small home site tracts and not for commercial irrigation.[16]

The total number of irrigated and irrigable acres susceptible of irrigation by existing water supplies from the Colorado River Basin in Nevada is 33,304 acres with a diversion requirement of 257,539 acre feet. The return flow would be 115,894 acre feet and the beneficial consumptive use would be 141,645 acre feet.[17] There is deducted from the beneficial consumptive use of 21,480 acre feet for irrigated and irrigable lands in Meadow Valley Wash and 15,179 acre feet being beneficially consumptively used in Las Vegas Valley since the sources of this water for irrigation make no contribution to the Colorado River System. There is also deducted 11,200 acre feet "salvaged" by reclaiming 2,800 acres of Virgin River bottom lands. The net amount of water needed by the year 2000 for the irrigated and irrigable acres in Nevada in the Colorado River Basin for beneficial consumptive use from the Colorado River System would be 93,786 acre feet.

II.

PAST AND PRESENT GROWTH IN LAS VEGAS VALLEY—CLARK COUNTY

The Las Vegas Valley which lies entirely within the boundaries of Clark County, is a northwest-southeast trending valley bounded on the West by the Spring Mountains, on the Northeast by the south parts of Desert Range, Sheep Mountain Range, and Las Vegas Range. The east part of the valley is bounded by Frenchman Mountain and a lower range of unnamed hills extending to Las Vegas Wash. The eastern boundary of the

---

[16]Nev. Ex. 211, Tr. 16,467.

[17]Nev. Ex. 210, Tr. 16,467; Tr. 16,284–16,288; Tr. 16,406.

valley floor is about 10 miles from the Colorado River. The south end of the valley is bounded by the River Mountains and the north extremities of the McCullough Range. The valley covers approximately 400 square miles.[1]

The large springs just westerly of Las Vegas are known as the Las Vegas Springs ("The Meadows" in Spanish), and were used as watering places by Indians long prior to the coming of white man. The springs were known to the Spaniards as early as 1770. The Mormons started settlement about 1855 but this was abandoned about 1857. After 1857, some use was made of the springs by others for agricultural purposes but the valley was sparsely settled until the early part of the 20th century. In 1905 the San Pedro-Los Angeles and Salt Lake Railroad, now the Union Pacific, was completed and Las Vegas was made a division point due to the excellent water supply from the springs. Shortly after that a subsidiary of the railroad company known as the Las Vegas Land & Water Company laid out the original townsite and built a water works system to attract workers and settlers to that area.[2]

The growth of the Las Vegas area during the past 25 years has been phenomenal. Las Vegas has grown from virtually nothing in 1905 to its present state of development. The townsite was laid out in 1905 after Las Vegas was selected as a division point for the San Pedro-Los Angeles and Salt Lake Railroad Company but it was not incorporated until 1911. The population census in 1910 showed a population of 800 in Las Vegas, and 3,331 for all of Clark County. The community grew slowly. The 1930 census showed 5,165 in Las Vegas and 8,632 in Clark County. The construction of Boulder Dam which commenced in 1930 accelerated its growth. In 1940 the population

---

[1]Nev. Exs. 1 and 2, Tr. 16,204; 16,295–16,296.
[2]Tr. 16,296–16,299.

of Las Vegas was 8,422, Boulder City 2,600 and Clark County 16,414.[3]

The accelerated growth commenced with World War II and has continued ever since. The Basic Magnesium Project was commenced in 1941. Following the close of World War II, Basic Magnesium, Inc. was acquired by Basic Management, Inc. which has contributed materially to the growth, not only to the City of Henderson, but the Las Vegas area. Nellis Air Force Base was constructed during the War and has increased in size since that time. During the 1940's the "Strip" resort hotels were commenced and there is now a 4-mile row of resort hotels. The population of Las Vegas increased from 8,422 in 1940 to 53,000 in 1956, and in Clark County from 16,414 to 115,000 during the same period.[4] The 1960 census showed a population in Clark County of 127,016.[5]

The City of Las Vegas is the principal residential area and trading center in Southern Nevada. It is located about 290 miles northeast from Los Angeles, about 450 miles south of Salt Lake City, Utah, and 330 miles northwesterly of Phoenix, Arizona. Los Angeles is the nearest center of large population. The city was incorporated in 1911 and now covers an area of 24 square miles. North Las Vegas, which joins the City of Las Vegas on the north, was incorporated in 1946 and it covers an area of 6¼ square miles. It had a population in 1956 of 12,900. The City of Henderson is located 12 miles southeast of Las Vegas adjacent to the Basic Management, Inc. plants. It was incorporated in 1953 and has an area of 13 square miles. It had a population of 14,000 people in 1956. Boulder City is located about 24 miles southeast of Las Vegas and is at the northern end of Eldorado

---

[3]Tr. 16,558–16,560.

[4]Nev. Ex. 401, Tr. 16,565; Tr. 16,560–16,561.

[5]General Population Characteristics, Final Report RC(1) 30B of the Department of Commerce.

Valley. It is the headquarters of Region 3 of the Bureau of Reclamation and the United States Department of Mines operates a research plant there. The population of Boulder City in 1956 was about 4,000.[6]

At least 30,000 people reside in the Las Vegas Valley outside of the incorporated towns. The centers of population outside of the incorporated towns are Paradise Valley, which is southwest of Las Vegas; the "Strip" area adjacent to U. S. 91 on the way to Los Angeles, and there are a large number of homesite tracts scattered around the valley in which several thousand people now live. The Nellis Air Force Base, which is the largest jet aircraft training center in the country, is located about 8 miles northeast of Las Vegas. Near this Base, the Navy has constructed the large Lake Mead Naval Ammunition Depot. Also, the proving ground of the Atomic Energy Commission, Frenchman's Flat, is located about 60 miles northwest of Las Vegas. The population of Clark County in 1956, was 115,000. The population in 1950 was 48,300. The percentage of growth has been 139 percent in six years.[7]

The phenomenal growth of the Las Vegas area is disclosed by the following growth statistics. The population of Clark County increased from 8,532 in 1930 to 16,414 in 1940, to 48,289 in 1950 and to 115,000 in 1956. Plane traffic has increased from 35,000 passengers in 1948 to 585,000 in 1957. Bank deposits have increased from $5,966,000 in 1941 to $105,380,000 in 1957; motor vehicles have increased from 8,000 in 1941 to 61,400 in 1958; property tax valuations have increased from $18,213,000 in 1941 to $224,200,000 in 1957; postal receipts have increased from $77,000 in 1940 to $1,069,000 in 1957; telephone service has increased from 1,808 in 1941

---

[6]Tr. 16,299–16,302.

[7]Tr. 16,299–16,302.

to 34,500 in 1957; school enrollment has increased from 2,500 in 1941 to 17,000 in 1957.[8]

III.

EXISTING WATER SUPPLY AND WATER USES IN LAS VEGAS VALLEY—CLARK COUNTY

Until construction of the Las Vegas Water District pipeline in 1956, the sole source of water supply for Las Vegas Valley other than the City of Henderson and the Basic Management, Inc. plants was from ground water sources. Until 1945, ground water use in the area was such that ground water sources were adequate. Since that time the population has increased so rapidly that the ground water basin is being depleted and is now greatly overdrawn.

The total discharge in 1956 from the ground water basin was 52,400 acre feet. The average annual replacement is 27,000 acre feet so that there is a present annual overdraft of 25,400 acre feet which must be replaced from water from Lake Mead.[1]

Of this amount 47,000 acre feet were beneficially used. There were 5,400 acre feet lost by "upward leakage" which could not be beneficially used. Of the 47,000 acre feet beneficially used, 30,704 acre feet were for municipal and domestic purposes, 1,126 acre feet for industrial purposes and 15,179 acre feet for irrigation.[2]

In recent years ground water use in the Las Vegas area has been supplemented by water pumped from Lake Mead through the BMI (Basic Management, Inc.) pipeline. In 1956, 24,370 acre feet were pumped from Lake Mead, and of this amount

---

[8]Nev. Ex. 401, Tr. 16,563.
[1]Nev. Ex. 33, Tr. 16,307, 16,322.
[2]Nev. Ex. 29, Tr. 16,314; 16,311.

1,770 acre feet were measured into the Las Vegas Water District pipeline to the Las Vegas area and used for municipal purpose. The sole source for industrial uses at the Basic Management, Inc. plants at Henderson is water from Lake Mead pumped through the BMI pipeline. In 1956 with the 21,700 acre feet pumped through the pipeline, 15,560 acre feet were actually used by the BMI industries. There were 4,370 acre feet used by the City of Henderson in 1956. Also, 2,670 acre feet were used by Boulder City through its own pipeline from Lake Mead.[3]

The total amount of water beneficially used in 1956 in the Las Vegas Valley, including Boulder City, from water pumped from Lake Mead and from the ground water basin for domestic and municipal purposes and for industrial uses was, exclusive of irrigation uses, 56,200 acre feet. Of this amount, 24,370 acre feet were pumped from Lake Mead—8,810 for domestic and municipal use and 15,560 for industrial use. The balance, 31,830 acre feet, was from ground water sources—30,700 acre feet for domestic and municipal uses and 1,130 acre feet for industrial use.[4]

IV.

APPROPRIATIONS FOR EXISTING AND FUTURE USE OF WATER IN CLARK COUNTY FROM LAKE MEAD

Prior to 1958, seven appropriations have been made for water from Lake Mead for use in Las Vegas Valley and two appropriations have been made for water from the Colorado River below Lake Mead. These appropriations were initiated by applications to appropriate to the State Engineer of Nevada. Permits

---

[3]Tr. 16,329; Nev. Ex. 504, Tr. 16,652, 16,849; Nev. Ex. 808, Tr. 16,834.

[4]Nev. Ex. 808, Tr. 16,834.

to appropriate have been granted, and in four cases, certificates of appropriation have been issued. The amounts of water total 163.5 c. f. s. or 118,365 acre feet. The names of the appropriators and the amounts appropriated are:

Name of Appropriator	Permit No.	Cert. of Approp.	Amount of Appropriation — Second feet	Amount of Appropriation — Acre ft. per year
Basic Management, Inc.	10779	3118	37.264	26,973
Western Electro-chemical Co.	10779	3118	7.736	5,598
Basic Management, Inc.	10779	3119	12.000	8,685
Reconstruction Finance Corp.	10861	4101	5.000	3,619
Las Vegas Valley Water Dist.	13424	.....	59.000	43,000
Maganese, Inc.	15571	.....	2.000	1,448
E. L. Cleveland	16489	.....	3.000	1,384
City of Henderson	16577	.....	34.500	24,971
River Valley Resort, Inc.	16822	.....	3.000	687
Totals			163.500	116,365

These appropriations are in good standing.[1]

In 1958, to-wit, on February 21, 1958, the Stauffer Chemical Company, National Lead Company and American Potash and Chemical Company, filed applications to appropriate 66,843 acre feet of water from Lake Mead for future industrial uses at Henderson. The names of the appropriators and the amounts appropriated are:

Applicant	Application No.	C.F.S.	Acre feet
Stauffer Chemical Co.	17494	13.270	9,589
National Lead Company	17495	65.760	47,523
American Potash & Chemical Co.	17496	13.464	9,731
Totals		92.494	66,843

[1]Tr. 16,330–16,334; Nev. Exs. 35 to 43, incl.; Tr. 16,331; Nev. Ex. 57, Tr. 16,354.

These applications for appropriation are in good standing.[2]

On March 5, 1958, the Colorado River Commission of Nevada, acting for the State of Nevada, filed on behalf of the people of the State of Nevada in trust seven applications to appropriate a total of 475,100 acre feet of water from Lake Mead for industrial, domestic and municipal, and irrigation uses for future use in Las Vegas Valley, Eldorado Valley, California Wash, Apex Dry Lake, Mormon Mesa, Moapa Valley and Fort Mohave. The application numbers and the amount applied for under each application are:

Application No.	Amount applied for (acre feet)
17500	225,000
17501	75,000
17502	100,000
17503	25,000
17504	25,000
17505	3,100
17506	22,000
Total	475,100

These applications for appropriation are in good standing.[3]

V.

PRESENT AND FUTURE INDUSTRIAL GROWTH IN CLARK COUNTY AND WATER REQUIREMENTS

There are a number of factors which have contributed to the phenomenal growth of the Las Vegas area. Its growth initially started with the construction of the San Pedro-Los Angles and Salt Lake Railroad which is the main line of the Union Pacific

---

[2]Tr. 16,334–16,336; Nev. Exs. 44, 45, 46, and 47; Tr. 16,336; Nev. Ex. 57, Tr. 16,354.

[3]Nev. Ex. 49 to 56, incl. for iden., Tr. 16,352.

between Los Angeles and the East. Important factors were the construction of Hoover Dam with resulting cheap power and ample water. Electric power made possible the development of the major industries at Henderson and additional ample power is available through the thermal generating stations. Natural gas is also available. The third factor was the government installations including Nellis Air Force Base, the Lake Mead Base, Atomic Energy installations, and the Basic Magnesium Project which was subsequently superseded by the Basic Management, Inc. industries at Henderson. Other factors are the tourist travel and recreational facilities. Las Vegas has become one of the great live-entertainment centers in the country and thousands of visitors are attracted there annually. Finally since World War II there has been a trend toward desert living. Air conditioning has made desert living attractive and comfortable and there are a number of large cities which have grown rapidly with adverse summer climates including Tucson, Phoenix, and Palm Springs, California.[1]

Industrial Growth Since World War II.

It is a matter of common knowledge that the industrial growth in the Las Vegas area since the beginning of World War II has been phenomenal.

While there has been some mining in the area, the major industrial growth commenced at the beginning of World War II. Basic Refractories, Inc. negotiated with the Defense Plant Corporation for the production of magnesium to be used principally in fire bombs. Basic Refractories, Inc. controlled large magnesite deposits in central Nevada. The Basic Magnesium plant was commenced in September, 1941, and the first magnesium was produced in September of 1942. In the fall of 1942

---

[1]Tr. 16,562–16,563.

Anaconda Copper Company replaced Basic Refractories as the managing and operating agents for the Basic Magnesium plant. The peak of production was in the summer of 1943. In the spring of 1944 cut-backs were ordered and on November 15, 1944, production of magnesium was concluded. During this period, 165,000,000 pounds were produced at Henderson making it the largest magnesium-producing plant during World War II.

The approximate cost of the plant was $135,000,000. The following year the War Production Board felt that the facilities should be kept in operation and the Stauffer Chemical Company leased part of the plant and continued the production of chlorine and caustic soda. Also the Navy Department entered into an agreement with Western Electrochemical Company to convert one of the 10 electrolytic metal buildings for the production of chlorates and perchlorates. In 1947 the plant was declared surplus. In April, 1948, the State of Nevada purchased the plant from the Federal Government and took possession. From April, 1948, until 1951 the Colorado River Commission of Nevada leased the remainder of the plant. The National Lead Company leased a large part of the buildings to join with the Allegheny Ludman Steel Corporation to form Titanium Metal Corporations of America. Also Combined Metals Production Company secured facilities and constructed two large electro furnaces for the production of ferro manganese and the U. S. Lime Products Corporation converted existing kilns to calcine lime and installed a hydrating plant. In 1952 the five companies negotiated with the State of Nevada for the purchase of facilities and formed Basic Management, Incorporated, to take over the residual assets and to own and operate the facilities. The townsite was sold to the residents in 1951 and 1952 and incorporated into a second-class city on June 8, 1953.[2]

---

[2]Tr. 16,632–16,636.

These industries were all in production in 1958. The Stauffer Chemical Company is producing chlorine and caustic soda. The Western Electrochemical Company which has been purchased by American Potash & Chemical Company produces perchlorates and electromatic manganese principally. It is the only major producer of ammonium perchlorates in the United States today. In view of the missile program it has a great potential future. The Titanium Metals Corporation owns approximately one-third of the plant area and their product is being used in the missile program and related fields. The price of titanium has gone from $250 pound when the plant first started producing titanium to $2.25 per pound, all in about 7 or 8 years. The United States Lime Production Corporation produce their own products locally and calcine lime for steel and agricultural industries in Southern California and also hydrate lime for the construction industry, a large portion of which goes to the Southern California market. Over the years they have averaged about 290 cars per month leaving the Henderson plant.

All of these industries are expanding users of Colorado River water.[3]

Another major industry in the Henderson area is the Manganese, Inc. mines located 7 miles northeast from Henderson from which up-graded manganese is shipped for the steel industries and for the strategic stockpile for the Government. Another major operation is Pabco, Incorporated, which has some gypsum deposits which are mined and the raw gypsum is ground and screened and shipped to California where it is made into wall board for the construction industry. The average annual employment for the Basic Management, Inc. industries has been 2,500 people during the past 5 years and the average payroll in

---

[3]Tr. 16,642.

excess of $12,000,000. The combined value of products produced exceeds $100,000,000 a year.[4]

Water from Lake Mead is supplied to these industries, and to Henderson, by a 40-inch pipeline 15 miles long with a present capacity of 67.7 second feet or 43.7 million gallons per day. This would be equivalent to about 50,000 acre feet per year. Not all of this water is available for use for industry and municipal use in the Henderson area. Under contractual arrangement between the Las Vegas Water District and Basic Management, Inc., the District has capacity rights up to the year 1990 for 15,400 acre feet annually. Basic Management, Inc. is also obligated to deliver up to 5,000,000 gallons per day to the City of Henderson but in the summer months has furnished as much as 8,000,000 gallons per day. In 1956 and 1957 water meters were installed in Henderson. The average per capita use in 1956 was 325 gallons per day. The City of Henderson used 4,370 acre feet in 1956. Manganese, Inc. also has a tap on the 40-inch pipeline at the Manganese plant and during 1956 was delivered 2,317 acre feet.[5]

The amount pumped from Lake Mead through BMI facilities has fluctuated extremely from 1942 to 1956. In 1943, 16,977 acre feet were pumped during the time the Manganese plant was in full operation. This dropped off sharply in 1945 after the curtailment of the production of magnesium during the period before new industries came into the area and reached a low of 4,512 acre feet in 1949. As the new industries came into operation it has now steadily expanded. In 1956, 21,700 acre feet were pumped. Of this amount 15,600 acre feet were actually used by the BMI industries.[6]

---

[4]Tr. 16,637–16,646.
[5]Tr. 16,646–16,649.
[6]Nev. Ex. 502, Tr. 16,648.

Future Industrial Growth.

The Las Vegas area will experience a tremendous industrial growth within the next 40 years. There are a number of factors which lead to this conclusion. The availability of power and water which attracted the existing industries will continue to attract other industries. More specifically, Southern Nevada enjoys the same climate and natural attractions which have led to large industrial growth in cities such as Phoenix and Tucson. In addition to the natural attractions of the desert as an ideal living area, there is sunshine 83 percent of the time and this is an important factor. This has a direct effect on construction costs, lost time due to inclement weather, and production of products which are sensitive to humidity. It is also ideal for outside storage which is a big economic factor.

Another factor is the availability of land. Large areas of land situated in remote areas yet having all the requirements for basic industries is an important factor. There are few areas available which offer all of the prerequisites for industry at a nominal cost and without being in a congested area as does this area. The already crowded condition in Southern California, coupled with the smog and water pollution problem, indicates an inevitable dispersal out of that area.

The accessible ores and minerals also will have an important effect on the industrial growth of Southern Nevada. As the population of Southern California and the Southwest continues to grow the 290 miles to Los Angeles becomes less important. There is now being shipped from Southern Nevada such relatively low cost items as ore, silica sand, stone and rock to the Los Angeles area. As manufacturing concerns produce products of relatively higher value to their weight, distance becomes less important. Adequate transportation facilities are already available in the area and can be readily expanded to meet future needs. Rail

service is provided by the main line of the Union Pacific Railroad Company. There are at least 15 trucking concerns operating in the area including several intercontinental lines.

Las Vegas is the focal point of air transportation in the Southwest. Three major air lines and two feeder lines serve Southern Nevada and make it easily accessible to the financing and manufacturing centers of the United States.

Adequate utilities are available. The area is served by progressive public utilities which insure adequate supplies of natural gas and electric energy at moderate rates. Both the electric and gas utilities have recently completed large expansion programs and have projected programs which will provide adequate service to take care of future growth.

Southern Nevada is attractive to labor supply. The general attractiveness of the area, and particularly Nevada's climate, has proved a strong attraction for bringing workers into the area. This is borne out by the fact that 80 percent of Nevada's increase in the past few years has resulted from immigration rather than from natural increase.

The tax and corporate laws of Nevada are attractive to industry. There is no state income tax and the property tax is considered the basic source of revenue for government functions. Nevada is the only state that has no inheritance or estate tax. Nevada has also recently enacted a free-port law which makes it an ideal location for the warehousing, the assembling and the serving of the West Coast market.

With respect to the type of industries which may be reasonably expected to locate in Southern Nevada, the most promising are made up of those concerns planning to serve the Southern California market. The most logical are those which may not want to locate in Southern California because of limitations on the availability of land, congestion, and air pollution. In Southern

Nevada industries with smog-producing operations can be so located as to take advantage of prevailing winds and keep living areas free of the nuisance. Also defense industries who must take into consideration dispersal because of possible air attack will find Southern Nevada an ideal location. The Department of Defense has designated Southern Nevada as an acceptable area for the dispersal of defense industries. Specifically, the most promising industries would be the chemical industries. There are now a large number of chemical products being produced and these chemicals and the mineral resources deposits provide the basis of a substantial expanding chemical industry.[7]

There are also good prospects of industrial development of the mineral resources of the area. There is a potential both in ferrous and nonferrous metals in the area. The suitability of Southern Nevada for steel mills seems particularly well adapted. The principal ores used in the manufacture of steel are available in the immediate area within economical shipping distance. There are large quantities of limestone that are used in the steel industry and substantially large coal reserves in Southern Utah. There are also locally basic materials for cement and cement products, gypsum products and glass products.[8]

Future Water Requirements for Industrial Purposes.

A conservative estimate of future water requirements for the present industries at Henderson by the year 2000 would be 90,000 acre feet. The major increases will be by American Potash & Chemical Company from a present requirement of 1,535 acre feet to 15,350 acre feet; Stauffer Chemical Company with a present requirement of 3,690 acre feet to 15,800 acre

---

[7]Tr. 16,653–16,662, 16,571–16,572, 16,898–16,912, 17,072–17,087.

[8]Tr. 16,714–16,736.

feet; and Titanium Metals Corporation with present requirement of 7,700 acre feet to 56,000 acre feet. These are realistic estimates. Each of the companies have made estimates based upon their present expanding programs.[9]

It is conservatively estimated that new industries will use 47,500 acre feet by the year 2000. This will be in addition to the 90,000 acre feet needed for existing industries, making a total of 137,500 acre feet needed for industrial use by the year 2000.[10]

In addition, at least 37,000 acre feet of water from Lake Mead will be needed for thermal power cooling purposes by the year 2000. The use of power in Clark and Lincoln Counties has increased tremendously during the past 20 years. In 1937, 26,000,000 kilowatt hours were used. In 1957 there were 1,419,000,000 kilowatt hours used, broken down into the following categories:

Residential: 318,600,000 kilowatt hours.
Commercial: 287,900,000 kilowatt hours.
Industrial: 735,200,000 kilowatt hours.
Miscellaneous: 77,400,000 kilowatt hours.

The increase has been steady except for the accelerated use during 1943–1944 when the Basic Magnesium Project was in full operation.[11]

It is estimated the power requirements for Clark and Lincoln Counties for the year 2000 will be 13,000,000,000 kilowatt hours. This was arrived at in two ways. The first one, a factor in percentage increase annually, starting in 1957, was applied to each category of use, to-wit: 6 percent annual increase to residential, 6 percent annual increase to commercial, 8 percent annual

---

[9]Nev. Ex. 504, Tr. 16,652, Tr. 16,651–16,652, 17,082–17,083.
[10]Tr. 17,082–17,083.
[11]Nev. Ex. 301, Tr. 16,513 and Nev. Ex. 304, Tr. 16,520.

increase to heavy industry, 8 percent to light industry, and 4 percent to miscellaneous classifications. In the second method, growth factors by classifications, using the same classifications that were used in the first were applied to the 1,415,000,000 kilowatt hours used in 1957. With respect to residential, assuming a six-fold increase in population by the year 2000, the factor of 12 is applied to the 319,000,000 kilowatt hours used in 1957, making a total use of 3,744,000,000 kilowatt hours. The growth factor of 12 was used for commercial use, 3.6 for heavy industry, 27 for light industry, and 3 for miscellaneous, making a total use by the year 2000 of 12,932,000,000 kilowatt hours.[12]

Power for future requirements for Clark and Lincoln Counties must come from thermal sources. There is no evidence that any further hydro sources will be available to the State of Nevada from the Colorado River. Approximately 12,000,000,000 kilowatt hours of the 13,000,000,000 kilowatt hours which will be required by the year 2000 must come from thermal sources.[13]

Approximately 37,000 acre feet of water from Lake Mead will be required for cooling purposes based upon an anticipated thermal development of 12,000,000,000 kilowatt hours by the year 2000. This is based upon the present rate of 1 gallon per kilowatt hour generated which is now being used by the Southern Nevada Power Company in their existing plants.[14] This 37,000 acre feet, together with the 137,500 which will be needed for existing and new industries, makes a total of 175,000 acre feet which will be needed for industrial uses. The estimated return flow will be 78,500 acre feet so that the net consumptive use for industrial uses by the year 2000 will be 97,000 acre feet.

VI.

AVAILABILITY OF LAND IN CLARK COUNTY, NEVADA, FOR INDUSTRIAL AND SMALL HOMESITE TRACT DEVELOPMENTS, AND WATER REQUIREMENTS

There are many large areas in the general vicinity of Las Vegas which are ideally situated and suited for industrial sites and small homesite tracts. The principal areas are Las Vegas Valley, Apex Dry Lake Valley, California Wash, Mormon Mesa, certain areas in Moapa Valley, and Eldorado Valley.

Soil surveys and land classifications based upon those surveys have been made in these areas. The land was classified into Capability Classes I, II, III, IV, VII and VIII. The first four are generally considered to indicate lands suitable for farming. Classes I, II and III, when properly managed, are capable of producing all climatically or adapted crops indefinitely in continuous rotation. Class IV is poorer land usually utilized in the production of hay or pasture when the land can be irrigated easily and water is plentiful. It ordinarily is not recommended for commercial irrigation. Capability VII is a range land classification and would be suitable for industrial sites or small homesite tracts. Class VIII is rougher, has little usable forage, and has substantially no range value, but to a more limited extent, would be suitable for industrial sites or small home sites.[1]

Referring first to Las Vegas Valley, for the purpose of the soil survey, it is the area surrounding the City of Las Vegas comprising 213,000 acres below the 2,500-foot contour and being appurtenant to the cities of Las Vegas, Henderson, Nellis Air Base, McCarran Air Field and the BMI plants.

The soil survey showed that there were 149,000 acres below

---

[1]Tr. 16,408–16,410, 16,437; Nev. Exs. 202, 203 and 204, Tr. 16,420, 16,440 and 16,443.

the 2,300-foot contour which is considered a reasonable pumping lift, being approximately 1,200 feet above Lake Mead. There are 27,000 acres in Capabilities I, II and III and 30,000 acres in Capability IV. The balance, 90,900 acres, are all in Class VIII. Between the 2,300- and 2,500-foot contour the land is similar to the land below the 2,300-foot, the only difference being the pumping lift. A considerable amount of land is being used for small homesites in this area and some of that is Class VIII land.[2]

With respect to the existing expanding small homesite tracts development, there are approximately 30,000 people now living in Las Vegas Valley outside of incorporated towns. Approximately 130,000 acres were in private ownership in 1956 and 86,000 acres of public land have been classified as open for small homesite tracts. The total acreage classified and proposed to be classified to be open for small tract filings is 93,500 acres; there were some 4,650 patents issued up to January 1, 1958, covering 14,000 acres; there is a total estimated number of leases outstanding of 18,000 and an estimated acreage under these leases of 54,000; and there are 8,217 pending leases and sales applications. Approximately 2,000 wells have been drilled on these small tracts alone.[3]

Apex Dry Lake lies several miles northwest of Las Vegas. It is a valley with interior drainage. In general, the soils are rather shallow, and somewhat sandy. In the center of the valley, surrounding a little dry lake, there is some very good soil, that has been classified as I and III which would be very good farm lands. There are 2,900 acres in Class I and 5,000 acres in Class III.

---

[2]Tr. 16,437–16,440; Nev. Ex. 203, Tr. 16,440.

[3]Tr. 16,300, Tr. 16,305–16,306, Nev. Exs. 27 and 28, Tr. 16,304, 16,306.

The balance, approximately 17,000 acres, is in Class VII and all below the 2,300-foot contour. This land is too shallow for commercial agriculture but it slopes well and would be desirable for homesite tracts.[4]

California Wash is a broad gentle sloping valley about 25 miles long just to the south and east of Apex Dry Lake. An intermittent stream drains to Muddy River, about two miles west of Glendale. There are 1,500 acres of Class I land, 6,500 acres of Class III, 2,000 acres of Class IV and 55,000 acres of Class VII, all below the 2,300-foot contour. All of the Class VII would be suitable for homesite tracts or industrial purposes.[5]

Mormon Mesa lies east of Glendale and west of Mesquite and about 65 miles from Las Vegas. It lies on both sides of U. S. Highway 91. It is table land, flat and generally sloping. It starts at an elevation of 1,800 feet at the rim on the south end and rises to 2,300 feet north of the highway. Some 4,000 acres have been classified as Class II land suitable for farming. The balance, comprising 82,000 acres, falls in Class VII. The soil is shallow but would be suitable for small homesite tracts or industrial sites.[6]

In Moapa Valley, in addition to the 7,185 acres classified as irrigable, some 20,000 acres have been classified as suitable for small homesite tracts and industrial uses.[7]

The most important area from the standpoint of immediate development is Eldorado Valley. Specific plans have been made

---

[4]Tr. 16,427–16,429; Nev. Ex. 202, Tr. 16,420; Nev. Ex. 211, Tr. 16,467.

[5]Tr. 16,430–16,431; Nev. Ex. 202, Tr. 16,420; Nev. Ex. 211, Tr. 16,467.

[6]Tr. 16,432; Nev. Ex. 202, Tr. 16,420; Nev. Ex. 211, Tr. 16,467.

[7]Tr. 16,424–16,427; Nev. Ex. 202, Tr. 16,420; Nev. Ex. 211, Tr. 16,467.

for the development of this area. Eldorado Valley, comprising some 125,000 acres, lies immediately southwest of Boulder City. In fact, Boulder City is in the upper north end of the Valley. Other than Boulder City there is no development in the area at the present time. A number of gold and silver mines in the adjacent Eldorado Canyon district have produced many millions of dollars.

The area is ideally suited for small homesite tracts and industrial site development. Soil surveys disclose that some 19,000 acres in classifications I to IV are suitable for farming, and some 47,000 acres in Class VIII suitable for small homesite tracts and industrial sites. There are many characteristics which make the valley attractive for this type of development. One is the proximity of Lake Mead, a few miles north of the valley, from where water may be obtained at a comparatively low pump lift. Utilities are readily available, including two gas lines and power lines which traverse the valley; weather conditions are ideal for small homesite tracts and for industry; recreation facilities are available at Lake Mead and Lake Mohave. Transportation is also readily available. A railroad traverses the northern end of the valley and there is a major highway traversing the north end of the valley to Boulder City, Southern California and Arizona.[8]

Recognizing the attractiveness of this area for development, the State of Nevada, through its Colorado River Commission, has taken definite steps for its development. On March 9, 1956, Governor Russell made an application to the Bureau of Land Management, pursuant to 43 C. F. R., Section 295.9, for the withdrawal and segregation of approximately 150,000 acres in Eldorado Valley. In his letter of application, the Governor pointed out this area was ideally suited for industrial and homesite tract development, stating:

---

[8]Tr. 16,356–16,357.

"One of the factors involved here is that if the State could obtain the land in the area, and with such land not being encumbered with land entries, the State could then plan an actual industrial development together with homesite and small tract areas."[9]

Following the granting of this application, the Congress of the United States, on March 6, 1958, passed an act (Public Law 85–339) directing the Secretary of the Interior to convey to the Colorado River Commission of Nevada the withdrawn lands in Eldorado Valley upon payment of their appraised value to the Federal Government. The Bureau of Land Management is now proceeding with the making of the appraisal.[10]

Also the Legislature of Nevada in 1957 passed the "Eldorado Valley Development Law" (NRS 321.390 to 321.470) which authorized the Colorado River Commission of Nevada, on behalf of the State of Nevada, to purchase or otherwise acquire from the Federal Government these lands, and authorized the appointment of an advisory group to the Commission to advise and assist the Commission in all phases of planning and development of Eldorado Valley. The Commission is also authorized, with the advice of the advisory group, to undertake such engineering and planning studies and surveys and to take such other action as may be necessary for the development of Eldorado Valley.[11]

The Colorado River Commission in Nevada has had an engineering study made of the proposed development of Eldorado Valley and the feasible location of pipelines and booster pumping stations for the transportation of water from Lake Mead to Eldorado Valley.[12]

---

[9]Nev. Exs. 59 and 60, Tr. 16,363; Tr. 16,358–16,363.
[10]Nev. Ex. 61, Tr. 16,363; Tr. 16,360–16,363.
[11]Nev. Ex. 62, Tr. 16,363.
[12]Nev. Ex. 407, Tr. 16,587.

The water system to serve this valley would consist of an intake pumping station located on the south shore of Lake Mead. It would lift water into a reservoir and a booster pumping station would pick up the water at that point and lift it to another booster station. From that point it would be delivered over a pass at an elevation of approximately 2,400 feet to a terminal reservoir located south of Boulder City. From there the water would flow by gravity to the valley area. The water system which has been studied would have a capacity of 25,000,000 gallons per day or 28,000 acre feet per year but it is not contemplated that the initial installation would serve the entire valley at its maximum development. The cost of the initial project is estimated to be $5,100,000. The cost of pumping the water is estimated to be $11.85 per acre foot for power and cost of water, and $16.15 per operation and amortization costs. This would amount to 8.4 cents for 1,000 gallons. This is a reasonable and feasible cost for water for domestic and industrial uses. In the center of Eldorado Valley there is a dry lake. The dry lake area would be reserved as a disposal area by leaching or evaporation of the waste water.

The valley has also been zoned for industrial and small homesite developments.[13]

Cost of delivering water to the Apex Dry Lake Valley area and California Wash and to the North Las Vegas area was also the subject of the study. An estimate was made of the cost of a pipeline which would deliver 25,000,000 gallons per day (or 28,000 acre feet per year) from Lake Mead to a junction point near Highway No. 91, just north of Lake Mead Base. The pipeline would deliver 15,000,000 gallons per day at that point into Apex Dry Lake Valley and 10,000,000 gallons per day along Highway No. 91, past Nellis Air Force Base, to North Las

---

[13]Tr. 16,582–16,587; Nev. Ex. 407, Tr. 16,587.

Vegas where it would connect with the Las Vegas Water District System. The elevation of the junction would be 2,175 feet and the summit over which the water would have to be delivered into Apex Dry Lake Valley would be 2,500 feet. It would flow by gravity from the junction to North Las Vegas. The cost of pumping water to the junction would be approximately $9.77 per acre foot for power and cost of water, and approximately $22.53 for operation and amortization of the project for a total cost of $32.30 per acre foot. The cost of pumping from the reservoir at the junction to the Apex Dry Lake Valley would be $4.88 for power and cost of water, and approximately $8.20 per acre foot for operation and amortization for a total of $13.08 per acre foot. The total cost, therefore, would be $45.38 per acre foot which is equivalent to 13.6 cents per thousand gallons. This is a reasonable and feasible cost for industrial and municipal use. After reaching Apex Dry Lake Valley, the water would flow by gravity to the California Wash area.[14]

The consumptive use requirement for small homesite tracts would be 5 acre feet per acre. Diversion requirement would be the same. There would be no return flow. In summary, 98,900 acres have been classified in Classes I to IV with a net usable acreage of 79,100 acres. A total of 324,000 acres have been classified as Classes VII and VIII with a net usable amount of 129,720 acres or a total of 208,820 acres of usable land. The consumptive use requirement for this acreage would be approximately 1,000,000 acre feet. This is exclusive of the land classified as irrigable for commercial farming in the Colorado River Basin in Nevada.[15]

VII.

POPULATION FORECAST FOR CLARK COUNTY BY THE YEAR 2000 AND FUTURE MUNICIPAL AND DOMESTIC WATER REQUIREMENTS

The Colorado River Commission of Nevada retained the internationally famous engineering firm of Tippetts-Abbett-McCarthy-Stratton of New York City to make a study with respect to the future economic growth of Clark County with resulting water requirements, including a population forecast to the year 2000. This firm was eminently qualified to make this study.[1]

Population Forecast to the Year 2000.

The year 2000 is a reasonable date upon which to base a population forecast. The population forecast can be made with reasonable accuracy for a period of at least 40 years.[2] A sound and reasonable forecast for the population of Clark County by the year 2000 is 600,000.[3]

This is a conservative estimate. During the past 97 years while the population of the Continental United States grew about 5½ times, the population of the eight Mountain States increased 36 times and Nevada has increased almost 39 times. Its population has grown 66.6 percent since 1950. Its population in 1950 was 160,000 and its population in 1957 was 267,000. Nevada's rate of growth is steeper than the United States, the Mountain States or the Western States. During the past 7 years it has grown faster than any state in the Union. Its population by the year 2000 is estimated to be 1,300,000. Since 1920 Clark County

---

[1]Tr. 16,744–16,748.
[2]Tr. 16,760.
[3]Nev. Ex. 801, Tr. 16,790; Tr. 16,765–16,790; Tr. 17,074.

has shown a steeper rate of increase than Nevada, Arizona, New Mexico or California. It has increased almost 35 times since 1910.[4]

As compared to rapid growing counties with like or similar climate, Clark County has shown a greater rate of increase than Los Angeles, Maricopa (Phoenix), Pima (Tucson), Bernalillo (Albuquerque). The average rate of growth conservatively forecast for Clark County by the year 2000 is slower than the long-term growth experienced by the above-named counties. The forecast for the year 2000 represents a maximum of 5.2 times the 1957 population. This is a slower rate of growth than is shown by the other counties between these same population figures of 115,000 and 600,000. While Clark County is expected to grow from one to the other level of that population in the period of 42 years, Los Angeles accomplished it in about 20 years and Maricopa County is expected to accomplish it in about 35 years. Expressing this comparison in still another way, the projection of Clark County population from 1957 to the year 2000 is at an average annual rate of increase of nearly 3.9 percent, while Los Angeles County covered the same range of population growth at an average rate of more than 8.5 percent per year, and Maricopa is expected to achieve it at an average rate of almost 5 percent.[5]

The average annual rate for the Clark County forecast for the 43-year period from 1957 to 2000 is 3.9 percent or approximately half the average annual rate for the 47-year period from 1910 to 1957. In comparable counties in the Southwest the average annual rate of growth in recent years has been from 4.2 percent to 6 percent.

---

[4]Nev. Ex. 801, Tr. 16,790; Tr. 16,779–16,780.
[5]Nev. Ex. 801, Tr. 16,790; Tr. 16,785.

Projection to the year 2000 assumes a continuation of present-day trends; continued technological advances in science and industry, steadily rising production and gradually increased leisure time and expendable income. Moreover, the projection for Clark County was based upon the assumption that its growth would not be hampered for lack of water. In the year 2000 the growth would be rising at a rate of 1.7 percent as compared with the present rate of 10 percent.[6]

It is estimated that the proportion of the 600,000 population forecast for the year 2000 that will be employed in manufacturing industries is 83 persons per 1,000 which would result in a figure of 50,000 employed in manufacturing by the year 2000. This compares with a national average of 100 up to 150 in highly industrialized areas and down to 50 to 60 in lightly industrialized areas. Of this 50,000 which is estimated will be engaged in employment in manufacturing, it is estimated that 7,000 will be employed in the existing Basic Management, Inc. industries; chemical industries 10,000; cement products 1,000; gypsum products 2,500; glass products 1,000; electrical machinery 3,000; fabricated metal products 4,000; instruments and related products 2,000; apparel 2,400; and accessory and miscellaneous industries, 24,000.[7]

Water Requirements for Municipal and Domestic Uses.

Municipal and domestic uses include all uses other than industrial, water for power cooling and water for commercial irrigation. The per capita use per day, for uses other than industrial uses, including power cooling and commercial irrigation, would be 525

---

[6]Tr. 16,785.

[7]Tr. 17,077–17,081.

gallons per capita per day, based on a population of 600,000 people by the year 2000 and which would require 353,000 acre feet per year. The present per capita use per day of water for municipal and domestic purposes, or for uses for everything other than industrial and water for power cooling is 370 gallons per capita per day. At the rate of increase of ¼ percent to the year 2000, this would amount to 450 gallons per capita per day. The current average increase of the Southwest at the present time is 1 percent per year. Included in this domestic and municipal use is use on 10,000 acres on small homesite land for suburban areas which will be in tracts from ½ to 1 acre in size. With the 5 acre foot duty per acre on the 10,000 acres, it would mean 50,000 acre feet per year, or 75 gallons per capita per day. This, added to the 450 gallons per day equals the 525 gallons. Some 2½ to 5 percent of the population represented by 200,000 families would live on such small homesite tracts. The estimated return flow from the use of water would be 38,000 acre feet. Therefore, the estimated net use for all domestic and municipal uses, other than industrial and water for power cooling purposes, would be 315,000 acre feet per year for a population of 600,000 by the year 2000.[8]

VIII.

SUMMARY OF PRESENT AND FUTURE WATER REQUIREMENTS FOR THE COLORADO RIVER BASIN IN NEVADA

The existing present diversions of water from all sources within the Colorado River Basin of Nevada is 167,060 acre feet. This is made up of 39,510 acre feet for domestic and municipal

---

[8]Tr. 17,082–17,087; Tr. 17,123–17,130.

purposes, which includes 8,810 acre feet from Lake Mead, and the balance of 30,700 from underground water in the Las Vegas Basin. There are diversions for industrial uses at the present time of 16,690 acre feet, which includes 15,560 acre feet diverted from Lake Mead, the balance from ground water. There are 110,868 acre feet presently being diverted for irrigation purposes. Of this amount, 15,180 acre feet are diverted from the underground water basin in Las Vegas; the balance of 95,680 acre feet from the Virgin River, Muddy River, and Meadow Valley Wash.[1]

In determining the estimated net consumptive use requirement for all purposes, the total diversion requirements are first determined and from this amount the estimated return flows are computed and deducted from the total diversion. The result is the net consumptive use from all sources.

The estimated gross diversion requirements for year 2000 for all uses within Clark County is 786,040 acre feet. This is made up of 353,000 for domestic and municipal which includes use on small homesite tracts; in fact, everything other than commercial irrigation and industry; 175,000 acre feet for industrial uses, and 357,540 acre feet for irrigation. With the return flows, the estimated net use for domestic and municipal, including all uses other than industrial and commercial irrigation, would be 315,000 acre feet; for industry 97,000 acre feet and for irrigation 141,650 acre feet, or a total net consumptive use of 553,650 acre feet by year 2000.

This is shown in tabular form as follows:[2]

---

[1]Nev. Ex. 808, Tr. 18,834, Tr. 16,832–16,834; Nev. Ex. 504, Tr. 16,652–16,653; Nev. Ex. 29, Tr. 16,314; Nev. Ex. 208, Tr. 16,467.

[2]Nev. Ex. 815, Tr. 17,166, Tr. 17,162–17,166.

Type of use	Estimated present diversion (acre feet)	Estimated gross diversion requirements by year 2000 (acre feet)	Estimated return flow (acre feet)	Estimated net use year 2000 (acre feet)
Domestic and municipal	39,510	353,000	38,000	315,000
Industrial	10,690	175,500	78,500	97,000
Irrigation	110,860	257,540	115,890	141,650
Totals	167,060	786,040	232,390	553,650

Of the 553,650 acre feet of net consumptive use of water in Nevada by year 2000, there should be deducted the average annual replenishment to the Las Vegas ground water basin of 24,500 acre feet which is not Colorado River System water.[3] Of this amount, 9,320 acre feet of ground water will be used for domestic purposes and 15,179 acre feet used for irrigation purposes.[4] This then leaves a net consumptive use of 529,150 acre feet.

In order to obtain the future estimated net consumptive use of water from Lake Mead, the figure of 529,150 acre feet must be further reduced by the net consumptive use on the tributaries. The Upper Meadow Valley Wash has a consumptive use of 21,480 acre feet for irrigation purposes which is not considered as Colorado River System water.[5] Also in the same category is 11,200 acre feet of salvaged water on the Virgin River bottom lands.[6] This reduces the future net consumptive use of water from the Colorado River System to 496,500 acre feet. This figure includes 65,000 acre feet of system water used for irrigation purposes from the tributaries. Therefore, the chargeable future consumptive use in Southern Nevada from Lake Mead

[3]Nev. Ex. 33, Tr. 16,322; Tr. 16,699.
[4]Nev. Ex. 210, Tr. 16,467.
[5]Nev. Ex. 210, Tr. 16,467; Tr. 16,272–16,288.
[6]Tr. 16,406–16,407.

will be about 431,600 acre feet. The 65,000 acre feet figure representing the future estimated consumptive use of system water from the tributaries for irrigation purposes is derived as follows:

	Estimated future consumptive use (acre feet)	Salvaged water (acre feet)	Lake Mead replacement water (acre feet)	Net consumptive system use (acre feet)
Virgin River	36,496	11,200	----------	25,296
Meadow Valley W.	21,480	21,480	----------	0
Muddy River	52,273	----------	12,696	39,577
Total				64,873
				(65,000)

In tabular form, the net consumptive use requirement from Lake Mead for Clark County by year 2000 is as follows:

From Lake Mead (diversion less returns)

Domestic uses	305,700 acre feet[7]
Industrial uses	97,000 acre feet[8]
Irrigation uses	28,900 acre feet[9]
Total	431,600 acre feet

[7]While the net consumptive uses for domestic purposes is 315,000 acre feet (Nev. Ex. 815, Tr. 17,166), this includes 9,320 acre feet of ground water in Las Vegas Valley which should be subtracted, leaving 305,680 acre feet needed from Lake Mead for consumptive use for domestic purposes.

[8]While the estimated gross diversions for industrial purposes by the year 2000 is 175,500 acre feet, the estimated return flow would be 78,500 acre feet, leaving a net consumptive use of 97,000 acre feet from Lake Mead (Nev. Ex. 815, Tr. 17,166).

[9]The future net consumptive use for irrigation purposes from Lake Mead for the Fort Mohave and Big Bend units ---------- 16,217 acre feet.

(There are two units of the Fort Mohave and Big Bend areas located in the southern tip of Nevada, comprising

A tabulation showing method of determining net consumptive use of water from Lake Mead follows:

4,039 irrigable acres none of which is irrigated now. Water will be available by pumping from the Colorado River. The diversion requirement would be 29,485 acre feet. The percentage of return flow is 45 percent or a total of 13,268 acre feet. The net beneficial consumptive use in acre feet would be 16,217 acre feet. Nev. Ex. 201, Tr. 16,401; Tr. 16,444–16,445, 16,447; Nev. Ex. 207, Tr. 16,451; Nev. Exs. 209–210, Tr. 16,461–16,467.)

Replacement water from Lake Mead to Lower Moapa Valley ..... 12,696 acre feet.

(It is proposed to pump 12,696 acre feet of Lake Mead water to the Lower Moapa Valley to replace water to be diverted to 3,030 acres of irrigable lands in the Lower Meadow Valley Wash area with a consumptive use of 4.19 acre feet per acre. Nev. Ex. 207, Tr. 16,451. The water need for consumptive use would be 12,696 acre feet. Tr. 16,424.)

Total future net consumptive use for irrigation purposes from Lake Mead ..... 28,913 acre feet.

While the estimated gross diversion for irrigation in Clark County by the year 2000 is 257,540 acre feet, with a net consumptive use of 141,650 acre feet (Nev. Ex. 815, Tr. 17,166), water for most of the increased irrigation use would not be from Lake Mead. The difference between 28,900 acre feet and 141,650 acre feet or 112,750 acre feet would be irrigation uses from the tributaries Virgin River, Muddy River, and Meadow Valley Wash and pumping in Las Vegas Valley.

TABULATION SHOWING METHOD OF DETERMINING NET CONSUMPTIVE USE OF WATER FROM LAKE MEAD BY YEAR 2000

Type of use (acre feet)	Estimated present diversion (acre feet)	Estimated gross diversion requirements by year 2000 (acre feet)	Estimated return flow (acre feet)	Estimated net use year 2000 (acre feet)	Estimated net use from Las Vegas ground water basin (acre feet)	Salvaged water on tributaries (acre feet)	Stream system water on tributaries (acre feet)	Estimated net cons. use of water for Lake Mead year 2000 (acre feet)
Domestic and municipal	39,510	353,000	38,000	315,000	9,320	----------	----------	305,680 (305,700)
Industrial	16,690	175,500	78,500	97,000	----------	----------	----------	97,000 (97,000)
Irrigation	110,860	257,540	115,890	141,650	15,179	32,680	64,873	28,918 (28,900)
Totals	167,060	786,040	232,390	553,650	24,499	32,680	64,873	431,598 (431,600)

APPENDIX II

COLORADO RIVER COMMISSION OF NEVADA

538.040 "COMMISSION" DEFINED. As used in NRS 538.040 to 538.260, inclusive, "commission" means the Colorado River Commission of Nevada.

538.050 CREATION OF COMMISSION; NUMBER OF COMMISSIONERS. A commission is hereby created, to be known as the Colorado River Commission of Nevada, consisting of five commissioners: The governor, and four commissioners to be appointed by the governor.

[Part 1:71:1935; 1931 NCL § 1443.01]

538.160 DUTIES OF COMMISSION. The duties of the commission shall be:

1. To collect and arrange all data and information connected with the Colorado River and its tributaries which may affect or be of interest to the State of Nevada.

2. To represent and act for the State of Nevada in the negotiation and execution of contracts, leases or agreements for the use or exchange of power and for the use of electrical generating machinery and power transmission lines both within and outside of the State of Nevada, but solely for use within the State of Nevada, and to present the same to the governor for his information and approval.

3. To represent the State of Nevada in such interstate or other conferences or conventions as may be called for the consideration of the development of reclamation and power projects connected with the Colorado River or its tributaries, or in connection with Boulder Dam or other federally operated dams.

4. To render the friendly cooperation of the State of Nevada to such constructive enterprises as look to the conservation of the waters of the Colorado River and its tributaries and the development of power thereon.

5. To render friendly cooperation to and to negotiate with, cooperate with, and invite industries for the purpose of establishing the same within the State of Nevada.

6. To negotiate with the representatives of other states and the United States in an endeavor to settle equitably and define the rights of the states and of the United States *in the water of the Colorado River and its tributaries.*

7. To make and enter into agreements, compacts or treaties between the State of Nevada and the States of Arizona, California, Colorado, New Mexico, Utah, Washington, Oregon, Idaho and Wyoming, either jointly or severally, which agreements, compacts or treaties, however, will not become binding upon the State of Nevada until ratified and approved by the legislature and governor of the State of Nevada.

8. To report to the governor such measures and legislative action as may be deemed necessary to secure to the people of Nevada all possible benefits from the water of the Colorado River allocated to or contracted by the State of Nevada and the power allocated to or contracted by the State of Nevada to be generated at Boulder Dam or elsewhere within the Colorado River stream system or from any private or federal power development upon other rivers in the western United States for use in the State of Nevada.

9. To cooperate with and to establish, conduct and maintain, in conjunction with other states or federal agencies, power, *water and irrigation projects.*

[Part 7:71:1935; A 1943, 209; 1947, 738; 1943 NCL § 1443.07]

538.170 COMMISSION TO RECEIVE, SAFEGUARD WATER, WATER RIGHTS AND POWER OF COLORADO RIVER.

1. The commission is empowered to receive, protect and safeguard and hold in trust for the State of Nevada *all water and water rights*, and all other rights, interests or benefits *in and to the waters of the Colorado River* and to the power generated thereon, now held by or which may hereafter accrue to the State of Nevada under and by virtue of any Act of the Congress of the United States or any compacts or treaties between states to which the State of Nevada may become a party, or otherwise.

2. Applications to appropriate such waters shall be made in accordance with chapter 533 of NRS and shall be subject to approval by the commission as set forth in NRS 533.370.

[Part 7:71:1935; A 1943, 209; 1947, 738; 1943 NCL § 1443.07]—(NRS A 1959, 555)

538.180 LEASES, SALES AND CONTRACTS OF POWER BY COMMISSION: PROCEDURE; NOTICE AND HEARING; APPLICANT'S BOND.

1. The commission shall hold and administer all rights and benefits pertaining to the distribution of the power mentioned in NRS 538.040 to 538.260, inclusive, for the State of Nevada, and is empowered to lease, sublease, let, sublet, contract or sell the same on such terms as the commission shall determine.

2. Every applicant for power to be used within the State of Nevada shall, before the application is approved, provide an indemnifying bond by a corporation qualified under the laws of this state, or other collateral, approved by the state board of examiners, payable to the State of Nevada in such sum and in such manner as the commission may require, conditioned for the full and faithful performance of such lease, sublease, contract or other agreement.

3. The power shall not be sold for less than the actual cost to the State of Nevada as determined by the Secretary of the Interior of the United States.

4. Before any such sale or lease is made, the same shall be advertised in two papers of general circulation published in the State of Nevada for a period of once a week for 2 weeks; and the commission shall require any person desiring to make objection thereto to file the objection with the secretary of the commission within 10 days after the date of the last publication of the notice. If any objection shall be filed pursuant to such notice then the commission shall set a time and place for a hearing of the objection not more than 30 days after the date of the last publication of the notice.

5. Any such lease, sublease, contract or sale, *either of the water* or power mentioned in NRS 538.040 to 538.260, inclusive, shall not become binding upon the State of Nevada until ratified and approved by the governor.

[Part 7:71:1935; A 1943, 209; 1947, 738; 1943 NCL § 1443.07]

538.190 COLORADO RIVER COMMISSION FUND: DEPOSIT OF REVENUES FROM SALE, LEASE OR USE OF WATER, POWER. All revenues derived from the *sale, lease or use of the water* or power derived from the Colorado River or its tributaries mentioned in NRS 538.040 to 538.260, inclusive, and all revenues which shall become due and owing to the State of Nevada under any such lease, contract or sale, or otherwise, within the Colorado River power and water system shall be received, collected and paid directly to the state treasurer and deposited by him in a fund, hereby created, to be known as and called the Colorado River commission fund.

[Part 7:71:1935; A 1943, 209; 1947, 738; 1943 NCL § 1443.07]

APPENDIX III

PRESENT PERFECTED RIGHTS AS OF JUNE 25, 1929

ARIZONA

North and South Gila Valleys	(1) [1]	23,900 AF (Ariz. Exs. 77A, 77B & 186)
City of Yuma	(2)	200 AF (Ariz. Ex. 190, Tr. 8867)
Yuma Project	(3)	164,700 AF (Ariz. Exs. 77B & 98)
Federal establishments		
Ft. Mohave Ind. R.		48,208 AF (Calif. Ex. 3517; U. S. Ex. 1322)
Colorado R. Ind. R.		331,201 AF (U. S. Ex. 592)
Cocopah Ind. R.		1,372 AF (U. S. Ex. 1009)
Total		569,581 AF, say 570,000 AF

CALIFORNIA

Palo Verde Valley	(4)	120,560 AF (Calif. Exs. 352 & 356)
Yuma Project, Bard Dist.	(5)	17,000 AF (Calif. Exs. 375 & 376)
Imperial Irr. Dist.	(6)	2,807,000 AF (Calif. Exs. 270 & 273)
Federal establishments		
Ft. Mohave Ind. R		6,849 AF (Calif. Ex. 3515, 3517, U. S. Exs. 1320, 1322)
Chemehuevi Ind. R.		6,237 AF (U. S. Ex. 1210)
Colorado R. Ind. R.		27,373 AF (Report pp. 271, 272; Tr. 14469–14470)
Yuma Ind. R.		25,808 AF (U. S. Ex. 1121)
Total		3,010,827 AF, say 3,011,000 AF

NEVADA

Lake Mead Nat'l. Recreation Area	(7)	2,000 AF (Report, p. 295)
Ft. Mohave Ind. Res.		6,267 AF (Calif. Ex. 3517, U. S. Ex. 1322)
Total		8,267 AF, say 8,000 AF
TOTAL ALL STATES		3,589,000 AF

(1) Arizona Ex. 186 shows for North Gila Valley an irrigated area of 1,800 acres in 1924 and 6,332 acres in 1952, with no intervening data. Arizona Ex. 77B, on page 43, shows for North and South Gila Valleys an irrigated area of 6,520 acres in 1929. Arizona Ex. 77A, page 95, shows a consumptive use of 19,685 AF for 5,552 acres irrigated in these valleys. The corresponding consumptive use for 6,520 acres would be 23,100 AF and with the addition of irrigation water used on the non-cropped areas from Arizona Ex. 77A, p. 109, the total would be 23,900. As Gila River is a mainstream tributary in this proceeding, such waters are a part of the mainstream supply.

(2) Yuma in 1929 was pumping from Colorado River (Arizona Ex. 190). The reported use of 260 million gallons for 1930, equal to 800 AF, is also considered applicable to 1929. A consumptive use of 25 percent is here applied.

(3) The Yuma Project in Arizona in 1929 comprised the Yuma Valley with an irrigated area of 43,440 acres and the Yuma Auxiliary Unit on the Mesa with 1,162 acres irrigated (Arizona Ex. 186). The valley area includes the small area of Cocopah Indian lands then irrigated. In 1929 and prior years, irrigation supplies for Yuma Valley and Yuma Mesa were measured at the siphon crossing Colorado River from the California side, with Mesa supplies pumped out of the Valley East Main Canal. Waters not consumed were either returned to the river through wasteways or delivered to Mexico users at the boundary. Such outflows are now fully used by Mexico as part of the Treaty delivery. Considering that Yuma Project reports on irrigated areas, in 1926 and prior years, duplicated double-cropped areas, the irrigated areas for the Mesa and the Valley from Arizona Ex. 77B, p. 43, and the inflows less outflows from Arizona Ex. 98 (U.S. G.S. Water Supply Paper 1313) were:

	1927	1928	1929
Irrigated Area	42,906 Ac.	44,053 Ac.	44,810 Ac.
Inflow less outflow	164,700 AF	152,300 AF	125,200 AF

(4) Cal. Ex. 356 shows a consumptive use of 120,560 AF for 1929 with 32,393 acres cropped. Cal. Ex. 352 shows 1926 with cropped area of 36,100 acres but using relatively less water.

(5) Cal. Ex. 375 shows the irrigated area on the Reservation Division increasing to 1926 and then declining; and with the Bard (non-Indian) District irrigated area 5,404 acres in 1924, and 5,055 acres in 1931. From these data the Bard area in 1929 is estimated at 5,600 acres. Cal. Ex. 376 indicates a consumptive use of 3.10 AF per acre for the Reservation Division, resulting in a consumptive use of 17,000 AF for the Bard District in 1926.

(6) Cal. Ex. 270 shows Alamo Canal diversions for 1929 to be the highest made to that time. Cal. Ex. 273 shows disposition thereof as:

	Units 1000 AF or Acres
Diversion to Alamo Canal at Hanlon Heading	3,423
Loss in main canals	261
Loss—Deliveries to Mexico	616
Total Main Canal Loss	877
Other System Losses Unaccounted For	325
Total System Losses and Unaccounted For	1,202
Waste for System Regulation	423
Deliveries to Users	1,798
Net Average Irrigated	424.1

The designation of Delivery to Mexico *as a loss* is improper for the purpose of arriving at Present Perfected Use as stream flow was sufficient to enable the District to divert more water if desired for its use. The "Main Canal Loss" applies to the Alamo Canal and the two main canals around the border of the District with very little of such loss occurring in the Alamo Canal which is an ancient natural channel of the Colorado River. The District use then becomes the Alamo diversion less deliveries to Mexico, being 2,807,000 AF. Included therein is 423,000 AF of regulatory waste, roughly 12 percent of the total diversion.

(7) The amount indicated is an estimate of foreseeable maximum uses.

SUMMARY OF THE ARGUMENT 24

I. The Water Dealt With by the Project Act and the Limitation Act 24

II. The Statutory Apportionment 27

III. Appropriative and "Perfected Rights" 30

ARGUMENT:

I—Congress in enacting the Project Act exercised its plenary power over navigable water and allocated among Arizona, California and Nevada all available water in Lake Mead and in the main stream of the Colorado River downstream from Lake Mead. Therefore, principles of equitable apportionment and priority of appropriation are not applicable to the division of main stream water among those states. 32

A. The Constitutional Power of Congress Over Navigable Waters 32

B. Provisions of the Project Act 35

C. Legislative History 38

D. Inapplicability of Principles of Equitable Apportionment 40

E. Effect on Appropriative Rights 41

F. "Present Perfected Rights" 46

G. Summary 56

II—The Project Act provides for the storage of main stream water only and for its allocation among Arizona, California and Nevada. 57

1. Interpretation of the phrase, "waters apportioned to the lower basin states by paragraph (a) of Article III" (Project Act §4(a)) 58

A. Provisions and Purposes of the Project Act 58

PAGE

B. Legislative History of §4(a) 61

C. The Water Dealt With By Article III(a) of the Compact 67

(1) The congressional interpretation of Article III(a) of the Compact is controlling. 67

(2) The Compact apportioned main stream water. 72

2. Interpretation of the phrase, "excess or surplus water unapportioned" by the Compact 81

A. Article III(b) water is apportioned main stream water in the Compact sense. 81

B. Section 4(a) of the Project Act treats Article III(b) water as "surplus". 82

III—The Project Act established a formula which governs the apportionment of main stream water among Arizona, California and Nevada and to which the water delivery contracts made by the Secretary of the Interior are required to conform. 83

A. The Formula Established by §4(a) 83

B. The Requirement of §5 That Water Delivery Contracts Conform to the Formula.... 84

C. The Water Delivery Contracts 99

(1) The Arizona Contract 100

(2) The Nevada Contracts 104

(3) The California Contracts 105

D. Meaning and Measurement of "Consumptive Use" 105

E. Release From Storage of Apportioned But Unused Water 106

PAGE

Part II

The Claims of the United States to Water 109

QUESTIONS PRESENTED 109

STATEMENT OF THE CASE 110

I. Claims of the United States to Main Stream Water 110

A. Indian Reservations 110
Colorado River Indian Reservation.. 110
Fort Mohave Indian Reservation..... 111
Cocopah Indian Reservation..... 113

B. Recreation Areas and Wildlife Refuges 114
Lake Mead National Recreation Area 114
Havasu Lake National Wildlife Refuge 114
Imperial National Wildlife Refuge.... 115

II. Claims of the United States to Tributary Water 116

Gila National Forest..... 116

SUMMARY OF THE ARGUMENT..... 116

ARGUMENT:

IV—After Arizona was admitted to statehood, the United States had no power to reserve water of the main stream of the Colorado River for the use of federal establishments within Arizona..... 121

V—No reservation of water of the main stream of the Colorado River has been made for the use of Indian Reservations in Arizona..... 125

A. Power of the United States to Reserve Navigable Waters Before Statehood..... 125

B. Power of the Executive to Reserve Navigable Water 129

C. Necessity for a Clear Manifestation of Intent to Reserve Navigable Water..... 135

PAGE

D. Lack of Evidence of an Intent to Reserve Water for Indian Reservations 139

(1) Colorado River Indian Reservation 139

(2) Fort Mohave Indian Reservation 148

(3) Additional Considerations Applicable to Both Reservations 150

E. Indian Needs, Rather Than Irrigable Acreage, the Correct Measure of Any Reserved Water Right 154

(1) Fort Mohave Indian Reservation 166

(2) Colorado River Indian Reservation 170

VI—Should the Court find there was no reservation of water for use on Indian Reservations, or, should the Court find such a reservation of water but reject Indian needs as the test of the quantity reserved, the amount of water to which the Reservations are entitled should be determined in accordance with principles of equitable apportionment. 181

A. Status of Indian Tribes as Quasi-Sovereigns 182

B. Applicability of Equitable Apportionment 184

C. Equitable Considerations 187

(1) Fort Mohave Indian Reservation 188

(2) Colorado River Indian Reservation 189

(3) Cocopah Indian Reservation 190

(4) Non-Indian Needs in Arizona 190

VII—In withdrawing public lands for the Gila National Forest the United States did not reserve water from the Gila and San Francisco Rivers for use in the forest 192

OPENING BRIEF FOR ARIZONA

This case of original jurisdiction comes before the Court in its final stage upon the Report and Recommended Decree

filed by Honorable Simon H. Rifkind, Special Master, and exceptions thereto filed by the parties pursuant to order of the Court dated January 16, 1961.[1]

Since the Report and Recommended Decree are for the most part favorable to Arizona, she moves their adoption by the Court, with such modifications as are requested in her exceptions.

JURISDICTION

Jurisdiction is based on Article III, §2, cl. 2 of the Constitution of the United States and is supported by decisions of this Court, including *Nebraska* v. *Wyoming,* 325 U. S. 589 (1945); *Colorado* v. *Kansas,* 320 U. S. 383 (1943); *Kansas* v. *Colorado,* 206 U. S. 46 (1907); *Kansas* v. *Colorado,* 185 U. S. 125 (1902), and *Missouri* v. *Illinois,* 180 U. S. 208 (1901).[2]

---

[1] The Special Master's Report is cited as "Rep."

The transcript of hearings before the Special Master is referred to as "Tr." The hearing exhibits are cited by number preceded by "SM" for the Special Master's; "A" for Arizona's; "C" for California's; "N" for Nevada's; "NM" for New Mexico's; "U" for Utah's; and "US" for those of the United States.

The exceptions to the Master's Report and Recommended Decree are referred to as "Exc." followed by the number of the exception and preceded by the appropriate letter to identify the excepting party (*e.g.*, "A Exc. 13" to cite Arizona Exception 13).

Submitted together with this brief in a separate volume is "Arizona's Legislative History of Sections 4(a), 5(1st paragraph) and 8 of the Boulder Canyon Project Act." This document will be cited "Ariz. Legis. Hist." followed by a page reference. It is substantially identical with "Arizona's Legislative History" submitted to the Special Master except for changes in pagination due to printing. In order that the Court, in reading the Master's Report may be able to refer to the Master's references to "Arizona's Legislative History", Arizona has preserved by bold face bracketed page numbers the pagination of the "Legislative History" as it was submitted to the Master.

[2] As the Special Master noted, the Court's jurisdiction was conceded by all parties (Rep. 129).

STATUTES AND BASIC DOCUMENTS

The case involves:

The Colorado River Compact, executed November 24, 1922, printed as Appendix A.[3]

The Boulder Canyon Project Act, enacted December 21, 1928, effective June 25, 1929, 45 Stat. 1057, as amended, 43 U. S. C. §§617-617u, printed as Appendix B.

The California Limitation Act (Act of March 4, 1929, Ch. 16, 48th Sess.; California Statutes and Amendments to the Codes, 1929, pp. 38-39), printed as Appendix C.[4]

Regulations of the Secretary of the Interior governing water contracts under the Boulder Canyon Project Act, printed as Appendix D.

The Arizona contract with the United States for delivery of water from Lake Mead dated February 9, 1944, effective February 24, 1944, printed as Appendix E.

The Nevada contract with the United States for delivery of such water dated March 30, 1942 and their supplemental contract dated January 3, 1944, printed as Appendices F and G, respectively.

Water delivery contracts between the United States and the defendant California agencies, all of which are essentially similar in form. The Palo Verde Irrigation District contract is a typical example of these and is printed as Appendix H.[5]

---

[3] Pages of the Appendices have been numbered page 1a through page 70a. References in the brief to the statutes and other documents printed in the Appendices will be to these page numbers.

[4] The Colorado River Compact, the Boulder Canyon Project Act and the California Limitation Act will be referred to as the "Compact", "Project Act", and "Limitation Act", respectively.

[5] The relevant statutes and executive orders creating federal establishments are too numerous for listing here and printing as appendices to this brief, but they are specifically referred to and, where appropriate, quoted hereafter.

NATURE OF THE ACTION AND PARTIES

Arizona commenced this action by leave of the Court (344 U. S. 919 (1953)) against California and certain political subdivisions of that state[6] to have determined the extent of Arizona's rights to the use of water within the Lower Basin of the Colorado River and its tributaries and for appropriate injunctive relief (Rep. 1-2).

The United States was permitted to intervene (344 U. S. 919 (1953)). Nevada likewise was permitted to intervene (347 U. S. 985 (1954)) and New Mexico and Utah were impleaded on motion of California to the extent of their interests as states of the lower Colorado River Basin (350 U. S. 114 (1955)).

Each party asserts claims to varying amounts of water of the Colorado River System in the Lower Basin.

SCOPE AND DIVISION OF THE BRIEF

As the Special Master noted, the case presents controversies regarding rights to the use of water of the Colorado River and its tributaries within the Lower Basin (Rep. 4-6).

The main stream controversy involves the conflicting claims of Arizona, California, Nevada and the United States to the use of water of the main stream of the Colorado River (Rep. 4-6).

---

[6] The defendants Palo Verde Irrigation District, Imperial Irrigation District, Coachella Valley County Water District and Metropolitan Water District of Southern California are political subdivisions and agencies of the State of California duly organized and existing under the laws of that state. The defendants City of Los Angeles and City of San Diego are municipal corporations organized under the laws of the State of California. The defendant County of San Diego is a county duly created under the laws of the State of California. These defendants and the State of California will be referred to as the California defendants.

The tributary controversy is in two parts: (1) disputes between tributary states and main stream states benefiting from tributary inflow and (2) disputes between tributary states *vis-à-vis* each other and between the United States and tributary states (Rep. 4-6).

The Special Master has reported, quite properly, that there is presently no occasion to apportion water of the tributaries in the Lower Basin between main stream and tributary states (Rep. 316-18).[7]

The controversies regarding tributary uses involve New Mexico, Arizona and the United States as to the Gila and Little Colorado River Systems; Arizona, Utah and Nevada as to the Virgin River System and Arizona and Utah as to Kanab and Johnson Creeks (Rep. 5).

The Special Master has found that there is no justiciable controversy as to any of these tributaries except the Gila River System (Rep. 321-24). Arizona agrees with this conclusion and none of the parties has excepted to it.

Arizona and New Mexico compromised their dispute regarding the Gila River System and the Master adopted their proposed settlement, embodying its terms in his findings and conclusions and Recommended Decree, over the opposition of the United States (Rep. 324-30, 335-43, 354-58).

The United States has filed no exceptions to the findings and conclusions and Recommended Decree of the Special Master with respect to his disposition of the

[7] Since the Special Master concludes that it is neither necessary nor appropriate to determine at this time the rights of main stream states to tributary inflow, we regard as irrelevant and unnecessary his discussion of the principles which may govern the determination of these rights in the future, should the occasion to do so ever arise, and the remedies which may or may not be available to parties to future litigation, if any, involving the attempted enforcement of these asserted rights (Rep. 317-21). Although we disagree with many of the statements made by the Master in the course of his discussion, we do not set forth the grounds of our disagreement, since we regard the discussion itself as irrelevant.

dispute with regard to rights to use water of the Gila River System. New Mexico has taken no "specific" exception to the Report and Recommended Decree of the Special Master. It has, however, reserved its right to file an answering brief in the event its interests are affected (NM Exc. p. 4).

Arizona has filed exceptions to the Master's finding that in withdrawing lands for the Gila National Forest the United States intended to reserve rights to the use of so much water from the Gila and San Francisco Rivers as might be reasonably needed to fulfill the purposes of the forest and to his conclusion that the United States has the right to divert sufficient water to satisfy such purposes (Rep. 335, 343, 357-58; A Exc. 29, 30).

Therefore, except for questions regarding the Gila National Forest, this brief is limited to the main stream controversy.

The controversy among Arizona, California and Nevada with respect to their rights in main stream water involves factual and legal considerations different in character from and independent of the controversy between Arizona and the United States with respect to the rights of the federal government in main stream water and water from the Gila River System for the Gila National Forest. Therefore, this brief is divided into two parts.

The questions presented immediately hereafter, the statement of facts, the summary of argument and the first three points of Arizona's argument concern the controversy among the states with respect to main stream water and are dealt with in Part I. In Part II of the brief additional questions and further facts relevant to the controversy concerning the rights of the United States are set forth, together with a summary of argument and argument regarding these questions.

PART I

The Controversy Among Arizona, California and Nevada With Respect to Main Stream Water

PART I

The Controversy Among Arizona, California and Nevada With Respect to Main Stream Water

QUESTIONS PRESENTED

1. Whether Congress in enacting the Project Act allocated among Arizona, California and Nevada all available water in Lake Mead and in the main stream of the Colorado River downstream from Lake Mead; and as subsidiary questions:

A. Whether the Project Act renders principles of equitable apportionment inapplicable to the division of main stream water among Arizona, California and Nevada.

B. Whether the Project Act renders inapplicable the doctrine of prior appropriation as to rights to the use of water of the Colorado River, a navigable stream.

C. Whether §6 of the Project Act, in providing that Hoover Dam and Lake Mead should be used for "satisfaction of present perfected rights in pursuance of Article VIII of said Colorado River compact", recognized or confirmed the existence of intrabasin rights in the Lower Basin to the use of water of the Colorado River, or was intended only to satisfy claims of prior rights in the Lower Basin as against the Upper Basin.

D. Whether, assuming §6 of the Project Act protects or confirms any intrabasin water rights in the Lower Basin, a "present perfected right" within the protection of §6 exists only if it was acquired in compliance with the requirements of state law and only to the extent that it represented, at that time, an actual diversion and beneficial use of a specific quantity of water applied to a definite area of land or to a particular domestic or industrial use.

E. Whether, assuming §6 of the Project Act protects or confirms any intrabasin rights in the Lower Basin, it preserves rights perfected as of November 24, 1922, the date that the Compact was signed, or rights perfected as of June 25, 1929, the effective date of the Project Act.

2. Whether the Project Act and the Limitation Act established an irrevocable and unconditional limitation in perpetuity on California's consumptive use of main stream water in an amount not to exceed 4,400,000 acre-feet of the first 7,500,000 acre-feet of such water available for release from Lake Mead in any one calendar year plus one-half of any such water in excess of that amount; and as a subsidiary question:

A. Whether the reference in §4(a) of the Project Act and in the Limitation Act to "the waters apportioned to the lower basin States" by Article III(a) of the Compact means main stream water only or main stream and tributary water.

3. Whether §§4(a) and 5 of the Project Act established a formula which, in the absence of an interstate compact, governs the apportionment of main stream water among Arizona, California and Nevada and to which the water delivery contracts made by the Secretary of the Interior are required to conform; and as a subsidiary question:

A. Whether the provisions of Article 7(b), (d), (f) and (g) of Arizona's water delivery contract, in so far as they do not conform to the formula established by the Project Act, are invalid.

4. Whether the provisions of Article 7(b), (d), (f) and (g) of Arizona's water delivery contract are invalid as contrary to the provisions of §5 of the Project Act,

which requires that "contracts respecting water for irrigation and domestic uses shall be for permanent service", and as introducing tributary considerations into a main stream apportionment.

5. Whether "consumptive use" means diversion from the stream less such return flow thereto as is available for consumptive use in the United States or in satisfaction of the Mexican treaty obligation; and as subsidiary questions:

A. Whether each state's apportionment of water is to be measured at the points of diversion.

B. Whether deliveries in satisfaction of the Mexican treaty obligation and reservoir evaporation, channel and other losses sustained prior to diversion are to be treated as diminution of supply.

C. Whether quantities of water released by the Secretary of the Interior from Lake Mead pursuant to orders therefor but not diverted by the party ordering the same are to be considered as diverted by that party, except to the extent that such quantities of water are delivered to Mexico in satisfaction of the Mexican Treaty or are diverted by others in satisfaction of rights decreed herein.

6. Whether water apportioned to a state which will not be used in that state in any year may be released by the Secretary of the Interior for use in another state if such release would result in deliveries of water for use in a state in excess of the quantities permitted by the Project Act, the Limitation Act or the water delivery contracts.

STATEMENT OF THE CASE

The Colorado River System

The main stream of the Colorado River rises in the mountainous regions of north central Colorado where the highest peaks are over 14,000 feet above sea level. Flowing approximately 1,300 miles, the river is the third longest in the United States, exceeded only by the Mississippi River System and the Rio Grande. The Colorado flows 245 miles through western Colorado and then traverses Utah for 285 miles. After crossing the Utah-Arizona boundary, it proceeds southwesterly through the Grand Canyon for 295 miles and forms the Arizona-Nevada boundary for an additional 145 miles. Flowing almost due south, the river forms the California-Arizona boundary for 235 miles and then becomes the international boundary between Arizona and Mexico for a distance of 16 to 20 miles. It then flows 75 miles within Mexico, emptying into the Gulf of California (Rep. 9).

The Colorado River System drains an area of approximately 242,000 square miles in the United States and its basin is comprised of portions of Wyoming, Colorado, Utah, New Mexico, Arizona, Nevada and California, or one-twelfth of the continental United States exclusive of Alaska. The drainage basin from its northernmost point in Wyoming to the Mexican border is approximately 900 miles long and varies in width from about 300 miles in the northerly section to about 500 miles in the southerly section. It is bounded on the north and east by the Continental Divide in the Rocky Mountains, on the west by the Wasatch Range and other divides and by minor divides on the south and southwest (Rep. 9).

Significantly, 107,242 square miles, or more than 94% of the total area of Arizona, are within the drainage basin

of the river and conversely over 44% of the drainage basin lies within Arizona. Also, 100,306 square miles, or 88.5% of the state's total area, are within the drainage area of the Lower Basin of the river and 75.8% of the Lower Basin drainage area of the river is within Arizona (Rep. 10).

In contrast, only 3,599 square miles, or 2.3% of California's total area, are within the drainage basin of the Colorado River and only 1.5% of the drainage basin lies within California. This comparatively small area of the state is in the Lower Basin drainage area of the river and merely 2.7% of the Lower Basin drainage area is within the State of California (Rep. 10).

A canyon approximately 1,000 miles long in southern Utah and northern Arizona divides the basin of the Colorado River System into two natural parts, which are known and will be referred to as the Upper Basin and Lower Basin, respectively (Rep. 11). In both basins most kinds of agriculture can be practiced successfully only by irrigation because of prevailing arid and semi-arid conditions (Rep. 13). The important geographic and climatic differences between the two basins and their particular significance to this case will appear in the course of this brief.

Above the canyon section the basin is at high elevations and the growing season for crops is short, while below the canyon section the irrigable portions of the basin lie at low elevations and the growing season for crops is long, continuing in many places throughout the year. As a result, the extreme aridity and the long growing season of the Lower Basin make its water consumption per irrigated acre relatively high. Losses by evaporation and transpiration are much greater in the lower part of the river system than in the upper (Rep. 12-14).

Systems tributary to the Colorado exist in every basin state except California. The most important of these in the Lower Basin are the Little Colorado in Arizona and New Mexico, the Bill Williams in Arizona, the Gila in Arizona and New Mexico and the Virgin in Nevada, Utah and Arizona (Rep. 11).

The confluence of the Gila with the Colorado occurs between Laguna Dam and Yuma, Arizona, south of all existing diversion structures in the United States. No water emptying from the Gila into the Colorado is diverted or used in California (Rep. 179 note 38; A 114).

The Compact

For many years before 1922, when the Compact was negotiated, the flow of the Colorado River was unpredictable and erratic. Floods menaced and seriously damaged the Lower Basin, particularly in the Yuma area and Imperial Valley. Flood control by storage was essential to protect the Lower Basin (Rep. 20).

Since the water supply from the main stream in the Lower Basin was variant and undependable for irrigation, there was immediate need for storage in the Lower Basin to control the flow of the river in order to assure a regulated water supply. Moreover, the Colorado River carried large amounts of silt which damaged irrigation works and agricultural lands, thus making silt control essential to the protection and development of the Lower Basin (Rep. 20-21).

Water for the Imperial Valley was supplied by a Mexican corporation through the Alamo Canal, which, for the greater part of its length, was located in Mexico. The canal was maintained by the Mexican corporation under a concession granted to it in 1904 by the Republic of Mexico, and the concession required that there be made available for irrigation in Mexico an amount not "exceeding

one-half of the volume of water passing through said canals" (C 137). The Mexican corporation was formed by the developers of Imperial Valley to comply with Mexican law. After the organization of Imperial Irrigation District, its directors became directors of the Mexican corporation. A canal wholly within the United States to provide water for Imperial Valley was recognized as essential to eliminate complications arising from the location of the Alamo Canal in Mexico and from the Mexican concession and to remove the Imperial Valley water supply from Mexican control (Rep. 20).

The demand by the Lower Basin for the construction of storage facilities on the main stream of the Colorado River for its benefit caused apprehension in the Upper Basin states of Colorado, New Mexico, Utah and Wyoming. They recognized that agricultural expansion and other developments in the Upper Basin would be much slower than in the Lower. Because of this, they feared that construction of storage facilities on the main stream of the Colorado River for the benefit of the Lower Basin would permit uses of water there to expand rapidly and form the basis for possible claims of prior appropriative rights, which would prevent long-range development in the Upper Basin (Rep. 22).

Necessity for adjustment of this conflict of interest had been recognized long before 1922. On May 18, 1920, Congress passed the Kincaid Act authorizing and directing the Secretary of the Interior to investigate and report as to the feasibility and advisability of a plan of irrigation development in the Imperial Valley in the State of California. On November 27, 1920, the Director of the Reclamation Service, pursuant to this direction of Congress, transmitted a report on the problems of the Lower Basin to the Secretary of the Interior.

In early 1921, the seven Colorado River Basin states by legislation authorized the appointment of commissioners to negotiate a compact for apportionment of the water supply of the river and its tributaries. Later that year Congress consented that the states might negotiate and conclude a compact which would equitably apportion the water of the Colorado River and its tributaries among the states, on condition that a representative of the United States be appointed by the President to participate in the negotiations and report to Congress on the proceedings and any compact which might result (Rep. 22-24).

The Colorado River Commission, consisting of members appointed by the seven Colorado River Basin states and Mr. Herbert Hoover, representative of the United States, convened on January 26, 1922 (Rep. 24).

On November 24, 1922, an interstate agreement, known as the Colorado River Compact, was executed (Rep. 24).

The Compact represents an accommodation of the conflicting interests of the Upper and Lower Basins for the mutual benefit of both (Rep. 139).

State Action on the Compact

In 1923, the legislatures of the Colorado River Basin states, except Arizona, approved the Compact (Rep. 24).

In 1925, these six states waived the requirement that seven states ratify the Compact and agreed that it should become effective whenever six of the signatory states and Congress should ratify it (Rep. 24-25).

Unsuccessful Federal Legislation, 1922-1927

Between 1922 and 1927, three bills popularly known as the Swing-Johnson bills were successively introduced by Representative Swing and Senator Johnson, both of

California, which would have authorized construction of an All-American canal and a dam at or near Boulder Canyon, but all failed of enactment (Rep. 27).

Unsuccessful Attempts to Make a Lower Basin Compact

From 1925 to 1927, negotiations between Arizona, California and Nevada for a Lower Basin compact dividing among them the water apportioned to the Lower Basin by the Compact were unsuccessful.[8]

The Governors' Conference of 1927

In 1927, the Governors of the seven Colorado River Basin states met to attempt to bring about seven-state ratification of the Compact. The Governors of the Upper Division states suggested by resolution adopted by them at this conference that, out of the average annual delivery of water to be provided by those states at Lee Ferry under the Compact, there be apportioned to Nevada 300,000 acre-feet, to Arizona 3,000,000 acre-feet and to California 4,200,000 acre-feet. They further recommended that each Lower Basin state should have exclusive use of all water of Colorado River tributaries within its boundaries above the place where that water emptied into the main stream. These proposals failed of acceptance primarily because of California's demand that it should be allotted 4,600,000 acre-feet and Arizona's insistence that California be limited to 4,200,000 acre-feet.[9]

[9] 70 Cong. Rec. 172 (1928), Ariz. Legis. Hist. 50-52; 69 Cong. Rec. 10259 (1928), Ariz. Legis. Hist. 22-23.

The Project Act

The fourth Swing-Johnson bill,[10] authorizing construction of the All-American Canal and of a dam at or near Boulder Canyon, was introduced in December 1927, passed by the House with amendments and sent to the Senate in May 1928. Senate action in the first session of the Seventieth Congress was prevented by an Arizona-led filibuster. In December 1928, the Senate resumed consideration of the bill, which it passed after extended debate and amendment. Thereafter the bill was adopted by the House without further amendment. It was approved by the President on December 21, 1928, and by its terms was to be known as the "Boulder Canyon Project Act".

Congress in enacting the Project Act authorized construction of a dam in the main stream of the Colorado River at Black Canyon or Boulder Canyon (Hoover Dam) adequate to create a storage reservoir (Lake Mead) with a capacity of at least 20,000,000 acre-feet and construction of the All-American Canal from the Colorado River to Imperial and Coachella Valleys in California (§1, Appendix B, pp. 9a-10a).

The Project Act also approved the Compact (§13(a), Appendix B, pp. 23a-24a).

The Project Act was not to take effect until certain specified conditions precedent had been met: (1) ratification of the Compact by the seven Colorado River Basin states within six months from the date of the passage of the Act or, if seven states failed to ratify within the six-month period, (2) ratification by six of those states, including California, a waiver by each ratifying state of the Compact requirement of seven-state ratification and enactment by the California legislature of the Limitation Act (§4(a), Appendix B, pp. 12a-13a).

[10] H.R. 5773 and S. 728, 70th Cong., 1st Sess. (1927).

The Limitation Act

The Compact was not ratified by the seven Colorado River Basin states within six months after passage of the Project Act, although six states, including California, ratified within that time and waived seven-state ratification (Rep. 25-26, 166).

On March 4, 1929, the California legislature enacted the Limitation Act which, in compliance with the conditions prescribed by the Project Act for its effectiveness, accepted the limitations imposed therein upon the use in California of water "of and from the Colorado River" (Rep. 26, 180-82; Appendix C, pp. 27a-28a).

Presidential Proclamation

On June 25, 1929, the President proclaimed the Project Act to be effective. His proclamation declared that (a) there had not been seven-state ratification of the Compact within six months of passage and approval of the Project Act; (b) there had been six-state ratification of the Compact and waiver by the ratifying states of the requirement of seven-state ratification; (c) the requirements of §4(a) of the Project Act necessary to render the Act effective had been met by California and (d) all prescribed conditions for effectiveness of the Project Act had been fulfilled (Rep. 26-27).

Construction of Hoover and Imperial Dams and the All-American Canal

Pursuant to authorization of the Project Act, Hoover Dam was constructed in Black Canyon in the main channel of the Colorado River 330 miles above the Mexico-California border. The middle of the channel at the site is the boundary between Nevada and Arizona. Construction was initiated September 17, 1930, water first impounded February

1, 1935 and power first generated September 11, 1936. The dam is the principal structure of the Lower Basin development, impounding the water of the Colorado River to create a huge reservoir called Lake Mead, which has a maximum length of 115 miles and a maximum width of 8 miles. The original unsilted storage capacity of Lake Mead was 32,359,000 acre-feet and its maximum surface area is 162,700 acres. Its present usable capacity is approximately 27,200,000 acre-feet. Title to Hoover Dam is in the United States and it is operated and maintained by the Department of the Interior (Rep. 32-33).

Also pursuant to authority of the Project Act, Imperial Dam was built in the main channel of the Colorado River 303 miles below Hoover Dam and 18 miles above Yuma, Arizona. The thread of the stream at the dam site constitutes the boundary between Arizona and California. Imperial Dam is the diversion point for the All-American Canal and for the Gila Project and the Yuma Auxiliary Project in Arizona. Title to the dam is in the United States and it is operated and maintained by the Department of the Interior (Rep. 35-36).

The All-American Canal was built under authority of the Project Act primarily to carry Colorado River water from Imperial Dam to the Imperial and Coachella Valleys in California (Rep. 36-37).

Regulations of the Secretary of the Interior Governing Water Contracts

After the Project Act became effective, the Secretary of the Interior in 1930 promulgated general regulations under which the United States would contract for storage and delivery of main stream Colorado River water. These regulations required contracts for domestic and irrigation uses to be for permanent service and to conform to §4(a)

of the Project Act and that all contracts for delivery of water be subject to the terms and conditions of the Compact and Project Act (Appendix D, pp. 29a-33a).

The California Contracts and Seven-Party Agreement

From time to time the Secretary of the Interior entered into contracts on behalf of the United States with the California defendants for delivery of an aggregate of 5,362,000 acre-feet of water annually from Lake Mead, subject to the availability of such water under the Compact and the Project Act (Rep. 207-08; see, *e. g.*, Appendix H, pp. 59a-70a).

By agreement of August 18, 1931 (the Seven-Party Agreement, which is incorporated in all the California contracts, see, *e. g.*, Appendix H, pp. 59a-70a), the various California agencies established intrastate priorities to the use of Colorado River water as follows:

1. A first priority to Palo Verde Irrigation District for water for 104,500 acres.

2. A second priority to the Yuma Project in California for water for 25,000 acres.

3. A third priority to Imperial Irrigation District, Coachella Valley and Palo Verde Irrigation District for 3,850,000 acre-feet less the quantities under the first and second priorities.

4. A fourth priority to Metropolitan Water District for 550,000 acre-feet.

5. A fifth priority to Metropolitan Water District for 550,000 acre-feet and to San Diego for 112,000 acre-feet.

6. A sixth priority to Imperial and Coachella Valleys and to the Palo Verde Irrigation District for 300,000 acre-feet.

7. A seventh priority for agricultural use for all water remaining for use in California.

The Special Master has held that "the 5,362,000 acre-feet for which California users have contracted must be satisfied as follows: 4,400,000 acre-feet out of the first 7,500,000 acre-feet; and 962,000 acre-feet out of surplus" (Rep. 224 note 85).

The Nevada Contracts

By contracts dated March 30, 1942, and January 3, 1944, respectively, the United States agreed to deliver annually to Nevada from Lake Mead so much water, including all other waters diverted for use within Nevada from the Colorado River System, as might be necessary to supply the state with a total quantity of not to exceed 300,000 acre-feet per annum, subject to the availability of such water under the Compact and the Project Act (Rep. 28, 209-10; Appendices, F, G, pp. 45a-58a).

Arizona's Ratification of the Compact

On February 24, 1944, Arizona unconditionally ratified the Compact by Act of its legislature, effective as of that date (Rep. 27).

The Arizona Contract

By contract dated February 9, 1944, effective February 24, 1944, the United States agreed to deliver annually to Arizona and its water users from storage in Lake Mead so

much water as might be necessary for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet plus one-half of the surplus water unapportioned by the Compact, subject to the availability of such water under the Compact and the Project Act (Rep. 29, 205-06).

Article 7(b) of the Arizona contract (Appendix E, p. 37a) provides in part that deliveries to Arizona of unapportioned water shall be "less such excess or surplus water unapportioned by said compact as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said states as stated in subdivisions (f) and (g) of this Article". In subdivision (f) (Appendix E, p. 38a) Arizona "recognizes the right" of the United States and Nevada to contract for annual beneficial consumptive use within Nevada for agricultural and domestic uses of one-twenty-fifth "of any excess or surplus waters available in the Lower Basin and unapportioned by the Colorado River Compact . . . ." By subdivision (g) (Appendix E, p. 38a) Arizona "recognizes the rights of New Mexico and Utah to equitable shares of the water apportioned by the Colorado River Compact to the Lower Basin and also water unapportioned by such compact . . . ."

The Arizona contract further provides in Article 7:

> "(d) The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead . . . ."

Circumstances Requiring Adjudication of Arizona's Rights

Since Arizona is an arid state, irrigation is essential to its successful agriculture and water is needed for domestic, municipal and industrial purposes. The state has no

substantial surface water supply except from the Colorado River System (A 1000, pp. 7-8).

In the central part of Arizona, consisting primarily of Maricopa and Pinal Counties, the water supply is inadequate to meet existing demands and maintain present economic development (A 64, p. 11; A 136). Since 1940, there has been rapid and continuous lowering of the groundwater table in central Arizona (A 145, 159, 391, 392) and as a result wells in some areas have gone completely dry, while in others further pumping has become economically impractical. In prospect these conditions will grow progressively worse (Tr. 1458, 1539-41, 1641, 1660, 2010, 2012-14).

There has been an alarming decrease in acreage under cultivation in central Arizona. In 1952, agricultural lands irrigated in Maricopa and Pinal Counties aggregated 875,500 acres. By 1955, this total had declined by more than 100,000 acres (A 136, Tables for 1952 and 1955) and, unless a supplemental water supply is provided, the maximum of irrigated lands which can be permanently maintained in these two counties is between 450,000 and 500,000 acres (Tr. 1476-83).

The main stream of the Colorado River is the only available source of water to supplement the local water supply in central Arizona (A 65, p. 3, par. 15; A 71, p. 115, par. 15).

In 1944, the United States Bureau of Reclamation in cooperation with Arizona began active investigation and planning of what is known as the Central Arizona Project, designed to bring supplemental water from the main stream of the Colorado River to a portion of the central Arizona area suffering from an inadequate water supply (Rep. 30). On September 16, 1948, the Secretary of the Interior

reported to Congress that this project was feasible and that there was urgent need in central Arizona for water from the Colorado River, which the project would make available (Rep. 30; A 70). The Secretary also reported that California challenged Arizona's claims to the water which the Central Arizona Project would divert and that if California's contentions were correct there would be no dependable water supply available from the Colorado River for diversion to central Arizona (Rep. 30, 130).

During the Seventy-Ninth and succeeding Congresses through the Eighty-Second Congress, Arizona sought congressional authorization for construction of the Central Arizona Project and met with vigorous resistance by the California defendants, who claimed Arizona had not shown there was any water of the Colorado River System available for use in Arizona in addition to that in use or required for Arizona projects already authorized (Rep. 31, 130).

The Senate approved this legislation in the Eighty-First and Eighty-Second Congresses. However, on April 18, 1951, the House of Representatives Committee on Interior and Insular Affairs adopted a resolution that consideration of bills relating to the Central Arizona Project "be postponed until such time as use of the water in the Lower Colorado River Basin is either adjudicated or binding or mutual agreement as to the use of the water is reached by the states of the Lower Colorado River Basin" (Rep. 31, 131).

In 1952, Arizona made a motion for leave to file its Bill of Complaint, which was granted on January 19, 1953 (344 U. S. 919), and the Bill of Complaint was filed that day (Rep. 1, 31, 131).

SUMMARY OF THE ARGUMENT

I. The Water Dealt With by the Project Act and the Limitation Act

Neither construction of Hoover Dam nor the vast benefits resulting from its operation, which have been and will continue to be enjoyed by the parties to this action, could have been realized without the authorization of Congress. That authorization was given in the Project Act by Congress in the exercise of its plenary power over navigable waters.

The Project Act did not become effective, however, until certain conditions precedent, explicitly set forth in §4(a) of the statute itself, had been fulfilled. These conditions were: (A) ratification of the Compact within six months after June 25, 1929, the effective date of the Act, by all seven Colorado River Basin states; (B) failing such seven-state ratification (a) approval of the Compact by six states, including California, and their waiver of the Compact requirement that seven states ratify; (b) enactment by California of the Limitation Act and (c) presidential proclamation of the effectiveness of the Project Act.

Seven-state ratification of the Compact within the prescribed six-month period did not occur. But the alternative conditions laid down by Congress for effectiveness of the Project Act were met in every respect (Rep. 26-27).

In specifying the conditions for effectiveness of the Project Act, Congress required that California should

> " . . . agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this Act, that the aggre-

> gate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact." Project Act §4(a)

California complied with this condition by enactment of the Limitation Act which, in terms practically identical with those of the Project Act, provided that

> " . . . the State of California as of the date of such proclamation agrees irrevocably and unconditionally with the United States and for the benefit of the states of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming as an express covenant and in consideration of the passage of the said 'Boulder canyon project act' that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado river for use in the State of California including all uses under contracts made under the provisions of said 'Boulder canyon project act,' and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin states by paragraph 'a' of article three of the said Colorado river compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact." Limitation Act §1

The Special Master concluded that the provisions, general operative scheme and legislative history of the Project Act establish that both §4(a) of the Project Act and the Limitation Act refer only to water in Lake Mead and flowing in the main stream below Hoover Dam (Rep. 138, 151-52, 173-83). Therefore, he found that the phrase, "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact", was intended by Congress to refer only to water in the main stream, and not to water of tributaries. Hence, when Congress thus made reference to the 7.5 million acre-feet per annum apportioned to the Lower Basin by Article III(a) of the Compact, Congress was dealing with main stream water only, *i.e.*, water in Lake Mead and in the main stream below Hoover Dam; and consequently, by virtue of §4(a) of the Project Act and the Limitation Act, California is limited to 4.4 million acre-feet of that water (Rep. 173 *et seq.*).

In addition, the Special Master concluded that Congress considered the limitation on California to be part of an overall allocation of the entire quantity of water dealt with in §4(a) among three states only: of the first 7.5 million acre-feet available in each year, 4.4 to California, 2.8 to Arizona and .3 to Nevada and the balance in excess of 7.5 million acre-feet to California and Arizona equally (Rep. 174).

Arizona agrees with these conclusions of the Special Master and urges their adoption by the Court.

The Master reached these results solely on the basis of the terms, purposes and legislative history of the Project Act. He considered, and we agree, that the Compact has utility as a decisive factor in this case only insofar as it serves to determine the supply of main stream water legally available in the Lower Basin and that the Compact

is not relevant to the allocation of water from Lake Mead and from the main stream of the river below Hoover Dam among Arizona, California and Nevada (Rep. 138-41).

It makes little difference, therefore, whether the apportionment provisions of Article III(a) of the Compact refer to main stream water only, as Arizona contends (A Exc. 3), or whether those provisions cover both main stream and tributary water, as the Master construes them (Rep. 173). Whatever may be the correct interpretation of Article III(a), considered independently and apart from the Project Act, it is the construction put upon Article III(a) by Congress in enacting the Project Act, which made the Compact effective, and that construction alone, which is controlling.

As the Special Master has found, the evidence is clear that Congress, in enacting §4(a), intended to provide for the apportionment of main stream water exclusively—not water ~~of tributaries~~ as well (Rep. 173 *et seq.*).

By referring in §4(a) to provisions of Article III(a) of the Compact, either Congress construed those provisions as dealing with main stream water only, or, if it regarded them as including tributaries, it in effect modified the terms of the Compact referred to by limiting their application to main stream water.

In either event, the effect of §4(a) and the Limitation Act is to restrict California to the annual consumptive use of 4.4 million acre-feet of water from the main stream of the Colorado River plus one-half the excess or surplus above the first 7.5 million acre-feet of such water available in any one year for use in the Lower Basin.

II. The Statutory Apportionment

Section 4(a) of the Project Act, in addition to requiring limitations on California's use of main stream water as a

condition precedent to its effectiveness, authorized Arizona, California and Nevada to enter into an agreement which should provide, among other things:

> "(1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact. . . ."

No such interstate compact has been made.

Section 5 of the Project Act, after authorizing the Secretary of the Interior to contract for the storage and delivery of water in Lake Mead, provides:

> "Contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to paragraph (a) of section 4 of this Act. No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated."

Section 8(b) authorized Arizona, California and Nevada, or any two of them, to provide by compact for an equitable division of Colorado River water on different terms from those suggested by Congress in §4(a), subject to congressional approval and consent, but provided that any such compact should be subordinate to the Secretary's water delivery contracts made prior to congressional approval of the compact (Appendix B, p. 20a).

The Special Master has found that by these provisions Congress authorized the Secretary of the Interior to enter

into water delivery contracts which, in the absence of an interstate compact, would control the allocation of main stream water among Arizona, California and Nevada (Rep. 99-100, 152-54, 201). But the Master has rejected Arizona's contention that §4(a) establishes a mandatory formula of water allocation which the Secretary is required "precisely to follow" in his water delivery contracts (Rep. 162-63).

Arizona adheres to her position before the Special Master and urges its adoption by the Court (A Exc. 7, 8). It is Arizona's contention that all contracts made by the Secretary pursuant to the authority granted him by §5 of the Project Act must conform to the formula for the allocation of water established by §4(a). The formula of water allocation established by §§4(a) and 5 does not leave to the Secretary's discretion the determination of the quantity of water to be delivered within each state pursuant to contract. The statute fixed a formula for the apportionment of water stored in Lake Mead among the states of Arizona, California and Nevada and this formula is mandatory upon the Secretary and controls his water delivery contracts.

As a corollary, it follows that Arizona's existing water delivery contract, insofar as it does not conform to the formula established by the Project Act, is beyond the contractual competence of the contracting parties, exceeds the authority of the Secretary and is without legal effect (A Exc. 7).

Furthermore, the provisions of Article 7(b), (d), (f) and (g) of Arizona's water delivery contract are invalid because they are contrary to the provision of §5 of the Project Act, which requires that "contracts respecting water for irrigation and domestic uses shall be for permanent service", and because they introduce tributary considerations into a main stream apportionment (A Exc. 8).

III. Appropriative and "Perfected Rights"

The Project and Limitation Acts and the Secretary's water delivery contracts made pursuant thereto complete the "statutory apportionment" among Arizona, California and Nevada of main stream water in Lake Mead and downstream from Lake Mead (Rep. 100, 138, 152). Arizona agrees with the Special Master's holding that "this case involves a statutory, not an equitable, apportionment" of water (Rep. 100) and that "the doctrine of equitable apportionment, and the law of appropriation are . . . irrelevant to the allocation of such water among the three states." (Rep. 138; see Rep. 152).

Congress, by virtue of the structures erected under authority of the Project Act, has impounded substantially all the water of the main stream of the Colorado River (Rep. 153). Congress has done this in the exercise of its dominion and plenary power over navigable waters of the United States.

Assuming that appropriative rights in the use of the water of the Colorado River had vested before the Project Act, the enactment of the statute divested them in the absence of a congressional intention that they be recognized and preserved.

The Special Master has found that §6 of the Project Act (Appendix B, pp. 18a-19a) was intended to protect water rights in the main stream of the Colorado River within the Lower Basin states "perfected" as of June 25, 1929 (the effective date of the Act), against possible shortages in the water apportioned to the Lower Basin by the Compact (Rep. 234, 308-13).

Arizona disagrees (A Exc. 5, 6). The clause in §6—"satisfaction of present perfected rights in pursuance of

Article VIII of said Colorado River compact''—was intended to comply with the provisions of Article VIII, which discharged the Upper Basin from claims of "rights, *if any,* by appropriators or users of water in the Lower Basin against appropriators or users of water in the Upper Basin''[11], after storage capacity of 5,000,000 acre-feet had been provided in the main Colorado River within or for the benefit of the Lower Basin. In short, Article VIII provides for satisfaction of perfected rights only basin versus basin and makes no provision for satisfaction of intrabasin rights. Congress intended in §6 of the Project Act to meet the requirements of Article VIII of the Compact for the protection of the Upper Basin, and nothing more.

Assuming, however, that the Master's construction of §6 is correct, Arizona agrees with his conclusion that the protection there provided covers only rights acquired in compliance with state law and is effective only to the extent that such rights represent actual diversions and beneficial use of specific quantities of water applied to defined areas of land or to particular domestic or industrial uses (Rep. 308).

Further, it is Arizona's position that the term "present perfected rights'' refers only to those rights which were perfected as of November 24, 1922, the date the Compact was signed, and not as of June 25, 1929, the effective date of the Project Act. Arizona asserts that the Compact speaks as of the date it was signed rather than as of the date it was confirmed and approved (A Exc. 6).

ARGUMENT

I

Congress in enacting the Project Act exercised its plenary power over navigable water and allocated among Arizona, California and Nevada all available water in Lake Mead and in the main stream of the Colorado River downstream from Lake Mead. Therefore, principles of equitable apportionment and priority of appropriation are not applicable to the division of main stream water among those states.

A. The Constitutional Power of Congress Over Navigable Waters

The power of Congress over navigable waters is so complete and absolute as to amount to "dominion". As this Court stated in its most recent pronouncement upon the subject:

> "It is no longer open to question that the Federal Government under the Commerce Clause of the Constitution (Art. 1, §8, cl. 3) has dominion, to the exclusion of the States, over navigable waters of the United States."

Tacoma v. *Taxpayers of Tacoma,* 357 U. S. 320, 334 (1958). See also *United States* v. *Willow River Power Co.,* 324 U. S. 499 (1945); *United States* v. *Appalachian Electric Power Co.,* 311 U. S. 377, 423-24 (1940); *United States* v. *Chandler-Dunbar Water Power Co.,* 229 U. S. 53 (1913); *United States* v. *Rio Grande Dam & Irrigation Co.,* 174 U. S. 690 (1899); *Gibson* v. *United States,* 166 U. S. 269 (1897).

The plenary power of Congress over navigable waters was analyzed by Justice Douglas in *United States* v. *Twin City Power Co.*, 350 U. S. 222, 224-25 (1956):

> "The interest of the United States in the flow of a navigable stream originates in the Commerce Clause. That Clause speaks in terms of power, not of property. But the power is a dominant one which can be asserted to the exclusion of any competing or conflicting one. The power is a privilege which we have called 'a dominant servitude' (see *United States* v. *Commodore Park, Inc.*, 324 U. S. 386, 391; *Federal Power Commission* v. *Niagara Mohawk Power Corp.*, 347 U. S. 239, 249) or 'a superior navigation easement'. *United States* v. *Gerlach Live Stock Co.*, 339 U. S. 725, 736. The legislative history and the construction of particular enactments may lead to the conclusion that Congress exercised less than its constitutional power, fell short of appropriating the flow of the river to the public domain, and provided that private rights existing under state law should be compensable or otherwise recognized. Such were *United States* v. *Gerlach Live Stock Co.*, *supra*, and *Federal Power Commission* v. *Niagara Mohawk Power Corp.*, *supra*. We have a different situation here, one where the United States displaces all competing interests and appropriates the entire flow of the river for the declared public purpose."

The Court has held time and again that "the flow of a navigable stream is in no sense private property"; that therefore the United States could take over a power project on a navigable river privately operated under state license, *United States* v. *Appalachian Electric Power Co.*, 311 U. S. 377, 424 (1940); and that Congress may decide conclusively, as a purely legislative question, whether the entire flow of a navigable stream should be conserved for

the use and safety of navigation, *United States* v. *Chandler-Dunbar Water Power Co.*, 229 U. S. 53 (1913).

Considering the conflict between so-called water "rights" of riparian owners on the one hand and operations of the federal government in aid of navigation on the other, the Court stated in *United States* v. *Willow River Power Co.*, 324 U. S. 499, 510 (1945):

> "Rights, property or otherwise, which are absolute against all the world are certainly rare, and water rights are not among them. Whatever rights may be as between equals such as riparian owners, they are not the measure of riparian rights on a navigable stream relative to the function of the Government in improving navigation. Where these interests conflict they are not to be reconciled as between equals, but the private interest must give way to a superior right, or perhaps it would be more accurate to say that as against the Government such private interest is not a right at all."

In summary, as against the power of the United States under the Commerce Clause, there are no private property rights in the waters of a navigable stream. This is true whether the asserted "rights" are claimed to be riparian or appropriative in character. See *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 690 (1899); *Gibson* v. *United States*, 166 U. S. 269 (1897).

All rights to the use of water of navigable streams, whether claimed by sovereign states or private users, are subservient to the plenary power and dominion of the United States under the Commerce Clause. Congress in the exercise of this power and dominion may abolish, limit or preserve, as it deems fit, pre-existing rights to the use of navigable water. In any case, when such claims of right are affected by the exercise of this federal control,

the question as to the extent of the effect upon them is not a question of power but one of congressional intent.

Therefore, in the case at bar, assuming the existence of appropriative or riparian rights in the main stream of the Colorado River prior to enactment of the Project Act, reference must be made to the terms, purposes and legislative history of the statute in order to determine its effect on those asserted rights.

B. Provisions of the Project Act

In the enactment of the Project Act, Congress realized that the dam authorized by the Act would impound substantially all the water in the main stream of the river at the dam site and that the water impounded would be stored in Lake Mead (Rep. 153). The situation here is akin to that in *United States* v. *Twin City Power Co.*, 350 U. S. 222, 225 (1956)—"one where the United States displaces all competing interests and appropriates the entire flow of the river for the declared public purpose."

The public purposes to be served by the authorized dam and reservoir are clearly set forth in the Project Act. Exercising its plenary power over the river, a navigable stream, Congress authorized the Secretary of the Interior

> "to construct, operate, and maintain a dam and incidental works in the main stream of the Colorado River at Black Canyon or Boulder Canyon adequate to create a storage reservoir of a capacity of not less than twenty-million acre-feet of water"

for

> "the purpose of controlling the floods, improving navigation and regulating the flow of the Colorado River, providing for storage and for the delivery of the stored waters thereof for reclamation of public lands and other beneficial uses exclusively within the

> United States, and for the generation of electrical energy. . . ." Project Act §1

Congress directed that the dam and reservoir should be used:

> "First, for river regulation, improvement of navigation and flood control; second, for irrigation and domestic uses . . . and third for power." Project Act §6

It provided that title to the dam, reservoir, plant and incidental works should forever remain in the United States and that the United States should, until otherwise provided by Congress, control, manage and operate them (§6, Appendix B, pp. 18a-19a).

Congress further provided that the water thus impounded and stored should be placed under the control of the Secretary of the Interior, subject to specific limitations on his authority prescribed by the Project Act. As sole administrator of the statute and operator of the dam and reservoir, the Secretary is empowered to retain or to release the impounded and stored water so as to achieve the enumerated purposes of the statute in the order of their priority. He can release water from Lake Mead for irrigation and domestic purposes, but only after the superior needs of navigation, flood control and river regulation have been served.

The Special Master has concluded that the Project Act is the source of authority for the allocation and delivery of water to Arizona, California and Nevada from Lake Mead and from the Colorado River below Lake Mead (Rep. 151).

Section 5 authorizes the Secretary "under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof

at such points on the river . . . as may be agreed upon, for irrigation and domestic uses . . . ." To make its intention abundantly clear, Congress declared in §5 that: "No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract as herein stated." Section 5 also provides that: "Contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to paragraph (a) of section 4 of this Act." The intention to exert authority over the allocation and distribution of water stored in Lake Mead is likewise manifested in §8(b) of the Act. That section contemplates that Arizona, California and Nevada, or any two of them, may negotiate a compact for a division of Colorado River water but provides that this compact shall be subject to water delivery contracts made by the Secretary of the Interior prior to congressional approval of the compact (Rep. 151).

We agree with the Special Master that the terms of the Project Act, together with the general operational scheme established in the Act and the purposes of the Act explicated in the legislative history

> "make it clear that the Project Act was designed by Congress to establish the authority for an allocation of all of the available water in Lake Mead and in the mainstream of the Colorado River downstream from Lake Mead among Arizona, California and Nevada. . . . As to this water, principles such as equitable apportionment or priority of appropriation which might otherwise have controlled the interstate division of the River in its natural flow condition were rendered inapplicable by the Project Act." (Rep. 152) (footnote omitted)

Whether the Project Act is viewed as itself laying down a formula for the division of main stream water

among Arizona, California and Nevada to which the Secretary is required precisely to conform in his water delivery contracts, as Arizona contends (see pp. 83-99, *infra;* A Exc. 7, 8), or is construed as conferring upon the Secretary certain discretionary powers in the division of such water, as the Special Master holds (Rep. 161-63), in either event the Project Act is the source of authority for the division of main stream water and there is no occasion for the application of principles of equitable apportionment.

C. Legislative History

That Congress intended to provide in the Project Act for the allocation of stored water among Arizona, California and Nevada is demonstrated by the legislative history of the Act. Indeed, as the Special Master concluded:

> "The congressional debates are almost unintelligible except on the premise that the legislators considered that they were providing, in the Project Act itself, the authority for the allocation of impounded water among the states." (Rep. 154)

Senator Pittman of Nevada clearly considered that an apportionment was being made by the provisions of the Project Act. Discussing the Phipps amendment, he stated:

> "The Senate has already determined upon the division of water between those States. How? It has been determined how much water California may use, and the rest of it is subject to use by Nevada and Arizona. Nevada has already admitted that it can use only . . . 300,000 acre-feet. That leaves the rest of it to Arizona. As the bill now stands it is just as much divided as if they had mentioned Arizona and Nevada and the amounts they are to get. . . ."[12]

[12] 70 Cong. Rec. 468 (1928), Ariz. Legis. Hist. 123.

Since California would be limited to 4.4 million acre-feet of the 7.5 million dealt with by §4(a), and Nevada could use only 300,000 acre-feet, the remainder of 2.8 million was to go to Arizona, and the Senate so understood. Thus Senator Pittman concluded:

> ". . . Arizona to-day has practically allocated to it 2,800,000 acre-feet of water in the main Colorado River."[13]

Although, as we have seen, Congress suggested in §4(a) what it considered to be an equitable allocation of stored water which might be accomplished by an interstate compact among Arizona, California and Nevada, it had no intention of leaving the water in storage unallocated among these states should they fail to agree. The patience of Congress had been worn thin by the protracted controversy among the Lower Basin states over the water of the Colorado River. As Senator Pittman reminded the Senate:

> "Mr. President, this question has been here now for seven years. The seven States have been attempting to reach an agreement. Apparently the Senate of the United States is about to reach an agreement as to what ought to be done. The Senate has already stated exactly what it thinks about the water. That might have been an imposition on some States. Why do we not leave it to California to say how much water she shall take out of the river or leave it to Arizona to say how much water she shall take out of the river? It is because it happens to become a duty of the United States Senate to settle this matter, and that is the reason."[14]

Senator Hayden of Arizona, who like Senator Pittman, was one of the architects of the Project Act, emphasized a

[13] 70 Cong. Rec. 469 (1928), Ariz. Legis. Hist. 126.

[14] 70 Cong. Rec. 471 (1928), Ariz. Legis. Hist. 130.

number of times that the bill provided for the apportionment of water among Arizona, California and Nevada regardless of interstate priorities, but that it would not affect intrastate water rights. Senator Hayden stated:

> "The only thing required in this bill is contained in the amendment that I have offered, that there shall be apportioned to each State its share of the water. Then, who shall obtain that water in relative order of priority may be determined by the State courts."[15]

The amendment referred to by Senator Hayden was eventually enacted with certain modifications as the second paragraph of §4(a) of the Project Act.

The Congressional Record is replete with many instances of a recognition and realization by the Senate that the statute under consideration, if enacted, would be the authority for the division of water among the three states involved (pertinent excerpts are set forth at pp. 58-67, 90-99, *infra*).

On the basis of its language and legislative history the Master concluded that the Project Act is "the source of authority for the allocation and delivery of water to Arizona, California and Nevada from Lake Mead and from the Colorado River below Lake Mead" (Rep. 151). This conclusion is wholly justified and indeed inescapable.

D. Inapplicability of Principles of Equitable Apportionment

Finding that Congress intended the Project Act to be the source of authority for the division of main stream water among the three Lower Basin states, the Master held that the doctrine of equitable apportionment and the law of prior appropriation are irrelevant to the allocation of such

---

[15] 70 Cong. Rec. 169 (1928), Ariz. Legis. Hist. 45.

water among the three states (Rep. 138). This conclusion is obviously correct.

The provisions for the apportionment of water made by Congress in the Project Act and carried out by the Secretary of the Interior in his water delivery contracts render wholly inapplicable to the main stream interstate controversy presented by this case principles of equitable apportionment applied by this Court in other cases involving interstate water controversies. In those cases no apportionment had been authorized by Congress.[16] As the Master emphasized:

> "This case involves a statutory, not an equitable, apportionment. . . ." (Rep. 100)

E. Effect on Appropriative Rights

The statutory apportionment made by the Project Act also renders inapposite the law of prior appropriation (Rep. 138).

Recognition of and delivery of water pursuant to "appropriative rights", as those terms are defined and employed in water law, is wholly incompatible with the apportionment of water authorized by the Project Act.

Furthermore, management and control of the reservoir and dam for the primary purposes of improvement of navigation, flood control and river regulation necessarily preclude the operation of those works and structures to meet demands for delivery of water at the times and in the quantities required to satisfy appropriative rights. If the Secretary in managing the reservoir and dam were compelled to meet the demands of appropriative rights in point of time and quantity, it would be impossible for him to comply with the mandate of the Project Act that "the dam and reservoir

[16] See, *e.g.*, *Nebraska* v. *Wyoming*, 325 U. S. 589 (1945); *Wyoming* v. *Colorado*, 259 U. S. 419 (1922).

. . . be used: First, for river regulation, improvement of navigation and flood control; second, for irrigation and domestic uses . . .; and third, for power" (§6).

These consequences would arise from the very nature of an appropriative right. The appropriator of water is entitled, as against all subsequent claimants, to the exclusive use of the water to the extent of his appropriation, without diminution or material alteration in quantity or quality. Since appropriations vest according to and are limited by time as well as volume, an appropriator is under the obligation to divert his water at the time and in the quantities fixed when his right was established, if his failure to do so will impair rights of other appropriators. *Santa Paula Waterworks* v. *Peralta,* 113 Cal. 38, 45 Pac. 168 (1896); *Galiger* v. *McNulty,* 80 Mont. 339, 260 Pac. 401 (1927); *Davis* v. *Chamberlain,* 51 Ore. 304, 98 Pac. 154 (1908); 2 KINNEY, THE LAW OF IRRIGATION AND WATER RIGHTS 1369-73 (2d Ed. 1912); 1 WIEL, WATER RIGHTS IN THE WESTERN STATES 318 (3d Ed. 1911).

A construction of the Project Act which would require the Secretary to ascertain priority rights on the river, both as to time of vesting and quantity of water, and to manage the dam and reservoir so as to respect and satisfy these varying rights would be inconsistent with and frustrative of the clear intent of Congress expressed in the plain language of the Act.

These conclusions are supported by the legislative history of the Project Act. As introduced in the 69th Congress, §5 of the third Swing-Johnson bill provided in part that "contracts respecting water for domestic uses may be for permanent service but subject to rights of prior appropriators."[17] However, the clause subjecting contracts to prior appropriative rights was deleted in committee,

[17] H.R. 9825, 69th Cong., 2d Sess. (1926), Ariz. Legis. Hist. 5.

the permissive provision, "may be for permanent service", was stricken and the mandatory provision, "shall be for permanent service", was substituted.[18] At the same time that Congress deleted the provisions recognizing rights of prior appropriators, it added the following requirement:

> "No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated."[19]

Congress, by refusing recognition to appropriative rights and by denying any right to the use of water except by contract, evidenced a clear intent that appropriative rights should not be recognized as the basis of any claim to water stored in Lake Mead.

The legislative history further shows that Congress intended that in contracting for delivery of stored water the Secretary should be free to ignore prior appropriations. During a discussion of the effect of the Project Act on claimed appropriative rights, the following exchange occurred between Senator Johnson of California and Senator Walsh of Montana:

> "Mr. Walsh of Montana. If the City of Los Angeles has this enormous appropriation of the waters of the Colorado River, a perfected appropriation or an inchoate appropriation, does it follow, if the Government erects this dam across the Colorado River and creates a great storage basin, that it must yield up that amount of water to the city of Los Angeles?
>
> "Mr. Johnson. I rather think so, just exactly as if it were a perfected right for irrigation purposes.
>
> "Mr. Walsh of Montana. Yes; but I always understood that the interest that stores the water

[18] Ariz. Legis. Hist. 6.

[19] *Ibid.*

has a right superior to prior appropriations that do not store.

"Mr. Johnson. Possibly so. What is the point?

"Mr. Walsh of Montana. The point is that apparently, if that is correct, then this expenditure is being made with no right in the Government of the United States to control the water which is stored, but that it must go to those appropriators.

"Mr. Johnson. No; the bill provides that a contract in advance must be made for the storage of water by the Secretary of the Interior.

"Mr. Walsh of Montana. A contract with whom?

"Mr. Johnson. With those who utilize and take and appropriate the water.

"Mr. Walsh of Montana. That is to say, the Government may dispose of the stored water as it sees fit?

"Mr. Johnson. Yes; under the terms of this bill.

"Mr. Walsh of Montana. Then how can it be said that the city of Los Angeles has a perfected interest?

"Mr. Johnson. It has a perfected right there unquestionably, but the bill requires the city of Los Angeles to conform to it, and the city of Los Angeles is perfectly willing to conform to it just exactly as if it had no perfected right.

"Mr. Walsh of Montana. Am I correct in the assumption that the Government of the United States must distribute the water to the various appropriators in accordance with their several appropriations?

"Mr. Johnson. If they contract.

"Mr. Walsh of Montana. Yes; but to contract means a liberty of contract. That is what I want to know. Can the Secretary give the water to them or withhold it from them as he sees fit?

"Mr. Johnson. Certainly, because before he begins work upon the dam he has to have the con-

tract in his possession for its payment, and he is the one who is to fix the sums that are to be paid.

"Mr. Walsh of Montana. Yes, but that is quite contradictory. It seems to me that the City of Los Angeles has no rights by virtue of this appropriation.

"Mr. Johnson. Certainly it has, but those rights unquestionably will be controlled by this bill.

* * * * * * *

"Mr. Walsh of Montana. I directed the inquiry merely for the purpose of trying to find out, if I can, under what kind of obligation the Government of the United States, should it build this dam, would be to those who have the appropriations.

"Mr. Johnson. The Government would be under no obligations until it makes its terms. I seem unable to make that plain. But here is everything in this scheme, plan, or design: Everything is dependent upon the Secretary of the Interior contracting with those who desire to obtain the benefit of the construction, and he is not to undertake any expenditure nor to undertake any construction until that shall have been accomplished.

"Mr. Walsh of Montana. Let us suppose the Arizona people are perfectly willing to meet the requirements and that the Los Angeles people are perfectly willing to meet the requirements, and other people who have not even attempted to make any appropriation are perfectly able and willing to meet the requirements. Who then has the right?

"Mr. Johnson. The Secretary of the Interior and the Government have the right.

"Mr. Walsh of Montana. The Secretary of the Interior may utterly ignore those appropriations?

"Mr. Johnson. Possibly so.

"Mr. Walsh of Montana. That is what I am curious to find out about."[20]

---

[20] 70 Cong. Rec. 168 (1928), Ariz. Legis. Hist. 40-43.

Thus it is clear that it was the understanding and intent of Congress that rights to the use of stored water could be obtained only by contract with the Secretary of the Interior and that claims of appropriative rights would be without effect. Congress, in the exercise of its plenary control over the river, could have withheld all the water from users in the Lower Basin. It did not see fit to do this. Instead, it authorized the Secretary by §5 to contract for the delivery of water within the limits prescribed by §4(a) without regard to perfected or inchoate appropriative rights.

The evidence is uncontradicted that, since construction of Hoover Dam, the reservoir and dam have been operated consistently without regard to claimed appropriative rights (Tr. 828-29). The record is clear that no water users in California or elsewhere have demanded the release of water in accordance with and in satisfaction of asserted appropriative rights.

This practical construction reflects a realization on the part of all concerned that since enactment of the Project Act rights to stored water have as their basis the Act and the water delivery contracts, if made pursuant thereto, rather than any prior appropriations of water.

F. "Present Perfected Rights"

Congress in §6 of the Project Act (Appendix B, pp. 18a-19a) directed that Hoover Dam be operated in "satisfaction of present perfected rights in pursuance of Article VIII of said Colorado River compact. . . ." Article VIII of the Compact provides:

> "Present perfected rights to the beneficial use of waters of the Colorado River System are unimpaired by this compact. Whenever storage capacity of 5,000,000 acre-feet shall have been provided on the main Colorado River within or for the benefit of the

> Lower Basin, then claims of such rights, if any, by appropriators or users of water in the Lower Basin against appropriators or users of water in the Upper Basin shall attach to and be satisfied from water that may be stored not in conflict with Article III.
>
> "All other rights to beneficial use of waters of the Colorado River System shall be satisfied solely from the water apportioned to that Basin in which they are situate."

The Special Master has construed §6 of the Project Act as preserving whatever rights to main stream water in Arizona, California and Nevada were perfected when the Project Act became effective on June 25, 1929.[21]

We disagree (A Exc. 5) with the Special Master's view that the provisions of §6 of the Project Act regarding "present perfected rights" operate to preserve intrabasin rights of users within the Lower Basin states to the use of water in the main stream of the Colorado River (Rep. 234-35, 306 *et seq.*). The Special Master has found, and we agree, that the Compact "governs inter-basin relations exclusively" (Rep. 141). The Master further held that "Articles I and VIII [of the Compact] contemplate inter-basin and not interstate operation of the Compact" (Rep. 141). It is our view that §6 of the Project Act does not recognize or confirm any rights within the Lower Basin at all. Section 6 merely directs that the facilities authorized by §1 shall satisfy the requirements of Article VIII of the Compact—that claims of rights by appropriators and users in the Lower Basin against appropriators and

---

[21] The Special Master held that the Compact became effective only upon congressional consent thereto, which was given in the Project Act, and that the Act by its terms was to become effective only when the conditions of §4(a) were satisfied and the President so proclaimed. The presidential proclamation was issued on June 25, 1929 (Rep. 152 note 20).

users in the Upper Basin shall attach to and be satisfied from water stored in the Lower Basin. The only portion of Article VIII of the Compact which provides for "satisfaction" of present perfected rights is the second sentence of the first paragraph and this provision is clearly limited to the satisfaction of perfected rights basin versus basin.

An analysis of the circumstances and conditions which existed when the Compact was negotiated strongly supports this conclusion with respect to the meaning of §6.

Prior to this Court's decision in *Wyoming* v. *Colorado*, 259 U.S. 419 (1922), in an interstate stream controversy between two states, both of which applied the doctrine of prior appropriation, it was uncertain whether claims of prior appropriators in one state would prevail against junior appropriators in the other state. While the Compact Commissioners were in negotiation, that decision was rendered, holding that in such a case principles of prior appropriation are controlling.

The decision increased the concern of the Upper Basin that construction of storage facilities on the main stream would permit a rapid expansion of irrigation and other uses in the Lower Basin and form the basis for claims of appropriative rights in the water, which would preclude its availability for the more slowly developing needs of the Upper Basin (Rep. 22, 139-41).

At the same time the predicament in which the Lower Basin users might be placed if the Compact became effective before storage was made available was apparent. Since the Compact, in the absence of the protection afforded the Lower Basin by the first sentence of Article VIII, would effectively preclude the assertion of rights under priorities claimed by the Lower Basin, it would bar recourse to the

courts to require the release of water in times of shortage. Therefore, until storage was provided "within or for the benefit of the Lower Basin", the Lower Basin could not afford to relinquish its right to demand release of water by the Upper Basin in satisfaction of claimed prior rights. Accordingly, the phrase in Article VIII, "present perfected rights . . . are unimpaired", was inserted in the Compact so that Lower Basin users might assert as against Upper Basin users their legal right to demand the release of water in satisfaction of their prior claims until such time as storage facilities were provided, thereby assuring users in the Lower Basin a dependable water supply.

This clearly appears from the provision which immediately follows the first sentence of Article VIII:

> "Whenever storage capacity of 5,000,000 acre-feet shall have been provided on the main Colorado River within or for the benefit of the Lower Basin, then claims of such rights [*i.e.*, present perfected rights], if any, by appropriators or users of water in the Lower Basin against appropriators or users of water in the Upper Basin shall attach to and be satisfied from water that may be stored not in conflict with Article III."

Thus by the device of preserving perfected rights *basin versus basin* until storage was available, protection was afforded main stream Lower Basin users. After storage was provided as contemplated by Article VIII of the Compact, the first sentence of Article VIII had served its purpose and had no further effect.

The Upper Basin, on the other hand, required assurance that the Lower Basin, once storage should become available to it, would not claim rights in excess of the guarantee of

supply found in Article III of the Compact. Accordingly, Article VIII required that water should be stored "not in conflict with Article III" and that all claimed prior rights in the Lower Basin should be, in effect, discharged and released as against the Upper Basin whenever suitable storage facilities were provided "on the main Colorado River within or for the benefit of the Lower Basin."

But even if the first sentence of Article VIII of the Compact may properly be construed as a general guarantee that the Compact would not operate to affect prior perfected rights, it does not follow that §6 of the Project Act was intended to have that effect. It will be observed that §6 of the Project Act does not provide, as does the first sentence of Article VIII, that "present perfected rights . . . are unimpaired". To the contrary, Congress expressly rejected a proposed provision designed to protect appropriative rights (pp. 42-43, *supra*) and §6 says nothing about either impairing or preserving perfected rights. It speaks in terms of "satisfaction" of such rights as contemplated by Article VIII of the Compact. Since this provision of the Compact regarding satisfaction of perfected rights is limited to rights basin versus basin and does not apply to intrabasin rights (Rep. 141), it may not properly be inferred that §6 goes beyond the scope of this provision of Article VIII and operates to preserve perfected rights within the Lower Basin.

Instead of preserving appropriative rights of main stream users, the Compact contemplated that those rights, if any, would be extinguished once storage was provided "within or for the benefit of the Lower Basin". This conclusion follows logically when the Compact scheme for supplying main stream water to Lower Basin users is con-

sidered in connection with the essential nature of an appropriative water right.

Since an appropriative right is fixed and measured in relationship to the supply available from the natural flow of the stream, once the natural flow is destroyed no standard survives by which to determine the users who may take or how much each may divert. An appropriative right does not entitle the user to a full supply of water for a given acreage and may be fully satisfied only if there is enough water in the river "as it was wont to flow" when the right was acquired (pp. 41-42, *supra*). The natural flow of the river, which might be available to junior users for a portion of the year, may not be impounded so as to reserve for senior users a year-round water supply. The holder of a senior right to the natural flow has no greater claim to stored water than does a junior appropriator, since the right of the senior user is not to stored water but only to the natural flow.

The right given the Upper Basin in Article III(d) of the Compact to discharge its water delivery obligation to the Lower Basin without regard to the natural flow of the river clearly demonstrates that the intended preservation of priority of right was not to continue after storage was provided for users in the lower Basin.

The entire approach of the Compact to the problem of allocation between the two Basins of the available water supply rising in the Upper Basin is at variance with a recognition of appropriative rights within the Lower Basin. The fact that the Upper Basin in its sole discretion might vary the supply from year to year, so long as in each consecutive ten-year period the aggregate obligation of Article III(d) was fully discharged, cuts squarely across the theory of a preservation and satisfaction of rights in

natural flow. That this is true is demonstrated by the fact that the storage contemplated in Article VIII would destroy all possibility of measuring and determining the amount of water which a holder of a claimed prior right might be entitled to require at any given time.

The conclusion, therefore, is clear that users in the Lower Basin surrendered their claimed prior appropriative rights in the natural flow of the river (which was silt-laden, given to violent floods and prone to seasonal fluctuations in supply) in exchange for rights to receive from storage a guaranteed average supply of desilted water from a flood-controlled river.

The Special Master, although refusing to accept our construction of §6 and Article VIII, has concluded that a water right is a "present perfected right" within the protection of §6, if it was acquired in compliance with the formalities of state law, but only to the extent that it represented an actual diversion and beneficial use of a specific quantity of water applied to a definite area of land or to a particular domestic or industrial use (Rep. 308).[22] With this definition of "perfected right" we agree.

---

[22] The water rights of federal establishments in the Lower Basin have been exempted by the Special Master from compliance with the formalities of state law as a basis for their acceptance, since he holds that the United States has the power to reserve water for the future needs of these establishments independently of state law and even though there has been no actual diversion or beneficial use of any specific quantity of water. To the contrary, the Special Master holds these rights are superior to subsequent appropriations under state law, although the subsequent appropriator may divert and use the water prior to any diversion and use in a federal establishment. Accordingly, a reservation of water by the United States before June 25, 1929 is accorded the protection given by §6, even though, as of that date, the right was not acquired under state law and all the water reserved had not been put to beneficial use (Rep. 257-66, 309-10). These conclusions, with which we disagree, are discussed in Part II of this brief.

However, on the premise that "a statute speaks as of its effective date", the Special Master reasons that the phrase, "present perfected rights", as employed in §6 of the Project Act, means rights perfected when the Act became effective on June 25, 1929 (Rep. 152 note 20).

As we have previously pointed out, the effect of Article VIII of the Compact on perfected rights is limited to claims basin versus basin (pp. 47-49, *supra*). But if that Article was intended to provide for the satisfaction of perfected rights intrabasin, analysis of the Project Act and the provisions of the Compact establishes that §6 was intended to relate only to those rights which were perfected on the date when the Compact was signed.

Although generally a statute "speaks as of" its effective date, nevertheless a statute often does "speak with reference to" circumstances, conditions or things existing at a time antecedent to its effective date.[23]

The Project Act contains no general provision for the satisfaction or preservation of all perfected rights, and the direction of Congress found in §6 that there be satisfaction of present perfected rights "in pursuance of Article VIII of said Colorado River compact" clearly requires that only the present perfected rights referred to by that Article of the Compact be discharged and satisfied. Had the Compact, in place of the phrase "present prefected rights", used the expression, "rights perfected on or before the 24th day of November, 1922", there can be no doubt that the effect of §6 would be limited to the satisfaction of rights perfected

[23] For example, state legislation conferring tax exemptions and other benefits upon veterans commonly restricts such benefits to those who were residents of the state prior to a specified date. Ariz. Const., Art. IX, §2; Ariz. Rev. Stat. Ann. §42-271 (1956); Cal. Stat. 1953, c. 1219, §1.

on or before November 24, 1922, even though the Project Act and the Compact did not become effective until December 25, 1929. Hence, in determining what perfected rights were intended to be satisfied, the meaning of the Compact phrase, "present perfected rights", must be ascertained.

In *Hinderlider* v. *La Plata River & Cherry Creek Ditch Co.*, 304 U. S. 92 (1938), the Court dealt with the power of a state to enter into a compact regarding the water of interstate streams. It is clear from that decision that there is no compulsion on compacting states to honor, preserve or satisfy so-called vested rights to the use of water of interstate streams, even though such "rights" have been adjudicated by state courts prior to the compact and are binding upon a state and its citizens. As between states, such rights are not binding, and an apportionment of water by interstate compact may be validly made in disregard of these rights. The states negotiating the Colorado River Compact were under no legal obligation to make any provision in the Compact insuring the preservation or satisfaction of rights to the use of water of the Colorado River which might exist either at the time the Compact was negotiated or at the time the Compact was ratified and approved. The extent to which provision was made in the Compact for satisfaction of such rights must be determined by an interpretation of the language employed in the Compact, viewed in the light of surrounding circumstances and the objectives intended to be accomplished by the Compact.

It will be observed that Article VIII of the Compact carefully specifies "*present*" perfected rights. The natural and unstrained meaning of this term is that it was intended

to cover only those rights existing at the date the Compact was signed. It must have been apparent that a compact, which sought to compose problems as important and controversial as those dealt with by the Compact Commissioners and which were not resolved by them until after protracted negotiations extending over a period of almost a year, would not receive speedy approval by the legislatures of the Colorado River Basin states and the Congress of the United States. Had it been intended that the Compact, in providing for the satisfaction of present perfected rights, should cover rights which were perfected after the signing of the Compact but before its approval and ratification by the United States and the Colorado River Basin states, language clearly expressing that intent would have been employed.

One of the difficulties with which the Compact negotiators had to deal was the claim of prior vested rights. This problem was prominent among those which caused the Compact negotiators to abandon an effort to reach a division of water among the states and to content themselves with an apportionment between the basins, leaving the more difficult problem of division among the states of the two basins for future negotiation and settlement. Under these circumstances, it seems most unlikely that the Compact negotiators would have done more than make provision for the preservation or satisfaction of rights then perfected. It is not reasonable to assume that they intended to add to the difficulties of a problem which they had been unable to resolve, by providing in the Compact for the recognition of additional rights not then in existence.

G. Summary

To summarize: In enacting the Project Act Congress exercised the power conferred upon it by the Commerce Clause over the waters of the Colorado River as a navigable stream of the United States. The construction of Hoover Dam and the creation of Lake Mead, as authorized by Congress, caused all water in the main stream of the river at the site of the dam and reservoir to be impounded and stored in Lake Mead.

Congress also provided for the apportionment among Arizona, California and Nevada of the water thus impounded and stored. Such apportionment renders irrelevant and inoperative the principles and considerations which are material in a case involving the equitable apportionment of water between states.

The Project Act, properly construed, neither recognizes nor preserves any appropriative or "present perfected rights" *intrabasin*. It provides for the satisfaction and discharge of such rights only *basin versus basin*.

If, however, it should be held that any intrabasin rights were preserved by §6 of the Project Act, such protection is afforded only to a right which was perfected under state law as of November 24, 1922, and then only to the extent that it represented an actual diversion and beneficial use of a specific quantity of water applied to a definite area of land or to a particular domestic or industrial use.

The meaning, extent and effect of the statutory apportionment remain to be considered.

II

The Project Act provides for the storage of main stream water only and for its allocation among Arizona, California and Nevada.

The Project Act was not to take effect until certain conditions precedent set forth in §4(a) were met (p. 16, *supra*). Among these conditions was the requirement that California should agree irrevocably and unconditionally:

> ". . . that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact."

In addition, §4(a) authorized Arizona, California and Nevada to enter into an agreement which should provide, among other things:

> ". . . (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive

beneficial consumptive use of the Gila River and its tributaries within the boundaries of said state. . . ."

The principal contention upon which California rests her case, namely, that §4(a) deals with both main stream and tributary water, was rejected by the Special Master (Rep. 177-79). We agree with his conclusion that the foregoing provisions deal with main stream water only—that the words of §4(a) and the substantially identical language of the California Limitation Act (Appendix C, pp. 27a-28a), *viz.*, "waters apportioned to the lower basin states by paragraph 'a' of article three of the said Colorado River compact" and "excess or surplus waters unapportioned by said compact", refer to "the water stored in Lake Mead and flowing in the mainstream below Hoover Dam" (Rep. 173).

The Special Master's conclusion is supported by other provisions of the Project Act, the general operative plan which they establish and the legislative history of the statute.

1. Interpretation of the phrase, "waters apportioned to the lower basin states by paragraph (a) of Article III" (Project Act §4(a))

A. Provisions and Purposes of the Project Act

One of the stated purposes of the Project Act is "regulating the flow of the Colorado River"—not the Colorado River *System*. Another stated purpose is to provide "for storage and for the delivery of the stored waters thereof", *i.e.*, of "the Colorado River" (§1, Appendix B, p. 9a).

To achieve these purposes, among others, the Secretary of the Interior was "authorized to construct, operate, and maintain a dam and incidental works *in the main stream of the Colorado River* at Black Canyon or Boulder Canyon

adequate to create a storage reservoir of a capacity of not less than twenty million acre-feet of water. . . ." (§1)

Pursuant to the authority thus conferred, Hoover Dam —"the principal structure in the Lower Basin, impounding the waters of the Colorado River to form Lake Mead"— was erected "in Black Canyon on the main channel of the Colorado River" (Rep. 32). And, as the Special Master stated, "Congress realized that the dam authorized by the Project Act would impound substantially all the water of the mainstream. . . ." (Rep. 153)

The Limitation Act requirement of §4(a) restricts California to "the aggregate annual consumptive use (diversions less returns to the river) *of water of and from the Colorado River*"—not the Colorado River System—clearly a reference to main stream water.

Section 5 (Appendix B, pp. 14a-15a) authorizes the Secretary of the Interior "to contract for the storage of water in said reservoir and for the delivery thereof. . . ." The storage referred to is that provided for in §1, *i.e.*, storage of water "in the main stream of the Colorado River"—not the Colorado River System.

Section 6 (Appendix B, pp. 18a-19a) sets forth the purposes for which the "dam and reservoir provided for by section 1 . . . shall be used"; and §1, as we have said, provides that the dam and reservoir authorized by the Act shall be "for the purpose of controlling the floods, improving navigation and regulating the flow of the Colorado River" —the main stream.

The water allocation among the Lower Basin states authorized by §4(a) of the Project Act also demonstrates the intent of Congress to deal with main stream water only. Thus, as the Special Master held:

> "Section 4(a) contemplates the division of the water referred to therein only among the three states

> of the Lower Basin which have geographic access to water flowing in the mainstream of the Colorado River, namely, Arizona, California and Nevada." (Rep. 170)

And as the Master stated:

> "Certainly Congress intended that the water, to a portion of which California was limited by Section 4(a), would be mainstream water only. The very language of the Section—it refers to the Colorado River and not to the System—points in this direction. But more important, the second paragraph of Section 4(a) demonstrates that Congress considered the limitation on California to be part of an overall allocation of the entire quantity of water dealt with in that Section among three states only: of the first 7.5 million acre-feet—4.4 to California, 2.8 to Arizona, and .3 to Nevada; the balance to California and Arizona equally." (Rep. 174)

Thus the division of water provided for in §4(a) disposed entirely of the 7,500,000 acre-feet, which are referred to as waters apportioned to the Lower Basin by Article III(a) of the Compact. This disposition, as the Master noted, makes no provision whatever for any apportionment to Utah or New Mexico, and it limits Nevada to 300,000 acre-feet annually (Rep. 175-76). Among the leading proponents of the §4(a) apportionment were the senators from Nevada (Pittman), Utah (King) and New Mexico (Bratton). Had the senators from Utah and New Mexico believed that the proposed §4(a) was intended to recommend a division of water among Arizona, California and Nevada which included water of Lower Basin tributaries in Utah and New Mexico, it is inconceivable that they would not have vigorously opposed these provisions instead of sponsoring and strongly advocating their adoption. It is

also most unlikely that, had Senator Pittman (Nevada) construed §4(a) as involving the water of tributaries, he would have remained silent on the subject or have taken so prominent a part, as he did, in the formulation and advocacy of §4(a).

These circumstances caused the Special Master to conclude that a construction of §4(a) as apportioning water of tributaries as well as of the main stream would require that he "attribute to Congress an intent to deprive two of the states having Lower Basin interests of any participation in the Lower Basin apportionment" (Rep. 175).

The fact that Congress proposed an apportionment among *three* rather than *five* states having Lower Basin interests, and only among those three states which geographically have access to water of the main stream, in the Master's words, "strongly indicates that the congressional intention was to provide only for the apportionment of mainstream water" (Rep. 176).

B. Legislative History of §4(a)

The historical background and legislative history of §4(a) also show that Congress intended by the enactment of the section to deal with main stream water only—that Congress construed Article III(a) of the Compact as apportioning only main stream water to the Lower Basin or at any rate employed its references to Article III(a) to signify water of the main stream only.

A brief review of the circumstances following the negotiation of the Compact and prior to the enactment of the Project Act will demonstrate this.

After the Compact had been signed, it was approved by all the states of the Colorado River Basin, except Arizona (Rep. 24-25). Between 1922 and 1927, California's representatives in Congress introduced measures which would

have authorized construction of a dam at Boulder Canyon and an All-American Canal, all of which failed of enactment (Rep. 27).[24] During the years 1925 through 1927, negotiations between Arizona, California and Nevada looking toward a compact dividing the water apportioned to the Lower Basin by the Compact were unsuccessful.[25]

In 1927 the Governors of the seven Colorado River Basin states convened in an effort to bring about seven-state ratification of the Compact. The Governors of the states of the Upper Division adopted a resolution recommending that, "of the average annual delivery of water to be provided by the States of the upper division at Lees [*sic*] Ferry, under the terms of the Colorado River compact", there be apportioned to Nevada 300,000 acre-feet, to Arizona 3,000,000 acre-feet and to California 4,200,000 acre-feet.[26]

Clearly, this suggested apportionment was of water in the main stream of the Colorado River, since the water referred to was that required by the Compact to be delivered annually "at Lees Ferry"—described by the Compact as "a point in the main stream of the Colorado River one mile below the mouth of the Paria River" (Art. II(e), Appendix A, p. 2a). It is also plain that the water referred to was that apportioned by Article III(a) of the Compact, for the total quantity dealt with by the Governors aggregated 7,500,000 acre-feet per annum, exactly the same quan-

[26] 70 Cong. Rec. 172 (1928), Ariz. Legis. Hist. 51-52.

tity which was apportioned to the Lower Basin by Article III(a).[27]

This fact is further evidenced by the distinction drawn by the Governors between the water thus divided and "water to be supplied from the tributaries of the Colorado River flowing in" Arizona and "waters of the tributaries of the Colorado River emptying into the river below Lees Ferry", of which a separate and different disposition was recommended.[28]

Congress was well aware of the resolution adopted at the Governors' Conference, and in fact the division of water among the Lower Basin states recommended by the Governors of the Upper Division states was the starting point for the compromise finally worked out in the Senate and incorporated in §4(a) of the Project Act.

When the fourth Swing-Johnson bill was considered by the Senate the Governors' proposals had not been accepted, primarily because of California's demand that it should have 4,600,000 acre-feet of the water of the Colorado River and Arizona's insistence that California should be limited to 4,200,000 acre-feet.[29]

---

[27] The Governors were contemporaries of the negotiators of the Compact. Indeed, Governor Emerson of Wyoming, who voted for the resolution passed at the Governors' Conference, had been the Compact Commissioner for Wyoming.

[28] It was suggested that there be apportioned to Arizona 1,000,000 acre-feet of water from tributaries flowing in Arizona, to be diverted from the tributaries before they empty into the main stream; and it was proposed further that each of the Lower Basin states should have the exclusive use of all water of tributaries within the boundaries of the state which empty into the Colorado below Lee Ferry, before those waters empty into the main stream. 70 Cong. Rec. 172 (1928), Ariz. Legis. Hist. 53.

[29] 69 Cong. Rec. 10259 (1928), Ariz. Legis. Hist. 22-23; 70 Cong. Rec. 171, 172 (1928), Ariz. Legis. Hist. 50-57.

Such was the Arizona-California controversy over water and the impasse to its settlement when in 1928 Congress took up for consideration and debate the fourth Swing-Johnson bill, which was ultimately to be enacted as the Project Act.

The Arizona-California controversy and the recommendations of the Governors' Conference for its settlement were considered at length by the Senate in the debate on the fourth Swing-Johnson bill. Senator Pittman, who had attended the Conference, gave the Senate a summary of its proceedings, including the proposals made for division among the three Lower Basin states of the water to be delivered by the Upper Basin at Lee Ferry. He explained that in dividing this water the Governors had dealt with the 7,500,000 acre-feet apportioned to the Lower Basin by Article III(a) of the Compact. He then quoted the language of Article III(a) and concluded:

> "In other words, those State governors believed that there was only 7,500,000 acre-feet of water to divide, and they proposed to divide it, as I have said, 4,200,000 acre-feet to California, 3,000,000 acre-feet to Arizona, and 300,000 acre-feet to Nevada.
>
> "California said 'We can not possibly do with that amount of water; we must have 4,600,000 acre-feet instead of 4,200,000 acre-feet.' Arizona would not yield more . . . ."[80]

The Senate fully recognized the pressing necessity for a settlement of the Arizona-California controversy and Senators expressed regret that a difference of 400,000 acre-feet of water was preventing its solution.

The Senate finally split the difference by providing in §4(a) of the Project Act for the apportionment of Article

[80] 69 Cong. Rec. 10259 (1928), Ariz. Legis. Hist. 23.

III(a) water as follows: not to exceed 4,400,000 acre-feet to California, 300,000 acre-feet to Nevada and 2,800,000 acre-feet to Arizona.[31]

In arriving at this compromise the Senate unquestionably was dealing with water in the main stream of the Colorado River. The division was patterned upon the apportionment suggested by the Governors' Conference, which was an apportionment of main stream water.

For example, Senator Hayden, referring to the Governors' Conference, reported that the conferees had suggested the following division of water:

> "1. Of the average annual delivery of water to be provided by the States of the upper division at Lees [*sic*] Ferry under the terms of the Colorado River compact:
>
> (a) To the State of Nevada 300,000 acre-feet.
>
> (b) To the State of Arizona, 3,000,000 acre-feet.
>
> (c) To the State of California, 4,200,000 acre-feet."[32]

Senator Pittman further stated:

> "Arizona, as I understand, will ratify the agreement whenever there shall be a provision in the bill or a separate agreement between Nevada and Arizona and California dividing the water *let down to the three lower States.* Of the 7,500,000 acre-feet of *water let down that river* they have gotten together within 400,000 acre-feet. They have got to get together, and if they do not get together Congress should bring them together."[33]

---

[31] 70 Cong. Rec. 164, 232, 333, 385, 386 (1928), Ariz. Legis. Hist. 29-30, 67, 71, 88-89, 94-97.

[32] 70 Cong. Rec. 172 (1928), Ariz. Legis. Hist. 51.

[33] 70 Cong. Rec. 232 (1928), Ariz. Legis. Hist. 67.

Senator Pittman, in depicting the situation which might arise in the absence of a compromise, stated:

> "In other words, there are only 15,000,000 acre-feet *in the river*. Seven million five hundred thousand are forever to be retained in the upper States, to be put in use some time in the future.
>
> "Now, unless there was an agreement as to exactly how much water should go to the lower States *out of the 7,500,000 acre-feet that went down to them*, what might be the result? If Arizona stays out of the agreement, she would have her legal right to appropriate as much water as she could put to beneficial use. On the other hand, California would only be restricted by the *7,500,000 acre-feet that went down*, with the result that there would be nothing in the compact to prevent California from using the entire 7,500,000 acre-feet and there would be nothing in the compact to prevent Arizona from using the 7,500,000 acre-feet if she never went into the compact."[34]

Finally, Senator Pittman, in discussing the Hayden amendment to §4(a), which eliminated the Gila River from the terms of any Mexican Treaty, stated:

> "As I understand this amendment, Arizona to-day has practically allocated to it *2,800,000 acre-feet of water in the main Colorado River*. It is there for their use. As I understand it, they are willing to give up any amount that may be necessary to meet the demands of Mexico from that 2,800,000 acre-feet, provided it is matched by an equal amount of water out of California's allocation of 4,400,000 acre-feet."[35]

These repeated references in the congressional debate on §4(a) to "water let down to the three lower States", to

---

[34] 70 Cong. Rec. 386 (1928), Ariz. Legis. Hist. 93.

[35] 70 Cong. Rec. 469 (1928), Ariz. Legis. Hist. 126.

"water let down the river", to "the 7,500,000 acre-feet that went down to them" and to Arizona's share as "2,800,000 acre-feet of water in the main Colorado River", referred and could only have referred to water in the main stream. They compel the conclusion reached by the Special Master that:

> "It is clear that Congress intended Section 4(a) of the Project Act to apply only to the mainstream . . . ." (Rep. 173)

C. The Water Dealt With By Article III(a) of the Compact

We agree with the Special Master's conclusion that, since the Compact made no division of water among the Lower Basin states, it is not relevant to the allocation among Arizona, California and Nevada of water from Lake Mead and from the main stream of the river below Hoover Dam (Rep. 138-41). However, against the eventuality that the Court may differ with this conclusion, the Report sets forth the Master's interpretation of the Compact. It is only against this same eventuality that Arizona has noted, by her exceptions to the Report, disagreement with the Master's understanding of the Compact (A Exc. 1, 2).

(1) The congressional interpretation of Article III(a) of the Compact is controlling.

The Master construes the Compact as a separate and independent document wholly apart from and without reference to the Project Act (Rep. 138-51). In this we believe he is in error. The Compact cannot be properly construed apart from the Project Act, since it was not to become "binding and obligatory" until approved by the Congress of the United States (Compact Art. XI, Appendix A, p. 7a).

Further, since the consent of Congress is a condition precedent to the effectiveness of an interstate compact

(U. S. Const. art. I, §10), the interpretation given such a compact by Congress in consenting to it is controlling, for otherwise there would be no true congressional consent. Therefore, it is the congressional construction of the Compact embodied in the Project Act and subsequently accepted by the states, which is controlling and conclusive.

The meaning which Congress ascribed to the Compact in enacting the Project Act is clearly manifested by the legislative history of the statute. California had pressed for enactment of the predecessor Swing-Johnson bills through three Congresses and had been opposed not only by Arizona, but by the Upper Basin states as well. Had California advanced during the Senate debates her present interpretation of Article III(a) of the Compact and the references to it in the Limitation Act (see Rep. 177-78; p. 58, *supra*), there is little doubt that the Project Act would not have been passed, at least until and unless California had receded from her position. This is made clear by the following facts.

The Upper Basin states were vitally concerned lest, without Arizona's ratification of the Compact, California would put to use large quantities of main stream water and Arizona, free from any Compact restrictions and having large areas of irrigable land, would develop this land before the Upper Basin states could develop theirs. The Upper Basin feared that Arizona would claim prior rights to water for her land and that consequently the obligation of the Upper Basin to release water for use in the Lower Basin would be enlarged above the Compact apportionment.

The Upper Basin understood that its obligation to deliver water to the Lower Basin arose from and was limited by paragraphs (a) and (d) of Article III of the

Compact. This also was the understanding of Congress. Senator Pittman, discussing the Phipps amendment, stated:

> "Mr. President, I want to say that the amendment of the Senator from Colorado (Mr. Phipps) now offered is substantially recommended by the committee. The bill as originally introduced by the Senator from California (Mr. Johnson) had no reference in it to water at all, but it became evident to the committee that there had to be some reference with regard to water because not only were the States of California and Arizona interested in this larger supply of water but the four upper States were interested as well. This amendment was offered in committee by the Senator from Wyoming (Mr. Kendrick) for the purpose of protecting the water rights of the four upper States. In other words, there are only 15,000,000 acre-feet in the river. Seven million five hundred thousand are forever to be retained in the upper States, to be put in use some time in the future.
>
> "Now unless there was an agreement as to exactly how much water should go to the lower States out of the 7,500,000 acre-feet that went down to them, what might be the result? If Arizona stays out of the agreement, she would have her legal right to appropriate as much water as she could put to beneficial use. On the other hand, California would only be restricted by the 7,500,000 acre-feet that went down, with the result that there would be nothing in the compact to prevent California from using the entire 7,500,000 acre-feet and there would be nothing in the compact to prevent Arizona from using the 7,500,000 acre-feet if she never went into the compact.
>
> "So the upper States said: 'We have got to be assured that there is not used in the lower basin more than the 7,500,000 acre-feet, because, if there is more used, then when we get ready to use it in the future it will not exist under the law of appropria-

tion that applies in that section of the country.' Consequently, in view of the fact that Arizona might never go into the compact, might never be bound by compact, might be perfectly free to exercise her equal right and put to use as much as she could put to beneficial use, it was said in the committee, 'If Arizona does not come in and if it is limited to six States only, then we must be assured that California will not take the full 7,500,000 acre-feet and then Arizona take some more.' So the Senator from Wyoming (Mr. Kendrick) offered an amendment in committee, to which the committee agreed, and that amendment provided that California should never consumptively use of the Colorado River over 4,600,000 acre-feet.

* * * * * *

"Let me now call attention to the fact that the committee adopted the Kendrick amendment. They adopted the amount that California demanded, which was 4,600,000 acre-feet. I voted for that amendment. Why? I voted for it because otherwise Arizona would not participate in the compact and would not participate in the division of water. In other words, it was apparent to me that California was so dissatisfied with it that we had to treat without Arizona. We treated without Arizona in the committee, and we put the amount in there that California demanded before the four governors at Denver [*sic*].

* * * * * *

"Mind you, this 6-State agreement is only an expedient. It is not what any of the seven States want. All of the seven States want a fair treaty between the seven States, and we have been striving to that end for several years. It looks to me as though we are on the eve of getting an agreement.

* * * * * *

"I think it would be a terrible mistake when everyone has reached the point of compromise as we have

here. If California's allotment is reduced 200,000 acre-feet out of 7,500,000 and Arizona concedes 200,000 acre-feet to California for the purpose of compromise, we should vote for it, because if we do not bitterness is bound to exist between these States. *If we do not, there have got to be a number of other provisions in the bill to satisfy the other States, because there is fear in the four upper States with regard to any kind of a ratification except by all the States.*''[36]

Immediately following this explanation by Senator Pittman and after a brief interchange between Senators Hayden and Johnson, the Senate compromised the dispute by limiting California to 4,400,000 acre-feet of water annually.

It is quite clear, therefore, that Congress intended to limit California to the use of not more than 4,400,000 acre-feet of water per year of the supply which the Compact obligated the Upper Basin to release to the Lower Basin.

It is also clear that Congress equated the Article III(d) delivery obligation, requiring the release by the Upper Basin to the Lower Basin of 75,000,000 acre-feet of water in every ten-year period, with the 7,500,000 acre-feet apportioned to the Lower Basin by Article III(a). Following the adoption of the Bratton amendment to the Phipps amendment limiting California to an annual use of 4,400,000 acre-feet per year ''of the waters apportioned to the lower basin States by the Colorado River compact'', Senator Phipps offered a change in the language of his amendment with this explanation:

''Referring to the amendment which is now before the Senate, in order to remove any possible mis-

[36] 70 Cong. Rec. 386 (1928), Ariz. Legis. Hist. 93-96.

> understanding regarding the 4,400,000 acre-feet of water, I desire to perfect the amendment by inserting, on page 3, line 4, after the word 'by,' the words 'paragraph (a) of article 3 of,' so that it will show that that allocation of water refers directly to the seven and one-half million acre-feet of water that are mentioned in paragraph 3."[37]

Without objection, this modification of the Phipps amendment was permitted.

In reliance upon the foregoing understanding of the Compact, the Upper Basin states supported the Project Act and Congress authorized the expenditure of millions of dollars for construction of Hoover Dam and the All-American Canal, all to the great benefit of California.

The words of Justice Jackson, concurring in *West Virginia ex rel. Dyer* v. *Sims,* 341 U. S. 22, 36 (1951), are applicable:

> "After Congress and sister states had been induced to alter their positions and bind themselves to terms of a covenant, [California] . . . should be estopped from repudiating her act."

(2) The Compact apportioned main stream water.

Even without reference to the congressional interpretation, however, the Compact, properly understood, apportioned only main stream water.

The Master has construed Article III(a) of the Compact as dealing with both the main stream and tributaries of the Colorado River (Rep. 142-51). Having thus interpreted the Compact and having also found that §4(a) of the Project Act deals only with water in the main stream of the river, the Master was obliged to conclude that Congress did not use the phrase, "waters apportioned to the lower basin States by paragraph (a) of Article III of the

[37] 70 Cong. Rec. 459 (1928), Ariz. Legis. Hist. 100.

Colorado River compact", in the same sense as these words were used in the Compact. He considered the congressional reference to Article III(a) solely as "shorthand" for "7,500,000 acre-feet per annum"; and he found that Congress intended, in limiting California to 4.4 million acre-feet of "the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact", simply to limit California's annual use of water to 4.4 out of the first 7.5 million acre-feet of main stream water available to the Lower Basin. Accordingly, he concluded: "I hold that Section 4(a) of the Project Act and the California Limitation Act refer only to the water stored in Lake Mead and flowing in the mainstream below Hoover Dam, despite the fact that Article III(a) of the Compact deals with the Colorado River *System,* which is defined in Article II(a) as including the entire mainstream and the tributaries." (Rep. 173) (Master's italics)

We differ with this reading of the Compact. In our view, Congress correctly understood and accurately employed the clause of the Compact to which reference is made in §4(a), *i.e.*, "waters apportioned . . . by paragraph (a) of Article III of the . . . compact", as covering main stream water only, to the exclusion of water of tributaries. We base our position upon the terms of the Compact, considered in the light of the problems and conditions confronting its negotiators.

The acknowledged fact that the Compact division of water is made only between Upper and Lower Basins (Rep. 138-41), when regarded in the setting of the conditions which created the need for an interbasin agreement, leads to the conclusion that the apportionment made by the Compact to the Lower Basin was of main stream water only.

We have previously described the geography of the Colorado River Basin (pp. 10-11, *supra;* see Rep. 9-14),

which shows clearly that the only water available to both the Upper and Lower Basins and to *which both could lay claim* was water rising in the Upper Basin and descending to the Lower. The Compact was designed to accomplish a settlement of the conflicting claims of each basin to this water.

We have also reviewed the conditions—the climatic, topographical and agricultural differences between the two basins, the contrast between their respective rates of growth and expansion, the need and desire of the Lower Basin for the erection of structures on the river which would insure flood control and a stable water supply to the Lower Basin, the fears of the Upper Basin that expanded use of water in the Lower Basin would give rise to claims of water rights in the Lower Basin prior and superior to those of the Upper Basin—which brought about the appointment of the Compact Commissioners and caused them to compromise and agree upon a division of Colorado River water between the two basins rather than among the Colorado River Basin states (pp. 11, 13, 68, *supra*).

The water which the Commissioners sought to divide was certainly not the water of Lower Basin tributaries. The Upper Basin was not interested in Lower Basin tributaries. Its fears concerned Lower Basin claims to water originating in the Upper Basin. Its guiding purpose was to reserve as much of that water as possible. The water of tributaries in the Lower Basin was of no concern to the Upper Basin for the simple reason that this water was not and could never be physically available for use in the Upper Basin and therefore the Upper Basin could have no claim thereto.

The Upper Basin negotiators had as their main objective an agreement requiring the release of a minimum of water, thereby protecting the Upper Basin during its compara-

tively slow development from claims of extensive prior appropriative rights in the Lower Basin. On the other hand, Lower Basin negotiators had as their primary aim an agreement which would require the release of a maximum of water by the Upper Basin. This dominating purpose to apportion main stream water interbasin and not interstate is reflected and accomplished by the terms of the Compact.

It is true, as the Special Master notes, that Article II(a) of the Compact defines the "Colorado River System" as "that portion of the Colorado River and its tributaries within the United States of America", that Article III(a) apportions "from the Colorado River Sytem . . . the exclusive beneficial consumptive use . . . of water", and that Article III(b) permits the Lower Basin "to increase its beneficial consumptive use of such waters".

The Master concludes from these provisions that Article III(a) and (b) necessarily refer to water *of* the "System" as defined in Article II(a), *i.e.*, to main stream and tributary water (Rep. 142-43). This conclusion, however, disregards the fact that the water apportioned by Article III(a) is not water *of* the System but water *"from"* the System and that Article I of the Compact declares that only "an apportionment of the use of *part* of the water of the Colorado River System" is made. In fact, Article III(f) and (g) make provision for "further equitable apportionment of the . . . waters of the . . . System . . . at any time after October first, 1963, if and when either Basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b)". Article VI provides for consideration and adjustment of "any claim or controversy . . . between any two or more of the signatory states . . . with respect to the waters *of* the Colorado River System *not covered* by the terms of this Compact".

The Master rejects Arizona's position that the foregoing provisions indicate that only main stream water was apportioned to the Lower Basin by the Compact. He considers Article I to be consistent with Article III(f) and (g), in that the latter provisions simply contemplated a further equitable apportionment "of remaining *System* water" (Rep. 143). But if, as the Master says, "Article VI demonstrates that the Compact governs inter-basin and not interstate relations" (Rep. 143), it is hard to see how "a further equitable apportionment" could include water of Lower Basin tributaries, which was and is physically inaccessible to the Upper Basin.

In this connection, it is to be noted that the Compact divides the Colorado River Basin, as therein defined, into the Upper and Lower Basins and fixes the dividing point between the two at Lee Ferry, Arizona—"a point *in the main stream* of the Colorado River one mile below the mouth of the Paria River" (Art. II(e)).

Not only is Lee Ferry made the dividing point between the two basins, but it is also the point at which the Upper Basin is required to deliver to the Lower Basin water "*from* the Colorado River System". By Article III(d) the states of the Upper Division guarantee that the "flow of the river at Lee Ferry" shall not "be depleted below an aggregate of 75,000,000 acre-feet for any period of ten consecutive years".

Similarly, Article III(c) provides that, in the event "surplus" water, as there defined, should prove insufficient to satisfy any rights which may be recognized in Mexico "to the use of any waters of the Colorado River System", the burden of the deficiency shall be borne equally by the Lower and Upper Basins and, whenever necessary, "the

States of the Upper Division shall deliver at Lee Ferry water to supply one-half of the deficiency . . . ."

Article V provides that state and federal officials shall cooperate "to secure the ascertainment and publication of the annual flow of the Colorado River at Lee Ferry". It was important to ascertain annual flow at Lee Ferry because Lee Ferry is the delivery point where water is to be let down to the Lower Basin by the Upper Basin in discharging its obligations under the Compact. If water of Lower Basin tributaries had been included in the apportionment, provision for its measurement would have been made.

Subdivision (e) of Article III provides that the states of the Upper Division "shall not withhold water" and the states of the Lower Division "shall not require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses." These terms necessarily refer to main stream water at Lee Ferry, because it is physically impossible for the Upper Division to "withhold" water of Lower Basin tributaries—water over which the Upper Division has no control. Conversely, to have required the Upper Division to deliver at Lee Ferry water of Lower Basin tributaries would have imposed an obligation impossible of performance.

The Colorado River Commissioners, in deliberately selecting Lee Ferry as the dividing point between the two Basins and as the delivery point of water to be let down from the Upper to the Lower Basin, recognized the fact that Lower Basin tributary water was not available for the interbasin apportionment made by Article III of the Compact.

The Master apparently overlooked the significance of Lee Ferry as the dividing point between the two Basins and as the delivery point of the water to be let down by

the Upper Basin. At least, he does not discuss the subject in his Report.

The Master also rejects Arizona's claim that Article III(a) and III(d) are correlative and therefore that Article III(a) relates to the main stream. Despite the fact that the 75,000,000 acre-feet referred to in III(d) is exactly ten times the 7,500,000 acre-feet referred to in III(a), the Master considers this a mere "coincidence" and sees no correlation between the two (Rep. 188).

Article III(d) provides that the "States of the Upper Division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of ten consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification" of the Compact.

In our view, there is a clear and indeed necessary correlation between the "aggregate of 75,000,000 acre-feet" over a ten-year period, which is referred to in III(d), and the "7,500,000 acre-feet of water per annum", which is apportioned to the Lower Basin by III(a). Not only is this correlation suggested by the mathematics of multiplying 7,500,000 by ten, but it becomes even clearer when the purposes of the two clauses are considered.

Article III(d) requires the Upper Basin to let down to the Lower Basin an average of 7,500,000 acre-feet of water per annum. This is made a firm unconditional obligation on the Upper Basin—one which it must meet even though it may conceivably result in insufficient water to supply in full the quantity of water apportioned to the Upper Basin by Article III(a). One of two objectives may be ascribed to this required delivery of water: first, for use in the Lower Basin; second, for use in Mexico. The purpose could not

have been for use in Mexico, because any rights of Mexico are to be satisfied in accordance with the provisions of Article III(c), and the responsibility of the Upper Basin to deliver water for the Mexican Treaty obligation is "in addition to that provided in paragraph (d)". Therefore, the only purpose which can reasonably be ascribed to the requirement for the delivery of water imposed by subparagraph (d) is to guarantee to the Lower Basin a supply of water to meet the apportionment made to it by Article III(a) of the Compact (A Exc. 4).

Article III(d) was incorporated into the Compact to insure the Lower Basin that the apportionment made to it by Article III(a) would be satisfied out of main stream water originating in the Upper Basin and to assure that this apportionment would be met even during those periods when the water supply rising in the Upper Basin was insufficient to fulfill the total apportionment made to both basins by Article III(a).

In finding this position unacceptable, the Master held:

> "Since Article III(a) imposes a limit upon appropriation whereas III(d) deals with supply at Lee Ferry, an interpretation which makes these two provisions correlative one to another is inadmissible. . . . Moreover, III(a) extends to appropriations on Lower Basin tributaries as well as the mainstream. Such appropriations cannot possibly have any relation to the quantative measurement of the flow of water at Lee Ferry." (Rep. 144)

We respectfully suggest that two fallacies underly these conclusions: (1) that Article III(a) imposes a limit on appropriations and (2) that the limit extends to appropriations on Lower Basin tributaries as well as to appropriations on the main stream.

As we have seen, Article III(a) apportions main stream water only, not the water of tributaries. In holding that Article III(a) and (b) make an apportionment "by establishing a ceiling on the quantity of water which may be appropriated in each Basin as against the other" (Rep. 140) (footnote omitted), the Master is clearly in error. The Master's construction would attribute to the Upper Basin an intent to place a ceiling on economic development on the tributaries throughout the Lower Basin—obviously a matter of no concern to the Upper Basin. The Compact itself speaks of apportionment of water and not in terms of limitation on appropriation (see, *e.g.*, Articles I, III(a), (b), (f), (g), VIII).

We believe that Article III(a) makes an apportionment of water in perpetuity to each basin, regardless of the extent of appropriations in either basin of the water so apportioned. In fact, the concern of the Upper Basin was that the acquisition of prior appropriative rights in the Lower Basin might entitle Lower Basin users to enforce their prior claims against the Upper Basin. As a result, Article VIII of the Compact provides that the right to enforce Lower Basin appropriative rights against Upper Basin users shall cease when storage facilities on the main Colorado River have been provided in or for the benefit of the Lower Basin. By making an apportionment of water in perpetuity to each basin, the Compact insures that the future development of the Upper Basin shall be protected without interfering with the increased use of water in the Lower Basin and that each basin shall be left free to expand in an orderly manner without engaging in a race with the other.

It is Arizona's position that the terms of the Compact, when considered in relation to the conflict between the two

basins, the purposes which the framers sought to achieve and the geographical and physical facts confronting them, lead directly to the conclusion that Article III(a) apportions to the Lower Basin in perpetuity 7,500,000 acre-feet of water per annum from the main stream of the Colorado River at Lee Ferry and that tributary water is not included in this apportionment.

2. Interpretation of the phrase, "excess or surplus waters unapportioned" by the Compact

A. Article III(b) water is apportioned main stream water in the Compact sense.

Arizona contends, for the same reasons advanced in regard to Article III(a) of the Compact (see pp. 67-80, *supra*), that the 1,000,000 acre-feet of water referred to in Article III(b) is main stream water only. That is to say, both III(a) and (b) deal with the same water—water of the main stream (A Exc. 1, 2).

The Special Master gives Article III(b) of the Compact a construction similar to his interpretation of Article III(a), *i.e.*, as referring to water in the Colorado River *System*, main stream and tributaries (Rep. 194-200).

The Master concurs, however, in Arizona's position that both Article III(a) and (b) make an apportionment and that the water dealt with in III(b) is apportioned water. This, he agrees, is made manifest by Article III(f), which provides for "further equitable apportionment of the beneficial uses of the waters of the Colorado River System unapportioned by paragraphs (a), (b), and (c)" of Article III (Rep. 150).

B. Section 4(a) of the Project Act treats Article III(b) water as "surplus".

Although Article III(b) water is thus "apportioned" for Compact purposes, the Master holds that this fact does not control the interpretation of §4(a) of the Project Act (Rep. 150-51).

In construing the Act, the Master finds that the Article III(b) uses of water are "apportioned" for Compact purposes only and not "apportioned" for purposes of §4(a). Accordingly, he concludes that the phrase "excess or surplus waters unapportioned by said compact", as employed in §4(a), does not exclude the water referred to in Article III(b) of the Compact and includes all water above the first 7.5 million acre-feet available from the main stream in the Lower Basin in the United States in any one year (Rep. 194-200).

Before the Special Master, Arizona argued that Congress properly regarded the water dealt with by Article III(b) as water "apportioned" by the Compact and that, when Congress by §4(a), divided "excess or surplus waters unapportioned by said compact" equally between Arizona and California, it did not intend to include in the surplus "unapportioned" waters the water which had been apportioned by Article III(b); hence that §4(a) of the Project Act excluded California from the consumptive use of Article III(b) water. However, after further reflection, we are persuaded by the Special Master's reasoning that Arizona's original position is untenable (see Rep. 194-200).

Therefore we now concede that the phrase, "excess or surplus waters unapportioned by said compact", as used in §4(a), includes consumptive use of all main stream water above the first 7.5 million acre-feet available for use by the Lower Basin states in any one year.

III

The Project Act established a formula which governs the apportionment of main stream water among Arizona, California and Nevada and to which the water delivery contracts made by the Secretary of the Interior are required to conform.

A. The Formula Established by §4(a)

In §4(a) of the Project Act, as we have seen, Congress authorized what it considered to be a fair and equitable apportionment of main stream water among the Lower Basin states. On that basis, it undertook a settlement of the long-standing Arizona-California dispute regarding the division of main stream water available in the Lower Basin.

By §4(a), Congress made an overall allocation of the entire quantity of main stream water dealt with therein by establishing a formula under which the first 7.5 million acre-feet of that water should be divided in an amount not to exceed 4.4 to California, 2.8 to Arizona and .3 to Nevada and the surplus above 7.5 million to California and Arizona equally (Rep. 174).

In addition to requiring California to limit its claims, §4(a) gave the states of the Lower Basin advance congressional approval of an interstate compact which would adopt the apportionment of water thus authorized. But the Project Act did more. Section 4(a) established a formula for the division of water among the Lower Basin states which, by virtue of §5 (Appendix B, pp. 14a-15a), the Secretary of the Interior was required to follow in contracting for delivery of water from Lake Mead for use within those states, unless a different division of the water should be agreed upon by compact between the states as provided by §8(b)

(Appendix B, p. 20a). Although no interstate compact such as that contemplated by the Act was ever made, the apportionment of water approved by Congress in §4(a) nevertheless became an effective statutory apportionment by operation of §5.

B. The Requirement of §5 That Water Delivery Contracts Conform to the Formula

Section 5 provides in part that:

> "No person shall have or be entitled to have the use for any purpose of the water stored . . . [in Lake Mead] except by contract made as herein stated."

Also:

> "That the Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses . . . ."

Further:

> "Contracts respecting water for irrigation and domestic uses shall be for permanent service and *shall conform to paragraph (a) of section 4 of this Act*. . . ."

In thus requiring that water delivery contracts conform to §4(a), Congress prescribed specific standards which the Secretary was to follow—the formula for the apportionment of water approved by Congress in §4(a).

This conclusion is supported further by the following provisions of §8(b):

> "(b) Also the United States, in constructing, managing, and operating the dam, reservoir, canals, and

> other works herein authorized, including the appropriation, delivery and use of water . . . shall observe and be subject to and controlled, anything to the contrary herein notwithstanding, by the terms of such compact, if any, between the States of Arizona, California and Nevada, or any two thereof, for the equitable division of the benefits, including power, arising from the use of water accruing to said States, subsidiary to and consistent with said Colorado River compact, which may be negotiated and approved by said States and to which Congress shall give its consent and approval on or before January 1, 1929; and the terms of any such compact concluded between said States and approved and consented to by Congress after said date: *Provided, That in the latter case such compact shall be subject to all contracts, if any, made by the Secretary of the Interior under section 5 hereof prior to the date of such approval and consent by Congress.*"

By virtue of these provisions the states of the Lower Basin were left free to adopt, subject to congressional approval, a different apportionment if the formula set forth in §4(a) was not satisfactory to them. However, any such compact entered into and approved by Congress after January 1, 1929 was to be subject to all prior water contracts made by the Secretary of the Interior under §5 of the Act (Rep. 151).

Congress, therefore, must be held to have anticipated that there might be delay in the consummation of such a compact. Equally, Congress must have anticipated that there might be delay in the acceptance of the compact approved in advance by Congress in §4(a). Significantly, Congress made no provision in §4(a), similar to that found in §8(b), to preserve rights accruing under contracts

with the Secretary entered into prior to the making of the interstate compact authorized and approved by §4(a). The only reasonable explanation for this omission is that Congress had specified by §5 that the Secretary's contracts must conform to the allocation of §4(a) and that the Secretary was therefore without authority to deviate from the apportionment approved by §4(a). Thus there could be no conflict between the Secretary's contracts and that apportionment and hence no occasion to make provision governing rights in the event of such a conflict.

Since the Lower Basin states have not entered into any interstate compact as contemplated by §8(b), all contracts of the Secretary for delivery of water from Lake Mead must conform to paragraph (a) of §4—*i.e.*, must comply with the formula for the division of water prescribed by §4(a).

The Special Master, on the basis of an analysis of §§1, 5, 6 and 8 of the Project Act and a review of the purposes and legislative history of the Act, reached the conclusion that it was designed to establish the authority for the Secretary of the Interior to make an allocation by his water delivery contracts of all available water in Lake Mead and in the main stream downstream from Lake Mead among Arizona, California and Nevada (Rep. 151-64).

He found that §§4(a) and 8(b) of the Project Act authorized a division of water among the interested states by an interstate compact, but that in the absence of such an agreement "Congress clearly intended that the limitation on California in Section 4(a) and the Secretary's water delivery contracts made pursuant to Section 5 would impose a federal apportionment on the states" (Rep. 154).

This "federal apportionment" is also referred to in the Report as "a formula for the apportionment of mainstream

water among the three states of the Lower Basin with geographic access to the Colorado River; namely, Arizona, California and Nevada" (Rep. 99) (footnote omitted) and as "a flexible formula authorized by Congress and effectuated by the Secretary of the Interior. . . ." (Rep. 100)

However, the Special Master has refused to accept Arizona's view that the statutory apportionment thus established constitutes a mandatory "formula for the allocation [of water] which the Secretary is required precisely to follow" in making contracts for the delivery of water (A Exc. 7). The Master regards §§4(a) and 5 as requiring "substantial", not precise, compliance by the Secretary with the apportionment approved by Congress and he concludes that those sections give the Secretary "discretion" to make "contracts which apportion the water available in Lake Mead substantially along the lines which Congress proposed in Section 4(a) of the Project Act as a fair and equitable division among Arizona, California and Nevada" (Rep. 162).

In rejecting Arizona's argument that the second paragraph of §4(a) establishes a mandatory apportionment to which the Secretary's contracts must conform, the Master states that this paragraph

> " . . . merely *authorizes* a tri-state compact for the division of water; it does not compel it; nor does it condition approval of the Colorado River Compact upon acceptance of the proposed tri-state compact. . . . The suggested compact which Congress was willing to approve in advance is of no compelling force or effect since no such compact has ever been agreed to. In so far as Section 5 refers to the second paragraph of Section 4(a) it is for the purpose of requiring the Secretary to respect the compact if ratified by the states. See also Section 8(b).

Arizona's contention in this respect must therefore be rejected." (Rep. 163) (Master's italics)

We believe this construction of the second paragraph of §4(a) and of §§5 and 8(b) is erroneous (A Exc. 7). So interpreted, these sections would require the Secretary's water delivery contracts to "respect" only the compact, if any, made by the Lower Basin states for the division of water among them. It must follow that, since no such compact exists, there is no standard which the Secretary is required to "respect" or to follow in contracting for the delivery of Lake Mead water. Certainly, this result was not contemplated by Congress. Section 8(b) fixed January 1, 1929 as the deadline for an apportionment of water by a compact between Arizona, California and Nevada, or any two thereof, which, when consented to by Congress, would control all contracts for water delivery made by the Secretary. Section 8(b) also authorized such a compact to be concluded subsequent to January 1, 1929, but that compact was to be "subject to all contracts, if any, made by the Secretary of the Interior under section 5 . . . prior to the date of such approval and consent by Congress". If no compact whatever was made by the Lower Basin states, either pursuant to §§4(a) or 8(b), "Congress clearly intended", as the Master holds, "that the limitation on California in Section 4(a) and the Secretary's water delivery contracts made pursuant to Section 5 would impose a federal apportionment on the states" (Rep. 154).

If §4(a) does not establish a formula governing the Secretary's water contracts, then the authority given him by §5 to make those contracts "under such general regulations as he may prescribe" may well constitute an unconstitutional delegation of legislative functions to an admin-

istrative officer. Regulations made by executive officers are valid only insofar as they are subordinate to a legislative policy adequately defined by statute and when found to be within the framework of the policy so defined. See *Kent* v. *Dulles*, 357 U. S. 116, 129 (1958); *A. L. A. Schechter Poultry Corp.* v. *United States*, 295 U. S. 495, 529, 542 (1935); *Panama Refining Co.* v. *Ryan*, 293 U. S. 388, 421-30 (1935) and authorities there reviewed; *Lichter* v. *United States*, 334 U. S. 742, 785 (1948); *Bowles* v. *Willingham*, 321 U. S. 503 (1944); *Yakus* v. *United States*, 321 U. S. 414 (1944).

Section 4(a) expresses the congressional policy for division among the Lower Basin states of the water apportioned to that basin by Article III(a) of the Compact and of the excess or surplus water unapportioned by the Compact. Unless the provisions of §4(a) govern and control the Secretary's water contracts, there is no sufficient frame of legislative policy to which his regulations and the contracts made pursuant thereto can be referred.

Since the Court will not so construe an act of Congress as to render it unconstitutional unless no other construction is reasonably possible, §4(a) should be interpreted as fixing the criteria for the division of water which the Secretary must follow in contracting with Lower Basin states.

The Special Master has found that the Act imposes substantial and sufficient limitations on the Secretary's discretion (Rep. 161). For example, he found that the Secretary may not contract with California for more than 4,400,000 acre-feet out of 7,500,000 acre-feet of main stream water plus not more than one-half the surplus. This does not require the Secretary to contract with California for 4,400,000 acre-feet or for any amount, nor does it provide

standards to guide him in the disposition of water not contracted for with California.

Section 5 contains detailed specifications governing the Secretary's contracts for electrical energy and its generation. In fact, all of §5, except the first two unlettered paragraphs, deals solely with contracts for the sale and delivery of electrical energy. Congress, we submit, would hardly have regulated the Secretary's contracts for allocation of electrical energy in such detail and yet have granted him broad discretionary power with respect to the allocation of water—the subject of a bitter controversy which had prevented ratification of the Compact by Arizona and had blocked passage of the Swing-Johnson bills in three previous Congresses. Moreover, when Congress intended to clothe the Secretary with discretion, it did so in plain terms (see, *e.g.*, §7). It is only reasonable to conclude therefore that Congress considered it had effectively provided in the Project Act for an apportionment of water binding on the Secretary.

The fact that Congress intended to divide main stream water among Arizona, California and Nevada is further established by reference to the legislative history of the Project Act. Throughout the debate in the Senate, the Senators who were primarily interested in finding a solution to the Arizona-California controversy repeatedly referred to the fact that the bill would apportion water among the states and was designed to settle the dispute.

For example, on December 6, 1928, Senator Hayden of Arizona proposed an amendment to §4(a) which would have required California to limit itself to 4,200,000 acre-feet per annum and to agree to a tri-state compact allocating 300,000 acre-feet to Nevada and 3,000,000 acre-feet to

Arizona.[38] This proposal was the subject of a large part of the debate which followed. Senator Hayden, in explaining his amendment, said:

> "The State of Arizona is, therefore, interested in an apportionment of the waters of the lower basin. That is what the amendment which I have offered proposes to do."[39]

Senator Johnson of California also recognized that the Hayden amendment, which formed the basis for §4(a) as enacted, was intended to make an allocation of water among the three states:

> "Mr. Johnson. . . . I did not understand the Senator from Arizona in his speech of yesterday to say that a division of water alone would lead to a composition of the differences which exist. I understood him yesterday to insist not alone upon a division of water, as he suggests now, but, as well, to rest upon a substantial prohibition in this bill of the erection by the United States Government of a generating plant at Boulder Dam. . . .
>
> • • • • • •
>
> "Mr. Johnson. . . . Let me say, then, to the Senator from New Mexico [Mr. Bratton], that there are two conditions annexed here: First, Arizona says, 'You must divide the water in accordance with what has been suggested.'
>
> • • • • • •
>
> "Mr. Bratton. Let us separate the two things for the moment and discuss only the division of water.
>
> • • • • • •

[38] 70 Cong. Rec. 162 (1928), Ariz. Legis. Hist. 27-29.
[39] 70 Cong. Rec. 163 (1928), Ariz. Legis. Hist. 29.

"Mr. Bratton. Discussing the subject of water separate and apart from all other features of the bill, there seems to be a difference of 400,000 acre-feet between Arizona and California.

"Mr. Johnson. So there seems.

"Mr. Bratton. Without taking sides either way, we in the upper-basin States desire to adjust the whole matter satisfactorily to all of the States concerned. Any other attitude would be unbecoming a State.

"Mr. Johnson. I am sure that is the attitude of the gentlemen who confront me here.

"Mr. Bratton. . . . [A] difference of 400,000 acre-feet should not be permitted to defeat the entire proposal. . . . I want to join with the Senator from Utah (Mr. King) in saying that it is the earnest desire of the upper-basin States to aid the lower-basin States in adjusting and composing these differences and passing this legislation in a form that will be reasonably satisfactory to the two States and the other five as well.

"Mr. Johnson. I am sure that is so."[40]

At one point in the debate, Senator King of Utah suggested that a suit in equity to determine the conflicting rights should be required as a condition precedent to any construction under the Act. Senator Hayden replied:

". . . The only thing required in this bill is contained in the amendment that I have offered, that there shall be apportioned to each State its share of water. Then, who shall obtain that water in relative order of priority may be determined by the State courts."[41]

---

[40] 70 Cong. Rec. 165-66 (1928), Ariz. Legis. Hist. 31-34.

[41] 70 Cong. Rec. 169 (1928), Ariz. Legis. Hist. 45.

Senator Pittman of Nevada also recognized the necessity for a congressional division among Arizona, California and Nevada of the main stream water available to the Lower Basin, as follows:

> "Arizona, as I understand, will ratify the agreement whenever there shall be a provision in the bill or a separate agreement between Nevada and Arizona and California dividing the water let down to the three lower States. Of the 7,500,000 acre-feet of water let down that river they have gotten together within 400,000 acre-feet. They have got to get together, and if they do not get together Congress should bring them together."[42]

On December 8, 1928, Senator Bratton had printed an amendment to §4(a) requiring California to limit herself to 4,400,000 acre-feet plus one-half the surplus. In explaining his proposal, he stated:

> "As I understand, California holds to the belief that 4,600,000 acre-feet is an irreducible minimum. Arizona contends that a maximum of 4,200,000 acre-feet is the largest that she will consider. Personally, I am not wedded to either figure. The thing that is uppermost in my mind is to do equity and justice as nearly as can be done toward both States, and, at the same time, pass a bill that will be effectuated, and will secure the results which we all desire.
>
> "I think we should adopt that course. The two States have exchanged views, they have negotiated, they have endeavored to reach an agreement, and until now have been unable to do so. This controversy does not affect those two States alone. It affects other States in the Union and the Government as well.

---

[42] 70 Cong. Rec. 232 (1928), Ariz. Legis. Hist. 67.

"Without undertaking to express my views either way upon the subject, I do think that if the two States are unable to agree upon a figure then that we, as a disinterested and friendly agency, should pass a bill which, according to our combined judgment, will justly and equitably settle the controversy. I suggested 4,400,000 acre-feet with that in view. I still hold to the belief that somewhere between the two figures we must fix the amount, and that this difference of 400,000 acre-feet should not be allowed to bar and preclude the passage of this important measure dealing with the enormous quantity of 15,000,000 acre-feet of water and involving seven States as well as the Government."[43]

* * * * * *

"Mr. President, it is perfectly obvious to all of us that we have an immense project here, respecting which the two States, California and Arizona, can not agree. The dispute has narrowed itself primarily to 400,000 acre-feet of water, California saying that 4,600,000 acre-feet is her irreducible minimum and Arizona insisting that California shall be limited to 4,200,000 acre-feet.

"If this legislation shall be effectuated, the dam constructed, and the river controlled, and the benefits designed to be accomplished by the measure given full fruition, these States must ratify the compact. In my judgment that will never be accomplished if we give to one all that she asks and deny to the other everything she seeks.

"It seems to me, therefore, Mr. President, that in justice to the two States, they having been unable to agree, we should tender our offices by dividing the difference and requiring California to limit herself in her act of ratification, irrevocably and uncondi-

[43] 70 Cong. Rec. 333 (1928), Ariz. Legis. Hist. 71.

tionally, to a maximum consumptive use of 4,400,000 acre-feet. That divides the difference and is the amount fixed in the amendment I have proposed. It differs from the proposal of the Senator from Colorado by reducing California's claim 200,000 acre-feet. It differs from the amendment of the Senator from Arizona by increasing California's consumptive use by 200,000 acre-feet.

"I believe this is an equitable solution of the problem. It may not be entirely satisfactory to either State, but in my judgment it is the best compromise that is available at this time."[44]

The Bratton amendment was adopted.[45]

After Senator Hayden had withdrawn his amendment to §4(a) for parliamentary reasons,[46] he reoffered his proposal which would require California to give advance approval to a tri-state compact and stated:

"Mr. President, an examination of the amendment offered by the Senator from Colorado (Mr. Phipps) will disclose that it proposes that the State of California shall agree with the United States, for the benefit of the States of Arizona and Nevada, that the aggregate annual consumptive use of water from the Colorado River by the State of California shall not exceed 4,400,000 acre-feet. Further, that the State of California may have one-half of any excess or surplus waters unapportioned by the Colorado River compact.

"The first part of my amendment is a mere corollary to the amendment offered by the Senator from Colorado. It provides that of the remainder of

[44] 70 Cong. Rec. 385 (1928), Ariz. Legis. Hist. 88-89.

[45] 70 Cong. Rec. 387 (1928), Ariz. Legis. Hist. 97.

[46] 70 Cong. Rec. 382 (1928), Ariz. Legis. Hist. 84.

the seven and one-half million acre-feet there shall be apportioned to the State of Nevada 300,000 acre-feet, and to the State of Arizona 2,800,000 acre-feet, which, combined with 4,400,000 acre-feet which the State of California will use, completely exhausts the seven and one-half million acre-feet apportioned in perpetuity to the lower basin.

"The second proposal in my amendment is that the State of Arizona may annually use one-half of the surplus or unapportioned water, which is likewise a corollary to the proposal made by the Senator from Colorado, which likewise disposes of the total quantity of surplus or unapportioned waters in the lower basin."[47]

Senator Pittman, in commenting on the Hayden amendment, said:

"The Senate has already determined upon the division of water between those States. How? It has been determined how much water California may use, and the rest of it is subject to use by Nevada and Arizona. Nevada has already admitted that it can use only an insignificant quantity, 300,000 acre-feet. That leaves the rest of it to Arizona. As the bill now stands it is just as much divided as if they had mentioned Arizona and Nevada and the amounts they are to get; but there is just one other phase of the matter. The amount that either one of those States is entitled to under this legislation may be reduced if at some future time it is agreed, by treaty or contract or otherwise, that a certain amount of this water should, in justice, be used in Mexico."[48]

[48] 70 Cong. Rec. 468 (1928), Ariz. Legis. Hist. 123.

And further:

> "As I understand this amendment, Arizona today has practically allocated to it 2,800,000 acre-feet of water in the main Colorado River."[49]

Senator Pittman then objected to the provision in the Hayden amendment which would require California to give advance approval to a tri-state compact. He stated that he felt it was improper to coerce one state into agreeing with another and that they should be given full freedom to compact. Senator Hayden then agreed to change the language of his proposal to make the tri-state compact provision permissive rather than mandatory.[50] Senator Pittman then went on to say:

> "Mr. President, this question has been here now for seven years. The seven States have been attempting to reach an agreement. Apparently the Senate of the United States is about to reach an agreement as to what ought to be done. The Senate has already stated exactly what it thinks about the water. That might have been an imposition on some States. Why do we not leave it to California to say how much water she shall take out of the river or leave it to Arizona to say how much water she shall take out of the river? It is because it happens to become a duty of the United States Senate to settle this matter, and that is the reason."[51]

These excerpts from the Senate debate on the Project Act demonstrate that the matter of principal concern was a division of water among Arizona, Nevada and California which would bring about ratification of the Colorado River

Compact by all the states. The Senate spent a large part of the time in working out what it considered to be a fair and equitable apportionment of the water and finally split the difference between the 4,600,000 acre-feet demanded by California and the 4,200,000 acre-feet conceded by Arizona. This resulted in the allocation of 4,400,000 acre-feet to California, 2,800,000 acre-feet to Arizona and 300,000 acre-feet to Nevada, with California and Arizona to share equally in the excess over 7,500,000 acre-feet.

Senator Johnson of California agreed to accept the Hayden amendment as long as it was understood that California was not being coerced into entering into a compact. In this connection, Senator Pittman observed:

> "We have already decided as to the division of the water, and we say that if the States wish they can enter into a subsidiary agreement confirming that."[52]

It is inconceivable that the Senate would have devoted so much time and effort to working out the precise quantities of water which should be allocated to each state if any member supposed for a moment that there was being delegated to the Secretary of the Interior the authority to determine this matter in his discretion through the water delivery contracts. The Senators all felt they were under an obligation to settle the long-standing dispute between Arizona and California by setting forth in the Project Act an allocation of water to which the contracts made by the Secretary were required by §5 to conform.

The provisions of §5, which require the Secretary's contracts to "conform to paragraph (a) of section 4 of this Act . . .", can relate only to the division of water set out in §4(a). The Secretary has no authority to vary the formula

---

[52] 70 Cong. Rec. 471 (1928), Ariz. Legis. Hist. 131.

thus established. His water contracts must conform precisely to this formula in the absence of a different apportionment by the states under the provisions of §8(b).

Accordingly, it is clear that the existing water delivery contracts made by the Secretary of the Interior, insofar as they do not comply with the statutory formula established by Congress, are without legal authority and void.

C. The Water Delivery Contracts

The Special Master recommends that existing water delivery contracts entered into by the Secretary of the Interior be upheld as valid and binding, with the exception of Article 7(d) of the Arizona contract (Appendix E, pp. 37a-38a), amended Article 5(a) of the Nevada contract (Appendix G, p. 56a), and a Special Use Contract between the United States and Arizona-Edison Company, Inc. (Rep. 201, 220-21, 237-47).

We agree with the finding that the articles of the Arizona and Nevada contracts referred to are invalid for the reasons assigned by the Special Master, namely: they are not for permanent service, they violate the direction of §18 of the Project Act (Appendix B, pp. 25a-26a) that state law shall govern intrastate water rights and priorities, they are inconsistent with the §4(a) limitation on California's use of main stream water and they defeat the main stream allocation by introducing tributary considerations into a main stream apportionment (Rep. 237-47). We contend that these contractual provisions are also invalid for the additional reasons discussed immediately below. Furthermore, for the reasons hereafter stated, we regard as erroneous the Master's finding that Article 7(b), (f), and (g) of the Arizona contract are valid (A Exc. 8).

(1) The Arizona Contract

In the Arizona water contract (Appendix E, pp. 35a-44a), the United States agrees to deliver to Arizona from Lake Mead "so much water as may be necessary for the beneficial consumptive use for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet" (Art. 7(a)). Article 7(b) of the contract also provides for delivery from Lake Mead storage of "one-half of any excess or surplus waters unapportioned by the . . . Compact." These quoted provisions comply with §4(a) of the Project Act.

However, Article 7(b) also provides that deliveries to Arizona of such unapportioned water shall be "less such excess or surplus water unapportioned by said compact as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said states as stated in subdivisions (f) and (g) of this Article". In subdivision (f) Arizona "recognizes the right" of the United States and Nevada to contract for annual beneficial consumptive use within Nevada for agricultural and domestic uses of one twenty-fifth "of any excess or surplus waters available in the Lower Basin and unapportioned by the Colorado River Compact . . . ." By subdivision (g) Arizona "recognizes the rights of New Mexico and Utah to equitable shares of the water apportioned by the Colorado River Compact to the Lower Basin and also water unapportioned by such compact . . . ."

This attempted contractual "recognition" of water rights in Nevada, New Mexico and Utah is a conspicuous departure from the formula prescribed by §4(a). If given effect, these provisions will result in a division of water among Lower Basin states to which Congress has not con-

sented and which it has not authorized. As such, the provisions referred to are beyond the authority of the Secretary of the Interior and are null and void.

The Arizona water contract does not conform to §4(a) in another important respect. It provides in Article 7:

> "(d) The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead. . . ."

These provisions, insofar as they provide for the reduction of the allocation of main stream water made to Arizona by the Project Act, are likewise beyond the authority conferred upon the Secretary by the Act and are of no legal effect.

However, even if the Project Act be viewed, as the Special Master construes it, as providing authority for the Secretary to contract for the apportionment of main stream water among the States of Arizona, California and Nevada, rather than as itself making such an apportionment by prescribing a formula to which the Secretary's water delivery contracts must precisely conform, the provisions of Article 7(b), (d), (f) and (g) of the Arizona water delivery contract are nevertheless invalid because they are contrary to the provisions of the Project Act.

The Special Master has found that Article 7(d) of the Arizona contract and Article 5(a) of the Nevada contract, which relieve the Secretary of his obligation to deliver main stream water to those states at or below Boulder Dam to the extent that consumptive uses in such states diminish the flow into Lake Mead, are invalid because they violate the Project Act requirement that "contracts respecting

water for irrigation and domestic use shall be for permanent service" and for the reason that they introduce tributary considerations into a main stream apportionment contrary to the provisions of the Project Act (Rep. 237-47).

The same reasoning which caused the Special Master to reject these provisions of Article 7(d) of the Arizona contract and Article 5(a) of the Nevada contract likewise establish the invalidity of those portions of Article 7(b), (f) and (g) of the Arizona contract to which we have previously objected.

Article 7(b) of the Arizona contract, after providing for the delivery to Arizona of one-half of the excess or surplus water unapportioned by the Colorado River Compact, authorizes the Secretary to subtract therefrom "such excess or surplus water unapportioned by said compact as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said states as stated in subdivisions (f) and (g) of this Article." Article 7(f) of the Arizona contract provides for the recognition by Arizona of the right of the United States and the State of Nevada to make a contract for the "use of 1/25 (one twenty-fifth) of any excess or surplus waters available in the Lower Basin and unapportioned by the Colorado River Compact, which waters are subject to further equitable apportionment after October 1, 1963, as provided in Article III(f) and Article III (g) of the Colorado River Compact."

These provisions purport to authorize a diminution of the quantity of water required to be delivered under the Arizona contract if and when the United States and the State of Nevada should contract as provided in this Article. They clearly provide for a contingency which leaves uncertain the extent of Arizona's rights under its water delivery contract and are "contrary to the command of

Section 5 that 'contracts respecting water for irrigation domestic uses shall be for permanent service . . . .' '' (Rep. 237). The intent of Congress in requiring water delivery contracts to be for permanent service is carefully analyzed in the Special Master's Report (Rep. 238-40). The reasoning of the Special Master which demonstrates that Article 7(d) of the Arizona contract frustrates that congressional intent likewise exposes the invalidity of these provisions of Article 7(b) and (f) of the Arizona contract.

We are not at all certain that we properly understand just what was intended by Article 7(g) of the Arizona contract when considered in conjunction with Article 7(b) of that contract. Article 7(g), considered alone, gives rise to no particular difficulty, but when read in conjunction with the related portions of Article 7(b) it appears to provide for the deduction from Arizona's one-half share of excess or surplus water such quantities as shall equal the equitable shares of New Mexico and Utah of (1) water apportioned by the Colorado River Compact to the Lower Basin and also (2) water unapportioned by the Compact.

Since neither New Mexico nor Utah has access to the main stream of the Colorado River in the Lower Basin, the uses of Colorado River System water in those states must be from tributaries of the main stream. Accordingly, if Article 7(b) and (g) of the Arizona contract be construed as providing for the reduction of Arizona's share of main stream water by reason of uses in New Mexico and Utah, or in either of those states, it obviously operates to ''defeat the mainstream allocation, otherwise completely provided for in the contracts, by introducing System, *i.e.*, tributary, considerations in a mainstream apportionment'' (Rep. 242). As the Special Master said with reference to Article

7(d) of the Arizona contract: "To enforce these provisions would distort the mainstream apportionment and leave some mainstream water undisposed of." (Rep. 242)

Moreover, the terms of Article 7(g), when construed in conjunction with Article 7(b), likewise generate uncertainty regarding Arizona's entitlement under its water delivery contract by providing for contingencies which make that entitlement subject to reduction. Hence these terms are contrary to the requirement of §5 of the Project Act that water delivery contracts shall be for permanent service.

(2) The Nevada Contracts

By its water contracts with Nevada (Appendices F, G, pp. 45a-58a) the United States agrees to deliver from Lake Mead storage to Nevada "so much water, including all other waters diverted for use within the State of Nevada from the Colorado River system, as may be necessary to supply the State a total quantity not to exceed Three Hundred Thousand (300,000) acre-feet each calendar year" (amended Art. 5 (a), Appendix G, p. 56a).

The formula of §4(a) of the Project Act entitles Nevada to contract for delivery from Lake Mead storage for use in Nevada of 300,000 acre-feet of water per annum. Under §5(a) of Nevada's contracts, however, there are included in the 300,000 acre-feet of water to be delivered to Nevada "all other waters diverted for use within . . . Nevada from the Colorado River system," *i.e.*, water from Lower Basin tributaries in Nevada. In addition to the reasons assigned by the Special Master for the invalidity of these provisions, they do not conform to the §4(a) formula and hence are beyond the authority of the Secretary of the Interior and are of no legal efficacy.

(3) The California Contracts

We agree with the Special Master that, to the extent the delivery requirement of 5,362,000 acre-feet under the California contracts exceeds 4,400,000 acre-feet, the overage of 962,000 acre-feet may not properly be satisfied except out of California's share of excess or surplus water (Rep. 208).

We further agree that, in the event there is in any year less than 7,500,000 acre-feet of main stream water available for use by Arizona, California and Nevada, California's entitlement under its contract is 4.4/7.5 of the quantity available (Rep. 306).

D. Meaning and Measurement of "Consumptive Use"

Arizona agrees with the Master's conclusion that the §4(a) apportionment, including the California limitation, is to be measured in terms of consumptive use of water, defined as diversions from the river less return flow (Rep. 182-225).

We also concur with the Master's holding that the delivery obligations under the Secretary of the Interior's water delivery contracts are to be measured, as provided in those contracts, at the points of diversion (Rep. 186). Accordingly, Arizona takes no exception to the Master's conclusion that:

> "Consumptive use is to be measured by diversions at each diversion point on the mainstream less returns to the mainstream, measured or estimated by appropriate engineering methods, available for use in the United States or in satisfaction of the Mexican treaty obligation." (Rep. 186-87; and see Rep. 225)

In this connection, the Master has directed that each user of water shall be charged only for the amount of water actually diverted and which does not return to the main

stream and that losses of water which occur before diversion are a diminution of available supply under §4(a) and are not a consumptive use (Rep. 187).

Arizona suggests, however, that terms be incorporated in the final decree providing that ordered but unused water shall be charged to the party ordering it (A Exc. 38). The record establishes that frequently in the past water released from Hoover Dam on order was not used by the ordering party with the result that it flowed downstream to Mexico, although it was not and could not be credited to satisfaction of the Mexican Treaty obligation (Tr. 863-67, 974-75, 21143-76). Arizona submitted to the Master provisions for inclusion in his Recommended Decree which were designed to correct this situation and discourage improvident practices. Exception has been filed to the Master's failure to accept this proposal (A Exc. 38). The Court is respectfully requested to make appropriate remedial provisions in its decree.

E. Release From Storage of Apportioned But Unused Water

Arizona has excepted (A Exc. 33) to the provisions of Article II(B)(8) of the Special Master's Recommended Decree, which are as follows:

> "If, in any one year, water apportioned for consumptive use in a state will not be consumed in that state, whether for the reason that delivery contracts for the full amount of the state's apportionment are not in effect or that users cannot apply all of such water to beneficial uses, or for any other reason, nothing in this decree shall be construed as prohibiting the Secretary of the Interior from releasing such apportioned but unused water during such year for consumptive use in the other states. No rights to the recurrent use of such water shall accrue by reason of the use thereof . . . ."

The above quoted language, in providing that water apportioned to but not consumed by one state in any year may be delivered to the other states, contains no limitation that the aggregate of such water and the water apportioned to such other states shall be either within the contract entitlements of these states or within the limitation specified by the Project Act and the Limitation Act. Insofar as these provisions of the Recommended Decree vest in the Secretary of the Interior the discretion to deliver water in excess of the quantities specified by the Project and Limitation Acts or in excess of the amounts provided in the water delivery contracts of the Secretary of the Interior, they are clearly in violation of both the Project Act and the Limitation Act.

The fact that one state may not require or be in a position to utilize its full share of Colorado River water in any one year cannot operate to nullify the command of the Project Act that "the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California . . . shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact" (§4(a)). Nor does that fact sanction the delivery of water not contracted for, in violation of the provisions of the Project Act, that "no person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated" (§5).

We recognize that if one of the Lower Basin main stream states does not call for its full entitlement of stored water in any one year, it is only fair to allow this uncalled for water to be used to augment deliveries of water to other states up to their full entitlement under the Project and

Limitation Acts and their water delivery contracts with the Secretary of the Interior. However, to the extent that the delivery of such water would exceed the amounts permitted by the Project and Limitation Acts or the water delivery contracts, it is likewise proper and fair that such quantities of uncalled for water be retained in storage to increase the supply available for apportionment among the Lower Basin main stream states in the succeeding year or years.

Accordingly, Arizona proposes that the following be substituted for Article II(B)(8) in the Special Master's Recommended Decree:

> "(8) If, in any one year, main stream water apportioned for consumptive use in a state will not be ~~consumed~~ diverted for use in that state, ~~whether for the reason that delivery contracts for the full amount of the state's apportionment are not in effect or that users cannot apply all of such water to beneficial uses, or for any other reason,~~ nothing in this decree shall be construed as prohibiting the Secretary of the Interior from releasing such apportioned but unused water during such year for consumptive use in the other states; provided, however, that nothing herein contained shall be construed as authorizing the diversion or use of water without a contract with the Secretary of the Interior as required by the Boulder Canyon Project Act or in excess of the amounts permitted by said Act, the California Limitation Act and contracts made by the Secretary of the Interior for the delivery of water pursuant to Section 5 of the Boulder Canyon Project Act. No rights to the recurrent use of such water shall accrue by reason of the use thereof. . . ."[53]

---

[53] Deletions from the Recommended Decree have been lined out; additions have been underlined.

PART II

The Claims of the United States to Water

PART II

The Claims of the United States to Water

QUESTIONS PRESENTED

7. Whether, after the admission to statehood of Arizona, California and Nevada, the United States had the power to reserve water of the Colorado River, a navigable stream, for use by federal establishments within those states.

8. Whether, prior to the admission of Arizona to statehood, a reservation of water of the Colorado River for use on Indian Reservations within the Territory of Arizona could be made, without a clear manifestation of an intent to reserve such water; and as a subsidiary question:

A. Whether there was a clear manifestation of an intent to reserve water of the Colorado River for use on Indian Reservations within the Territory of Arizona.

9. Whether the power to reserve water for federal purposes resides exclusively in Congress or whether it may also be exercised by the President without authorization by Congress.

10. Whether, assuming a reservation of water for use on Indian Reservations has been made, the quantity of water reserved should be measured by the water needed to irrigate all the potentially irrigable acreage within each Reservation or by the needs of the Indians.

11. Whether, regardless of the existence or absence of a reservation of water for use on Indian Reservations, the

extent of Indian water rights should be determined by the application of equitable principles.

12. Whether, in withdrawing land for the Gila National Forest, the United States reserved water from the Gila and San Francisco Rivers in quantities reasonably necessary to fulfill the purposes of the forest.

STATEMENT OF THE CASE

I. Claims of the United States to Main Stream Water

A. Indian Reservations

Of the five Indian Reservations for which the Master has found there was a withdrawal of main stream water (Rep. 260), three are situated wholly or in part in Arizona: Colorado River, Fort Mohave and Cocopah.

Colorado River Indian Reservation

This Reservation is situated on both sides of the Colorado River in Arizona and California in arid desert valley country. The inhabitants of the Reservation, the Colorado River Indian tribes, have an agricultural economy. The Master estimates that 1,100 or 1,200 of the 1957 tribal population of approximately 1,300 live on the Reservation (Rep. 86).

Water for irrigation of the Arizona portion is diverted from the Colorado River at the northern part of the Reservation by a diversion dam called Headgate Rock Dam.

In 1864, the Commissioner of Indian Affairs recommended to the Secretary of the Interior the abandonment of the system of small Indian Reservations scattered throughout the West and the adoption of a system of large Reservations sufficiently extensive to furnish homes and

means of support for all the Indians of the West (U. S. 512, p. 21).

In this connection he proposed the creation of a Reservation along the Colorado River in Arizona consisting of 75,000 acres, the plan for which had evolved at a meeting between the Superintendent of Indian Affairs and the chiefs of the Yumas, Mohaves, Yavapais, Hualapais and Chemehuevis. The combined population of these tribes was considered to be about 10,000 (U. S. 512, p. 21; U. S. 513, p. 156).

On March 2, 1865 this suggestion was considered by Congress (U. S. 502, p. 1320) and on the following day the Colorado River Indian Reservation was created by Act of March 3, 1865, 13 Stat. 541, 559 (U. S. 501). Between 1865 and 1876, the Colorado River Reservation was enlarged by executive order from 75,000 acres to about 260,000 acres.

The Special Master has concluded that for the benefit of the Colorado River Reservation the United States has the right to the annual diversion of a maximum of 717,148 acre-feet of water from the main stream or to the quantity of main stream water necessary to supply the consumptive use required for the irrigation of 107,588 acres and for satisfaction of related uses, whichever is less, with various priority dates (Rep. 273-74). This conclusion is based upon the Master's finding that the United States is entitled to sufficient water to irrigate all the irrigable land in the Reservation (Rep. 265).

Fort Mohave Indian Reservation

This Reservation is situated in the States of Arizona, California and Nevada in the general area of their common borders. Embracing approximately 38,000 acres, the Reservation's climate and topography are characteristic of an arid desert valley (Rep. 85).

On August 4, 1870, the War Department by general order set aside two tracts of land containing 14,696.81 acres, more or less, for military purposes. The first of these was called Camp Mohave and contained 5,582 acres, more or less. The second was called Camp Mohave Hay and Wood Reservation and contained 9,114.81 acres, more or less (U. S. 1301).

The Acting Secretary of War recommended, on September 18, 1890, that the "military reservation of Fort Mohave, Arizona, be transferred and turned over to the Department of the Interior for Indian School purposes under the Act of July 31, 1882, entitled 'an Act to provide additional Industrial Training Schools for Indian youth and authorizing the use of unoccupied military barracks for such purposes' ". This recommendation was approved by the President on September 19, 1890 (U. S. 1302, 1303).

On March 18, 1903, an administrative ruling held that "all that intermediate tract of land between the military and the hay and wood reservation bounded on the west by the Colorado River and on the east by a line running from Station No. 1 of the hay and wood reservation to Station No. 1 of the military reservation, was included in the tract reserved for Indian school purposes" (U. S. 1301).

By executive order dated December 1, 1910 the President directed that additional lands "not included within the present boundaries of the Fort Mohave Indian Reservation . . . be, and the same are hereby, withdrawn from settlement and entry and set apart as an addition to the present Fort Mohave Indian Reservation in Arizona, for the use and occupation of the Fort Mohave and such other Indians as the Secretary of the Interior may see fit to settle thereon . . . ." (U. S. 1304)

On February 2, 1911, the President cancelled the executive order of December 1, 1910, but again set apart addi-

tional lands for the identical purposes specified in the 1910 order (U. S. 1305).

The Special Master has found that there are 18,974 irrigable acres in the Fort Mohave Reservation and has concluded that for the benefit of the Reservation the United States has the right to the annual diversion of 122,648 acre-feet of water from the Colorado River or to the quantity of main stream water necessary to supply the consumptive use required for irrigation of such irrigable land and related uses, whichever is less, with priority dates of September 18, 1890, for lands transferred by the executive order of that date and of February 2, 1911, for land reserved by the executive order of that date (Rep. 282-83).

Cocopah Indian Reservation

This Reservation was established by an executive order of September 27, 1917 (Rep. 267)—after Arizona had been admitted to statehood.

The Reservation is composed of two tracts located southwest of Yuma in Arizona. Colorado River water is delivered to the Reservation lands through facilities of the Yuma Reclamation Project (Rep. 268).

The Master has found that 431 of the approximately 500 acres comprising the area of the Reservation are irrigable (Rep. 88, 268), and on this basis he has concluded that for the benefit of this Reservation the United States has the right to the quantity of main stream water necessary to supply the consumptive use required by that number of acres and for the satisfaction of related uses or to the annual diversion of a maximum of 2,744 acre-feet of water from the Colorado River, whichever is less, with a priority date of September 27, 1917 (Rep. 268).

B. Recreation Areas and Wildlife Refuges

Lake Mead National Recreation Area

This area is located in Arizona and Nevada. It is the only establishment administered by the Bureau of Land Management currently diverting water from the main stream of the Colorado River in the Lower Basin (Rep. 294).

Executive orders dated May 3, 1929 (No. 5105) and April 25, 1930 (No. 5339) withdrew lands in Arizona and Nevada pending determination as to the advisability of including such lands in a national monument. In 1936, Congress appropriated funds for the operation of the Boulder Canyon Project Area which included these lands.

Although the Master found that there is not sufficient evidence to make a determination of the ultimate water requirements of this recreation area, he nevertheless concluded that the United States has the right to divert main stream water in quantities reasonably necessary to fulfill the purposes of the area, with priority dates of May 3, 1929 and April 25, 1930 (Rep. 295).

Havasu Lake National Wildlife Refuge

An executive order of January 22, 1941 (No. 8647) established the Havasu Lake National Wildlife Refuge and set apart approximately 37,370 acres of land owned by the United States in Mohave and Yuma Counties, Arizona, and San Bernardino County, California, as a refuge and breeding ground for migratory birds and other wildlife (Rep. 298).

On February 11, 1949, the Assistant Secretary of the Interior by Public Land Order 559 added approximately 1,677 acres in Arizona and approximately 1,080 acres in California to the Havasu Lake National Wildlife Refuge.

The Master has found that in withdrawing these lands the United States intended to reserve rights to the use of enough Colorado River water to fulfill the purposes of the refuge and that annual diversion of 41,839 acre-feet and annual consumptive use of 37,339 acre-feet of Colorado River water will satisfy the estimated requirements of the refuge. He concluded that the United States has the right to either of these amounts, whichever is less, for use in the refuge, with priority dates of January 22, 1941 and February 11, 1949 (Rep. 299).

Imperial National Wildlife Refuge

An executive order of February 14, 1941 (No. 8685) established the Imperial National Wildlife Refuge and set apart approximately 51,090 acres of land owned by the United States in Yuma County, Arizona, and Imperial County, California, as a refuge and breeding ground for migratory birds and other wildlife (Rep. 299-300).

Here again, the Master has found that by withdrawal of these lands the United States intended to reserve rights to the use of so much main stream water as might be reasonably needed to fulfill the purposes of the refuge and he found also that annual diversions of 28,000 acre-feet and annual consumptive use of 23,000 acre-feet of Colorado River water will satisfy the estimated water requirement of the refuge in fulfillment of a development plan formulated for the refuge (Rep. 300). Accordingly, he concluded that the United States has the right to either the stated amount of diversion or of consumptive use, whichever is less, for use in the refuge, with a priority date of February 14, 1941 (Rep. 300).

II. Claims of the United States to Tributary Water

The Master has found that there is no justiciable controversy with respect to any of the tributaries in the Lower Basin except the Gila River System (Rep. 321-24).

Arizona agrees with the Special Master's disposition of the dispute between Arizona and New Mexico with respect to the allocation of the waters of the Gila River between these two states. Arizona disagrees, however, with the Master's resolution of the controversy between it and the United States with respect to the reservation of water for use in the Gila National Forest (Rep. 332-35) (A Exc. 29-30).

Gila National Forest

The Master found that the Gila National Forest was created as a public reservation by a presidential proclamation dated March 2, 1899 and was subsequently enlarged and modified (Rep. 342).

The Master also found that the United States intended, when it withdrew this forest from entry, to reserve the water necessary to fulfill the purposes for which the forest was created (Rep. 342). Accordingly, he has concluded that the United States has the right to divert water from the Gila and San Francisco Rivers in quantities reasonably necessary to fulfill the purposes of the Gila National Forest, with priority dates as of the date of withdrawal for forest purposes of each area of the forest within which the water is used (Rep. 343).

SUMMARY OF THE ARGUMENT

Arizona has filed exceptions to those parts of the Special Master's Report and Recommended Decree which sustained certain claims of the United States to main stream

water of the Colorado River for use on Indian Reservations and other federal establishments created out of public land in Arizona (A Exc. 10-28).

Relying basically on a single decision of this Court,[54] which involved the reservation of water of a non-navigable stream for use on an Indian Reservation created by treaty in the Territory of Montana, the Master has concluded that the federal government has the power to reserve water of both navigable and non-navigable streams for the benefit of all federal establishments, regardless of whether the reservation is made by treaty, statute or executive order. He also fails to recognize any distinction between the power of the United States to dispose of navigable water within a territory and its power to dispose of navigable water within a state.

In upholding claims of the United States on behalf of Indian tribes, the Special Master has conceived and applied the principle that the very establishment of an Indian Reservation impliedly reserves in perpetuity for use on the Reservation whatever quantity of water may be required in the indefinite future to irrigate every irrigable acre within the Reservation, without regard to the actual needs of the Indians on the Reservation. The resulting water rights are held to be of fixed magnitude and priority and appurtenant to defined lands, so that their use is not restricted to Indians but may be transferred to non-Indians (Rep. 254-66).

The questions regarding water rights of the United States for use in the Lake Mead National Recreation Area and in the Lake Havasu and Imperial Wildlife Refuges are similarly dealt with by application of the same principles invoked in the Special Master's treatment of Indian Reservations (Rep. 297-300).

---

[54] *Winters* v. *United States*, 207 U. S. 564 (1908).

The Master's Report does not examine into the source of the federal power to reserve water of a navigable stream for use on federal establishments. Rather the Master states that "it is unnecessary, for the purposes of this case, to explore the origin or limits of such power to reserve water against subsequent appropriators" (Rep. 259).[55]

The Special Master fails to recognize the distinction between the legal principles applicable to navigable waters and those which govern non-navigable streams. He fails to give effect to the well established rule that, when a state is admitted to the Union, dominion over its navigable water passes from the United States to the newly created state. Thereafter the federal government is without power to reserve the water of a navigable stream for use on federal establishments,[56] since its only authority over such water is that which is vested in it by the Commerce Clause and the treaty-making provisions of the Constitution.

Prior to statehood, the right of the United States in navigable water of a territory, unlike its title to territorial land, is not absolute but the right is held for the benefit of the people and in trust for the future state.

The power of the United States to reserve navigable water of a territory prior to statehood for use on federal establishments resides exclusively in Congress under the so-called "Public Property Clause" of the Constitution (art. IV, §3, cl. 2), which provides that "the Congress shall have the power to dispose of and make all needful Rules and Regulations respecting the Territory or other

---

[55] In fairness and candor we should advise the Court that neither the briefs nor oral arguments of the parties before the Special Master presented these considerations to him in any substantial degree.

[56] All federal establishments on the main stream of the Colorado River in Arizona, except the Colorado River and Fort Mohave Indian Reservations, were created after Arizona became a state.

Property belonging to the United States". No authority exists in the Executive Department of the federal government to dispose of navigable waters for federal purposes by executive order or otherwise in the absence of a definite and explicit delegation from Congress.

In any event, wherever the power to reserve these rights may be held to reside, it must be exercised in a manner clearly manifesting the intent to make a reservation of water. An inference that such rights were reserved *in navigable water* may not be drawn simply from the fact that an Indian Reservation is created in a generally arid region adjacent or proximate to a navigable stream.

The Colorado River Indian Reservation was created by Act of Congress and enlarged by executive orders. The Fort Mohave and Cocopah Indian Reservations were created and the former was enlarged by executive orders. None of these instruments can be construed to contain an express manifestation of intent to reserve water of the Colorado River for the benefit of the Indians or Indian lands. In fact, they contain no mention of water at all. Had the Master considered these documents in the light of the applicable legal principles, he would have found no such manifestation of intent as is required to reserve navigable water and would therefore have been obliged to conclude, contrary to his Report, that there had been no reservation of water.

Finally, even should it be held that water from the Colorado River was reserved by implication for the benefit of these Indian Reservations, the quantity of water reserved should be measured by the reasonably foreseeable needs of the Indians as shown by past experience rather than by the possible needs of the potentially irrigable acres. The holding of the Master permits the maximum use of water and leads to results which are inequitable and indeed, in some instances, unrealistic.

The Special Master has held that uses of water from the main stream of the Colorado River on federal establishments are chargeable to the entitlement of the state in which the use occurs (Rep. 247). Thus uses on the Colorado River, Fort Mohave and Cocopah Indian Reservations in Arizona are charged to Arizona's share of main stream Colorado River water, even though that state has no jurisdiction or control over such uses. Therefore, whether or not there has been a reservation of water for federal establishments, the question is presented as to what principles should be applied by this Court in order to determine, as between the United States on behalf of these Reservations and Arizona on behalf of other users within the state, rights to the use of Arizona's share of Colorado River water.

We suggest that the same general considerations which have led the Court to employ principles of equitable apportionment in the allocation of water between states, absent a statutory apportionment, are applicable here. While Indian tribes today do not have the status of a true sovereign, nevertheless the laws of the state are generally without force within the boundaries of Indian Reservations within the state. In addition, since Indians are wards of the federal government, a true sovereign, it is peculiarly appropriate that equitable principles should be applied in weighing the claims of the United States on their behalf against those of the State of Arizona on behalf of other users within the state.

The Special Master has found that there is not sufficient evidence to make a finding of the ultimate water requirements of the Gila National Forest (Rep. 342), but he finds that in withdrawing lands for the use of the forest the United States intended to reserve rights to the use of so much water from the Gila and San Francisco Rivers as might be reasonably needed to fulfill the purposes of the

forest (Rep. 342). He concludes that the United States has the right to divert water from the main stream of the Gila and San Francisco Rivers in quantities reasonably necessary to fulfill the purposes of the forest, with priority dates as of the date of withdrawal for forest purposes of each area of the forest within which the water is used (Rep. 343). He also states that private rights in the Gila River System recognized by the Recommended Decree are subordinate to the rights of the United States to divert water for the Gila National Forest to the extent that the private rights are junior in time (Rep. 335).

Although Arizona is not in agreement with the conclusion of the Special Master that the United States possesses the power to reserve water for use in the Gila National Forest, it is not necessary that that question be resolved in this litigation, since congressional legislation demonstrates that there was no intent to reserve water for national forests, but to the contrary that Congress intended the acquisition of rights to water for national forests to be governed by the laws of the state in which the forests are located.

ARGUMENT

IV

After Arizona was admitted to statehood, the United States had no power to reserve water of the main stream of the Colorado River for the use of federal establishments within Arizona.

This Court has consistently held that upon the admission of a territory to statehood, sovereign rights in the water and beds of navigable streams become vested in the newly created state, which acquires absolute and complete sover-

eignty over them, subject only to the power of the United States over navigation under the Commerce Clause. *Borax Consolidated, Ltd.* v. *Los Angeles,* 296 U. S. 10 (1935); *United States* v. *Utah,* 283 U. S. 64 (1931); *Massachusetts* v. *New York,* 271 U. S. 65 (1926); *Port of Seattle* v. *Oregon & W. R. R.,* 255 U. S. 56, 63 (1921); *United States* v. *Mission Rock Co.,* 189 U. S. 391 (1903); *United States* v. *Rio Grande Dam & Irrigation Co.,* 174 U. S. 690 (1899); *Knight* v. *United Land Ass'n,* 142 U. S. 161 (1891); *Goodtitle* v. *Kibbe,* 50 U. S. (9 How.) 471 (1850); *Pollard* v. *Hagan,* 44 U. S. (3 How.) 212 (1845); *Martin* v. *Waddell's Lessee,* 41 U. S. (16 Pet.) 367 (1842).

Thus in *Martin* v. *Waddell's Lessee* it was said regarding the original states:

> "For when the Revolution took place the people of each State became themselves sovereign; and in that character hold the absolute right to all their navigable waters and the soils under them for their own common use, subject only to the rights since surrendered by the Constitution to the general government." 41 U. S. (16 Pet.) at 410.

That the same absolute sovereignty over navigable waters exists in newly admitted states was held in *Knight* v. *United Land Ass'n,* 142 U. S. at 183:

> "It is the settled rule of law . . . that absolute property in, and dominion and sovereignty over, the soils under the tidewaters in the original states were reserved to the several states, and that the new states since admitted have the same rights, sovereignty, and jurisdiction. . . ."

In *United States* v. *Mission Rock Co.,* the Court quoted with approval the following excerpt from *Weber* v. *State Harbor Comm'rs,* 85 U. S. (18 Wall.) 57, 65-66 (1873), regarding California tidelands:

> "'Although the title to the soil under the tide-waters of the bay was acquired by the United States by cession from Mexico, equally with the title to the upland, they [the United States] held it only in trust for the future State. Upon the admission of California into the Union upon equal footing with the original States, absolute property in, and dominion and sovereignty over, all soils under the tide waters within her limits passed to the State, with the consequent right to dispose of the title to any part of said soils in such manner as she might deem proper, subject only to the paramount right of navigation over the waters, so far as such navigation might be required by the necessities of commerce with foreign nations or among the several states, the regulation of which was vested in the general government.'" 189 U. S. at 404.

Accordingly, it was held in *Port of Seattle* v. *Oregon & W. R. R.*, 255 U. S. at 63:

> "The right of the United States in the navigable waters within the several states is limited to the control thereof for purposes of navigation. Subject to that right Washington became, upon its organization as a state, the owner of the navigable waters within its boundaries and of the land under same. . . . The character of the state's ownership in the land and in the waters is the full proprietary right. The state, being the absolute owner of the tidelands and of the waters over them, is free, in conveying tidelands, either to grant with them rights in the adjoining water area, or to completely withhold all such rights."

After statehood, then, the United States has no power whatever to reserve for the use of federal establishments water of navigable streams, title to which has passed to and vested in the state upon its admission to the Union.

The Special Master does not sustain such power under the Commerce Clause and there is no support either in this record or in the law for the conclusion that the asserted reservation of water for federal establishments is an exercise of congressional power over navigation under the Commerce Clause.

Arizona was admitted to statehood on February 14, 1912. The Cocopah Indian Reservation was created September 27, 1917 (Rep. 267). The Lake Mead National Recreation Area was established by withdrawal of lands beginning May 3, 1929 (Rep. 294) and the Havasu Lake and Imperial National Wildlife Refuges were established January 22, 1941 and February 14, 1941, respectively (Rep. 298-300).

Since these federal establishments were all created after Arizona was admitted to statehood, the federal government was without power to make any reservation of water of the Colorado River, a navigable stream, for the use of these establishments within the state of Arizona and the Special Master is in error in holding that such water was reserved for use within these areas (A Exc. 15, 16, 23-28).

For these reasons, the Recommended Decree is erroneous and should not be adopted insofar as it provides for the delivery of water from Lake Mead for the benefit of the Cocopah Indian Reservation (Article II(C)(2)(b); Rep. 350), the Lake Mead National Recreation Area in Arizona and the Havasu Lake and Imperial National Wildlife Refuges (Article II(C)(f), (g) and (h); Rep. 352-53) (A Exc. 34).

V

No reservation of water of the main stream of the Colorado River has been made for the use of Indian Reservations in Arizona.

A. Power of the United States to Reserve Navigable Waters Before Statehood

Sovereign rights in the water and beds of navigable streams were examined and defined by Mr. Justice Gray in the leading case of *Shively* v. *Bowlby,* 152 U. S. 1, 57-58 (1894)[57]:

> "At common law, the title and the dominion in lands flowed by the tide were in the king for the benefit of the nation. Upon the settlement of the colonies, like rights passed to the grantees in the royal charters in trust for the communities to be established. Upon the American Revolution, these rights, charged with a like trust, were vested in the original states within their respective borders, subject to the rights surrendered by the Constitution to the United States.
>
> "Upon the acquisition of a territory by the United States, whether by cession from one of the states, or by treaty with a foreign country, or by discovery and settlement, the same title and dominion passed to the United States, for the benefit of the whole people, and in trust for the several States to be ultimately created out of the territory.
>
> "The new States admitted into the Union since the adoption of the Constitution have the same rights

[57] Referring to *Shively* v. *Bowlby,* this Court has said: "It is unnecessary, and it would be difficult, to add anything to the reasoning of that case." *United States* v. *Winans,* 198 U. S. 371, 383 (1905). Again, the Court has commented that the "whole subject has been clarified, after the fullest examination of all the authorities, in a most useful opinion by Mr. Justice Gray". *Brewer-Elliott Oil & Gas Co.* v. *United States,* 260 U. S. 77, 84 (1922).

as the original states in the tide waters, and in the lands under them, within their respective jurisdictions. The title and rights of riparian or littoral proprietors in the soil below high water mark, therefore, are governed by the laws of the several States, subject to the rights granted to the United States by the Constitution.

"The United States, while they hold the country as a territory, having all the powers both of national and of municipal government, may grant, for appropriate purposes, titles or rights in the soil below high water mark of tide waters. But they have never done so by general laws; and, unless in some case of international duty or public exigency, have acted upon the policy, as most in accordance with the interest of the people and with the object for which the territories were acquired, of leaving the administration and disposition of the sovereign rights in navigable waters, and in the soil under them, to the control of the states, respectively, when organized and admitted into the Union.

"Grants by Congress of portions of the public lands within a territory to settlers thereon, though bordering on or bounded by navigable waters, convey, of their own force, no title or right below high water mark, and do not impair the title and dominion of the future state when created; but leave the question of the use of the shores by the owners of uplands to the sovereign control of each state, subject only to the rights vested by the Constitution in the United States."

Thus, the right of the United States in navigable waters within federal territories, unlike its title to territorial lands, is not absolute, but is held by "the United States for the benefit of the whole people" and "in trust for" the future states. *Shively* v. *Bowlby,* 152 U. S. at 57.

It was once thought that this trusteeship prevented the United States from disposing of navigable streams or the beds thereof flowing within territories of the United States, even prior to their admission to statehood. *Pollard* v. *Hagan*, 44 U. S. (3 How.) 212 (1845).[58] However, the "dicta" to that effect in *Pollard* was limited in *Shively*, 152 U. S. at 28, 47, 48:

> "So much of the reasoning of the learned justice, as implied that the title in the land below high water mark could not have been granted away by the United States after the deed of cession of the territory and before the admission of the state into the Union, was not necessary to the decision, which involved only a grant made by Congress after the admission of Alabama, and which was followed in two similar cases in which Congress, after the admis-

---

[58] In *Pollard* v. *Hagan*, the Court had stated in part:

"We think a proper examination of this subject will show that the United States never held any municipal sovereignty, jurisdiction, or right of soil in and to the territory, of which Alabama or any of the new States were formed; except for temporary purposes, and to execute the trusts created by the acts of Virginia and Georgia Legislatures, and the deeds of cession executed by them to the United States, and the trust created by the Treaty with the French Republic, of the 30th of April, 1803, ceding Louisiana.

* * * * * *

"When the United States accepted the cession of the territory, they took upon themselves the trust to hold the municipal eminent domain for the new States, and to invest them with it, to the same extent, in all respects, that it was held by the States ceding the territories.

* * * * * *

"Alabama is therefore entitled to the sovereignty and jurisdiction over all the territory within her limits, subject to the common law, to the same extent that Georgia possessed it before she ceded it to the United States. To maintain any other doctrine, is to deny that Alabama has been admitted into the Union on an equal footing with the original States, the constitution, laws, and compact, to the contrary notwithstanding . . . ." 44 U. S. (3 How.) at 221, 222-23, 228-29.

sion of the state, had undertaken to confirm Spanish grants, made after the Treaty of San Ildefonso of 1800, and therefore passing no title whatever.

* * * * * *

"Notwithstanding the *dicta* contained in some of the opinions of this court, already quoted, to the effect that Congress has no power to grant any land below high water mark of navigable waters in a territory of the United States, it is evident that this is not strictly true.

* * * * * *

"We cannot doubt . . . that Congress has the power to make grants of lands below high water mark of navigable waters in any territory of the United States, whenever it becomes necessary to do so in order to perform international obligations, or to effect the improvement of such lands for the promotion and convenience of commerce with foreign nations and among the several States, or to carry out other public purposes appropriate to the objects for which the United States hold the territory."

In recognition of the duties of the United States as trustee of navigable waters within the territories for the benefit of future states, Congress long ago adopted a policy with regard to such waters (as distinguished from public lands), which was thus described in *Shively* v. *Bowlby,* 152 U. S. at 49-50:

"The Congress of the United States, in disposing of the public lands, has constantly acted upon the theory that those lands, whether in the interior, or on the coast, above high water mark, may be taken up by actual occupants, in order to encourage the settlement of the country; but that the navigable waters and the soils under them, whether within or above the ebb and flow of the tide, shall be and remain public

highways; and, being chiefly valuable for the public purposes of commerce, navigation and fishery, and for the improvements necessary to secure and promote those purposes, shall not be granted away during the period of territorial government; but, unless in case of some international duty or public exigency, shall be held by the United States in trust for the future states, and shall vest in the several states, when organized and admitted into the Union, with all the powers and prerogatives appertaining to the older states in regard to such waters and soils within their respective jurisdictions; in short, shall not be disposed of piecemeal to individuals as private property, but shall be held as a whole for the purpose of being ultimately administered and dealt with for the public benefit by the state, after it shall have become a completely organized community."[59]

This congressional policy of treating navigable waters within federal territories and the lands under them as being held for the benefit of future states has long since become firmly "established". *United States* v. *Holt State Bank*, 270 U. S. 49, 58 (1926).

B. Power of the Executive to Reserve Navigable Water

Since all of the Fort Mohave and Cocopah Indian Reservations and all of the Colorado River Indian Reservation, except the original 75,000 acres which were withdrawn by Congress in 1865 (pp. 110-11, *supra*), were set apart by executive order, there is squarely presented the question of the power of the executive branch of the government to reserve

[59] A more recent statement by this Court concerning the meaning and effect of the "equal footing" clause may cast doubt upon the validity of the limitations placed on the rule announced in the *Pollard* case by the decision in *Shively* v. *Bowlby* and subsequent cases. See *United States* v. *Texas*, 339 U. S. 707, 712-20 (1950).

navigable water of a territory for federal establishments.[60] The question has never been decided by this Court. It was not until the decision in *United States* v. *Midwest Oil Co.*, 236 U. S. 459 (1915), that the Court sustained the presidential power to withdraw by executive order public lands from private acquisition after they had been opened by Congress to occupation and purchase. The executive power with regard to public lands was sustained despite the constitutional provision which vests in *Congress* the "Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States" (art. 4, §3, cl. 2). The issue was decided "in the light of the legal consequences flowing from a long-continued practice", 236 U. S. at 469; and on the basis of the Court's finding that during the period of eighty years before its decision the President "without express statutory authority—but under the claim of power so to do—[had] made a multitude of Executive Orders which operated to withdraw public land that would otherwise have been open to private acquisition". 236 U. S. at 469. The Court found congressional acquiescence in this presidential usage "on the presumption that unauthorized acts would not have been allowed to be so often repeated as to crystallize into a regular practice". 236 U. S. at 472-73.

The power to reserve by executive order federally owned lands, title to which is in the United States as absolute owner, and the power to reserve navigable territorial water, which is held by the United States in trust for future states, are of course two entirely different things. We have found no statute which authorizes the President to reserve navigable water for the benefit of federal establishments

---

[60] The same question is also presented with respect to the Lake Mead National Recreation Area and Havasu Lake and Imperial National Wildlife Refuges, all of which were created and enlarged by executive orders.

nor, so far as we have been able to determine, are there any cases which have passed upon the existence of such executive power in the absence of statute.[61]

The question of the power of the Executive was raised but not decided in *Alaska Pacific Fisheries* v. *United States*, 248 U. S. 78 (1918). This Court ignored the executive order asserted as the source of the Indians' fishing rights there involved and sustained the reservation of the fishing rights as having been effected by the statute establishing the Indian Reservation.

Thirty years later, alluding to *Alaska Pacific Fisheries*, the Court noted in *Hynes* v. *Grimes Packing Co.*, 337 U. S. 86, 113-14 (1949):

> "This Court affirmed the decree as to the waters within 3,000 feet of the shore lines. Although in the brief a vigorous attack was made on the power to issue the proclamation covering the waters, the proclamation was not referred to in the unanimous opinion here. This Court felt compelled to decide the fisheries were included *in the language of the statute* by the purpose to assist the Indians to train themselves. Fishing was said to give value to the islands."

United States v. *Midwest Oil Co.*, 236 U. S. 459 (1915), is not a valid precedent for sustaining the existence of executive power to reserve navigable water. That decision, as we have seen, was based upon a delegation of power to set apart public lands, which was implied from long congressional acquiescence in the exercise of that particular power. Finding a similar assent and transfer of authority from Congress to the President is far more difficult, if not impos-

[61] The existence of the power in the Executive seems to have been questioned, at least impliedly, by Chief Justice Hughes in *United States* v. *Utah*, 283 U. S. 64, 88-89 (1931).

sible, with respect to the reservation of navigable water. In cases of land reserved by executive order, the acts of reservation were plain and well-known to Congress. With respect to the implied reservation of water rights by executive act, on the other hand, there can be no valid claim of congressional knowledge and acquiescence. That it was the intention to reserve water as well as land nowhere appears from any of the documents creating or enlarging the Reservations. Indeed, it was contrary to the policy of Congress itself to dispose of navigable waters so as to foreclose transfer of sovereignty over them to future states (pp. 125-29, *supra*). In the absence of knowledge or belief on the part of Congress that the Executive intended to reserve water with each withdrawal of land, it is impossible to infer that Congress acquiesced in or approved of such executive intent.

Hence, the inferred congressional delegation of power to the President which was found in *Midwest Oil* with respect to public lands cannot validly be relied upon to sustain the reservation of rights in navigable water by executive order or proclamation. As this Court stated in *Sioux Tribe* v. *United States*, 316 U. S. 317, 326 (1942):

> "Since the Constitution places the authority to dispose of public lands exclusively in Congress, the executive's power to convey any interest in these lands must be traced to Congressional delegation of its authority. The basis of decision in *United States* v. *Midwest Oil Co.* was that, so far as the power to withdraw public lands from sale is concerned, such a delegation could be spelled out from long continued Congressional acquiescence in the executive practice. The answer to whether a similar delegation occurred with respect to the power to convey a compensable interest in these lands to the Indians must be found in the available evidence of what consequences were

> thought by the executive and Congress to flow from the establishment of executive order reservations." (footnote omitted)

Similarly, the fact that Congress has by implication delegated to the Executive the power to reserve public lands for public purposes does not establish that Congress has impliedly delegated to him the power to reserve navigable waters for use on those lands. Additional and independent evidence of a congressional delegation of such enlarged authority is necessary.

In *Sioux,* the Court could find no such evidence. Reviewing the history of executive order Reservations, the Court concluded that the power to convey a compensable interest in lands set apart for Indian Reservations had not been delegated to the President by Congress, stating:

> "Although there are abundant signs that Congress was aware of the practice of establishing Indian reservations by executive order, there is little to indicate what it understood to be the kind of interest that the Indians obtained in these lands" 316 U. S. at 328.

The Court noted that in 1892 the Senate Committee on Indian Affairs had expressed the opinion that under an executive order "the Indians were given a license to occupy the lands described in it so long as it was the pleasure of the Government they should do so, and no right, title, or claim to such lands has vested in the Indians by virtue of this occupancy".[62] It also regarded as "striking proof of the belief shared by Congress and the Executive that the Indians were not entitled to compensation upon the abolition of an executive order reservation" the fact that there

---

[62] 316 U. S. at 328, quoting from S. Rep. No. 664, 52d Cong., 1st Sess. 2 (1892).

was an "absence of compensatory payments in such situations". 316 U. S. at 330. The Court concluded:

> "We conclude therefore that there was no express constitutional or statutory authorization for the conveyance of a compensable interest to petitioner by the four executive orders of 1875 and 1876, and that no implied Congressional delegation of the power to do so can be spelled out from the evidence of Congressional and executive understanding." 316 U. S. at 331..

By the same token, the Acts of Congress and the pronouncements of the Executive which recognize the need to acquire appropriative rights to the use of water in the Colorado River Indian Reservation (pp. 142-47, *infra*) are "a striking proof of the belief shared by Congress and the executive" that water had not been reserved for the use of that Reservation.

In view of the constitutional provision which vests in Congress the "Power to make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States" (art. 4, §3, cl. 2) and since the question presented is an open one for decision in this Court, we believe its determination should be approached in the light of the principles expressed by Mr. Justice Day in his dissent in the *Midwest Oil* case, 236 U. S. at 511, quoting in part from *Kilbourn* v. *Thompson,* 103 U. S. 168, 190-91 (1881):

> " 'It is believed to be one of the chief merits of the American system of written constitutional law, that all the powers intrusted to government, whether State or National, are divided into the three grand departments of the executive, the legislative, and the judicial. That the functions appropriate to each of these branches of government shall be vested

in a separate body of public servants, and that the perfection of the system requires that the lines which separate and divide these departments shall be broadly and clearly defined. It is also essential to the successful working of this system that the persons intrusted with power in any one of these branches shall not be permitted to encroach upon the power confided to the others, but that each shall by the law of its creation be limited to the exercise of the powers appropriate to its own department and no other.'

"These principles ought not to be departed from in the judicial determinations of this court, and their enforcement is essential to the administration of the Government, as created and defined by the Constitution. The grant of authority to the Executive, as to other departments of the Government, ought not to be amplified by judicial decisions. The Constitution is the legitimate source of authority of all who exercise power under its sanction, and its provisions are equally binding upon every officer of the Government, from the highest to the lowest. It is one of the great functions of this court to keep, so far as judicial decisions can subserve that purpose, each branch of the Government within the sphere of its legitimate action, and to prevent encroachments of one branch upon the authority of another."

C. Necessity for a Clear Manifestation of Intent to Reserve Navigable Water

The settled policy of the United States to hold navigable streams within federal territories in trust for future states raises a presumption against a disposal of those waters by the United States, which must be overcome in each individual case by a clear manifestation of an intention on the part of the United States to dispose of the waters as claimed. *United States* v. *Holt State Bank,* 270 U. S. 49, 55 (1926); *Shively* v. *Bowlby,* 152 U. S. 1, 49, 57, 58 (1894).

In *Holt State Bank*, holding that title to the lands underlying the navigable waters within the Red Lake Indian Reservation passed to the State of Minnesota upon its admission into the Union and had not been reserved by the Chippewas through a succession of treaties whereby they had ceded to the United States their aboriginal right of occupancy to surrounding lands, this Court enunciated the governing legal principles as follows:

> "But, as was pointed out in *Shively* v. *Bowlby*, pp. 49, 57-58, the United States early adopted and constantly has adhered to the policy of regarding lands under navigable waters in acquired territory, while under its sole dominion, as held for the ultimate benefit of future states, and so has refrained from making any disposal thereof, save in exceptional instances when impelled to particular disposals by some international duty or public exigency. It follows from this that disposals by the United States during the territorial period are not lightly to be inferred, and should not be regarded as intended unless the intention was definitely declared or otherwise made very plain." 270 U. S. at 55.

The Court considered the decisive question to be "whether the lands under the lake were disposed of by the United States before Minnesota became a state" and it answered this question in the negative on the basis of considerations stated as follows:

> "An affirmative disposal is not asserted, but only that the lake, and therefore the lands under it, was within the limits of the Red Lake Reservation when the State was admitted. The existence of the reservation is conceded, but that it operated as a disposal of lands underlying navigable waters within its limits is disputed. We are of opinion [*sic*] that the reservation was not intended to effect such a

disposal and that there was none. If the reservation operated as a disposal of the lands under a part of the navigable waters within its limits it equally worked a disposal of the lands under all. Besides Mud Lake, the reservation limits included Red Lake, having an area of 400 square miles, the greater part of the Lake of the Woods, having approximately the same area, and several navigable streams. The reservation came into being through a succession of treaties with the Chippewas whereby they ceded to the United States their aboriginal right of occupancy to the surrounding lands. The last treaties preceding the admission of the State were concluded September 30, 1854, 10 Stat. 1109, and February 22, 1855, 10 Stat. 1165. There was no formal setting apart of what was not ceded, nor any affirmative declaration of the rights of the Indians therein, nor any attempted exclusion of others from the use of navigable waters. The effect of what was done was to reserve in a general way for the continued occupation of the Indians what remained of their aboriginal territory; and thus it came to be known and recognized as a reservation. *Minnesota* v. *Hitchcock,* 185 U. S. 373, 389. There was nothing in this which even approaches a grant of rights in lands underlying navigable waters; nor anything evincing a purpose to depart from the established policy, before stated, of treating such lands as held for the benefit of the future State. Without doubt the Indians were to have access to the navigable waters and to be entitled to use them in accustomed ways; but these were common rights vouchsafed to all, whether white or Indian, by the early legislation reviewed in *Railroad Co.* v. *Schurmeir,* 7 Wall. 272, 287-289, and *Economy Light & Power Co.* v. *United States, supra,* pp. 118-120, and emphasized in the Enabling Act under which Minnesota was admitted as a State, c. 60, 11 Stat. 166, which declared that the rivers and waters bounding the State 'and the navigable waters leading into the

> same shall be common highways, and forever free, as well to the inhabitants of said State as to all other citizens of the United States.' " 270 U. S. at 57-59 (footnote omitted).

This is true where the claimed reservation of water is based upon an act of Congress. *A fortiori* it is true with respect to an alleged reservation of water by executive order, assuming for purposes of argument that the power to reserve water can be, or in the particular case has been, delegated to the Executive by Congress.

In determining whether rights in navigable waters have been reserved for the benent of Indian Reservations, this Court has distinguished between cases in which the Reservation consists of lands remaining as a residue after treaty cessions of tribal lands held in aboriginal possession and cases in which an Indian Reservation is created out of public lands of the United States set apart for occupancy as a Reservation.

For example, in *United States* v. *Winans,* 198 U. S. 371 (1905), the Court upheld rights of the Yakima Indians to take fish from a navigable stream where their fishing rights had been reserved in a treaty which granted to the United States lands held in aboriginal possession. Significantly, the Court regarded the "pivot of the controversy" to be the construction of the treaty. It found that the treaty was not a grant to the Indians but a reservation by them of rights already possessed and that the rights so reserved imposed a servitude on the land ceded to the United States by the treaty.

The Indian Reservations here involved are not treaty Reservations. All of them consist of lands set apart from the public domain for Indian occupancy by congressional act or executive order.

Moreover, it is much more difficult to find an intention to reserve the right physically to withdraw and consume the water of a navigable stream or to alienate title to the bed thereof than it is to find a reservation of rights, such as the right to fish, the exercise of which does not involve any withdrawal or consumption of the water itself. Compare for example, *Alaska Pacific Fisheries* v. *United States*, 248 U. S. 79 (1918), which held that Congress in setting apart by statute the "body of lands known as Annette Islands" intended to reserve fishing rights in the offshore waters, with *United States* v. *Holt State Bank*, 270 U. S. 49 (1926), in which a reservation of land by Indian treaty was held not to have reserved navigable water for use on the land reserved.

D. Lack of Evidence of an Intent to Reserve Water for Indian Reservations

There is no evidence in the case at bar sufficient to warrant the finding that the United States in establishing the Colorado River and Fort Mohave Indian Reservations intended to reserve water of the Colorado River for the use of those Reservations (A Exc. 10, 19, 21).[63] Indeed the evidence is to the contrary.

(1) Colorado River Indian Reservation

On March 3, 1865, Congress established the Colorado River Indian Reservation by a statute which described the lands withdrawn for Reservation purposes as follows:

[63] Since the Cocopah Reservation was created by executive order after Arizona had been admitted to statehood, its establishment was ineffective to reserve water of the Colorado River for use on the Reservation (pp. 121-24, *supra*). In all events, the executive order creating the reservation (U. S. 1001) contains no mention of water, nor any expression of an intent to reserve water for the Reservation. Nor does the record contain any evidence of the circumstances surrounding the creation of the Reservation from which an intent to reserve water may be inferred.

> "All that part of the public domain in the Territory of Arizona, lying west of a direct line from Half-Way Bend to Corner Rock on the Colorado River, containing about seventy-five thousand acres of land, shall be set apart for an Indian reservation for the Indians of said river and its tributaries."[64]

Thus, the statute does not even mention water of the Colorado River much less make any reservation of that water.

On November 22, 1873, President Grant issued an executive order directing that there be withdrawn from sale and added to the Colorado River Indian Reservation

> "all that section of bottom land adjoining the Colorado Reserve, and extending from that Reserve on the north side to within 6 miles of Ehrenberg on the south, bounded on the west by the Colorado River, and east by mountains and mesas." (US 503)[65]

Here again no water of the Colorado River was set apart for use on the Reservation.

An executive order of November 16, 1874 further enlarged the Reservation by extending it into the state of California and described the tract as "embraced within the following . . . boundaries":

> "Beginning at a point where the La Paz Arroyo enters the Colorado River, 4 miles above Ehrenberg thence easterly with said arroyo to a point south of the crest of La Paz Mountain; thence with said crest of mountain in a northerly direction to the top of Black Mountain; thence in a northwesterly direction

[64] 13 Stat. 559.

[65] All of the executive orders relating to Indian Reservations have been collected and published by the Department of the Interior in two volumes entitled "Executive Orders Relating to Indian Reservations", the first volume including those orders issued up to 1912 and the second volume those issued between 1912 and 1922.

> across the Colorado River to the top of Monument Peak, in the State of California; thence southwesterly in a straight line to the top of Riverside Mountain, California; thence in a southeasterly direction to the point of beginning, be, and the same is hereby, withdrawn from sale and set apart as the reservation for the Indians of the Colorado River and its tributaries." (US 504)

Once again the executive order made no mention of water of the Colorado River.

On January 31, 1876, the United States Indian Agent reported to the Commissioner of Indian Affairs that the boundaries as defined by the executive order of 1874 crossed the Colorado River twice and cut off a large tract of land on the east side of the river which was being settled by non-Indians for unlawful and improper purposes. The Agent requested that an executive order be obtained "making the ~~Colorado~~ River the boundary line". The Commissioner of Indian Affairs and the Secretary of the Interior approved the recommendations (US 505A, 505B, 505C). Thereafter on May 15, 1876, an executive order issued which re-defined the boundaries of the Reservation and contained the following description of the western boundary:

> ". . . thence southwesterly in a straight line to the top of Riverside Mountain, California; thence in a direct line toward the place of beginning to the west bank of the Colorado River; thence down said west bank to a point opposite the place of beginning; thence to the place of beginning." (US 505)

Thus, neither the Act of Congress which created this Reservation nor the executive orders which enlarged it contain any express manifestation of an intent to reserve

water of the Colorado River for use on the Reservation. By their terms, they deal only with a withdrawal of lands from the public domain. No mention of water is made. It was undoubtedly contemplated that the United States might acquire for the benefit of the Indians a right to water by actual use, but there is no basis whatever for inferring an intent to reserve any water from the Colorado River for the Reservation or to reserve such water in an amount sufficient to irrigate all of the irrigable acreage in the Reservation.

To the contrary, as the legislation enacted by Congress following the establishment of the Colorado River Indian Reservation clearly demonstrates, Congress did not consider that there had been a withdrawal of water for that Reservation either by the statute creating the Reservation or by its subsequent enlargement by executive order.

Section 25 of the Act of April 21, 1904,[66] provides in part:

> "That in carrying out any irrigation enterprise which may be undertaken under the provisions of the reclamation Act . . . and which may make possible and provide for, in connection with the reclamation of other lands, the reclamation of all or any portion of the irrigable lands on the Yuma and Colorado River Indian Reservations in California and Arizona, the Secretary of the Interior is hereby authorized to divert the waters of the Colorado River and to reclaim, utilize, and dispose of any lands in said reservations which may be irrigable by such works in like manner as though the same were a part of the public domain."

In *United States* v. *Arizona*, 295 U. S. 174, 185 (1935), this Court construed the quoted language thus:

---

[66] 33 Stat. 224.

> "The purpose was not to prescribe or regulate the means to be employed to divert water from the Colorado but to extend the reclamation law to the Indian reservations named. It was merely to empower the Secretary, if the circumstances stated should arise, to reclaim lands in these reservations by use of water to be taken from that river. The authority granted was no more than permission to appropriate them for the purpose specified."

This declared intention "to extend the reclamation law" to the Colorado River Indian Reservation is clearly inconsistent with the Master's conclusion that, long prior to the statute, sufficient water from the Colorado River had been reserved to irrigate all the irrigable acreage within the Reservation.

Section 8 of the Reclamation Act[67] provides in part:

> "That nothing in this act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this act, shall proceed in conformity with such laws, and nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof."

It is inconceivable that Congress would have thus required the Secretary to acquire water rights for this Reservation by appropriation under state law if it had thought that a reserved water right with a priority date of 1865 already existed for these lands.

---

[67] 32 Stat. 390 (1902), 43 U. S. C. §383 (1958).

Section 8 of the Reclamation Act also prescribes that "beneficial use shall be the basis, the measure, and the limit of the right".[68] This requirement cannot be reconciled with the concept that a water right may be acquired by reservation without any physical application of water to a beneficial use.

Moreover, later congressional enactments demonstrate even more plainly that Congress itself did not believe that the mere creation or enlargement of the Reservation had set apart water of the Colorado River for use on the Colorado River Indian Reservation.

Congress, in the Act of April 4, 1910,[69] appropriated $50,000

> "For the construction of a pumping plant to be used for irrigation purposes on the Colorado River Reservation, together with the necessary canals and laterals, for the utilization of water in connection therewith, *for the purposes of securing an appropriation of water* for the irrigation of approximately one hundred fifty thousand acres of land . . . to be reimbursed from the sale of the surplus lands of the reservation."

This specific grant of funds to enable the Secretary to make an appropriation of water for use in the Reservation is irreconcilable with the view that, by the very creation of the Reservation, water had been reserved for use upon it.

The Secretary of the Interior in 1910 was also of the view that there had been no automatic reservation of water of the Colorado River for use on the Reservation. In a communication dated February 24, 1910 to the Chairman of the Senate Committee on Indian Affairs, the Secretary

---

[68] 32 Stat. 390 (1902), 43 U. S. C. §372 (1958).

[69] 36 Stat. 273.

recommended passage of what became the Act of April 4, 1910, referred to the proposed treaty between the United States and Mexico regarding a division of the water of the Colorado River, and stated that it had been tentatively agreed between the representatives of the respective governments:

> "That each country will recognize all water rights in the Colorado River which have been initiated prior to the final adjustment of the contemplated treaty, providing such rights have been acquired through actual construction or beneficial use. That afterwards all irrigation carried out which has not initiated a right must share equally on a proportionate acreage basis in the cost of the necessary storage reservoirs."[70]

The Secretary continued:

> "If no irrigation project is entered upon by this Government, it is not at all improbable that this great area of rich, irrigable land, approximating 150,000 acres, will be deprived of a water supply, unless the construction of extensive storage reservoirs is undertaken. Even eliminating Mexico from consideration, filings are being made by citizens and corporations upon the waters of this river, and if rights are to be initiated for these Indians' lands, the work should be started at an early date, with a view to making a proper appropriation. The department is aware, and the subject has been brought to the attention of Congress, as is evidenced by the language of section 25 of the act of April 21, 1904 (33 Stat. L., 224), that a reclamation project was contemplated on the Colorado River Reservation under similar provisions to the one now under way at Yuma, Ariz. The depleted state of the reclamation fund

[70] S. Rep. No. 357, 61st Cong., 2d Sess. 14 (1910).

has, however, prevented any action toward the carrying out of this project.

"It will be observed from the foregoing that the initiation of irrigation work at an early day on the Colorado River Indian Reservation is of the highest importance, and I recommend that there be included in the Indian appropriation bill an item carrying $50,000 for establishing an irrigation system on this reservation. If this amount, which should be reimbursable from the sale of the surplus lands of the reservation, should be made available, it would be possible to install a pumping plant and distributing system to irrigate approximately 3,000 acres. Such a system could be so constructed as to fit into and become a part of any larger gravity irrigation system which might be constructed at a later date. In this manner a just claim upon sufficient water to irrigate the 150,000 acres on the reservation can be established."[71]

This is persuasive evidence that Congress and the Secretary of the Interior both recognized that neither when the Colorado River Indian Reservation was established in 1865 nor at any time thereafter had there been any withdrawal of Colorado River water for use on the Reservation; and further, that rights to that water would necessarily have to be acquired, if at all, by actual appropriation and application to beneficial use within the Reservation.

Each year after the passage of the Act of April 4, 1910 through 1919, Congress in making appropriations for the Colorado River Indian Reservation made reference to the Act of April 4, 1910, and in each instance provided expressly that the work done was "for the purposes of securing an appropriation of water" for irrigation. Thereafter, in making each annual appropriation through 1942, the inten-

[71] *Id.* at 14.

tion to provide funds to make an appropriation of water was restated by referring to the Act of April 4, 1910 (US 507).

The fact that each of these thirty-two annual appropriations of funds was, either expressly or by reference back to the Act of April 4, 1910, made "for the purpose of securing an appropriation of water" for irrigation is wholly inconsistent with the theory of the Special Master that by the establishment of the Colorado River Indian Reservation Congress intended to reserve rights to the use of so much water from the Colorado River as would be necessary to irrigate all of the practicably irrigable acreage therein and to satisfy related uses (Rep. 265), and that the President in enlarging the Reservation in 1873 and 1874 had a similar intention.

Following the enactment of a rivers and harbors improvement act in 1935,[72] Congress made a series of appropriations pursuant to §2 of the Act for, among other things, "construction, repair, and rehabilitation of irrigation systems on Indian reservations" and "*for the purchase of water rights,* ditches, and lands needed for such projects; and for drainage and protection of irrigable lands from damage by floods or *loss of water rights.*"[73] This legislation covers the period 1935 through 1949 (U. S. 507). Each act makes an appropriation specifically for the Colorado River Indian Reservation.

These statutes, which repeatedly appropriated funds for "purchase of water rights" and for "protection of irrigable lands from . . . loss of water rights", are contradictory of

---

[72] Act of August 30, 1935, 49 Stat. 1028.

[73] 50 Stat. 579 (1937); 52 Stat. 307 (1938); 53 Stat. 702 (1939); 54 Stat. 422 (1940); 55 Stat. 319 (1941); 56 Stat. 517 (1942); 60 Stat. 356 (1946); 61 Stat. 467 (1947); 62 Stat. 1119 (1948); 63 Stat. 772 (1949).

the Master's theory that, upon the establishment of the Colorado River Indian Reservation in 1865 and upon its enlargement in 1873 and 1874, there was automatically reserved for its benefit all the water of the Colorado River which might ever be needed to irrigate all the irrigable acreage within the Reservation.

(2) Fort Mohave Indian Reservation

The area which is now referred to as the Fort Mohave Indian Reservation was originally set aside as a military reserve (US 1301).

In 1890, this military post was transferred to the Department of the Interior for Indian school purposes (US 1303) pursuant to the Act of July 31, 1882,[74] entitled "An Act to provide additional industrial training schools for Indian youth, and authorizing the use of unoccupied military barracks for such purpose." This Act provided:

> "That the Secretary of War be, and he is hereby, authorized to set aside, for use in the establishment of normal and industrial training-schools for Indian youth from the nomadic tribes having educational treaty claims upon the United States, any vacant posts or barracks, so long as they may not be required for military occupation, and to detail one or more officers of the Army for duty in connection with Indian education, under the direction of the Secretary of the Interior, at each such school so established: *Provided,* That money appropriated or to be appropriated for general purposes of education among the Indians may be expended, under the direction of the Secretary of the Interior, for the education of Indian youth at such posts, institutions, and schools as he may consider advantageous, or as

[74] 22 Stat. 181.

> Congress from time to time may authorize and provide."

The stated purpose of this transfer to the Department of the Interior was to permit the use of the military post and barracks for an industrial training school for Indian youth. The transfer did not by its terms even create an Indian "Reservation" and certainly cannot support a finding of an intent to withdraw water from the Colorado River for Reservation uses.

The first mention of a "Fort Mojave Indian Reservation" to be found in the record appears in an executive order dated December 1, 1910 (US 1304), which was superseded by the executive order of February 2, 1911 (US 1305), withdrawing additional lands and setting them apart

> " . . . as an addition to the present Fort Mojave Indian Reservation, in Arizona, for the use and occupation of the Fort Mojave and such other Indians as the Secretary of the Interior may see fit to settle thereon. . . ."

Neither of these two orders made any mention of water.

The executive order of February 2, 1911 set aside about 18,000 acres of bottom lands embraced in the even-numbered sections in the Mohave Valley. The odd-numbered sections in the area had already been granted to the Atlantic & Pacific Railroad (now the Santa Fe Railroad) which had in 1904 sold this land to the Rio Colorado Land & Irrigation Company (US 1315, Hist. of Reservation, p. 1). In 1910, the Cotton Land Company bought these odd-numbered sections from the Rio Colorado Land & Irrigation Company (US 1315, Hist. of Reservation, p. 3). As a result, alternate sections in the Mohave Valley were privately owned at the time the executive order was issued in 1911, so that land

ownership in the area was complicated by a checkerboard pattern.

In 1910, the Chief Engineer of the Indian Irrigation Service recommended the adoption of an agreement whereby the Cotton Land Company proposed to sell water rights to the Indian lands at $25 per acre (US 1315, Hist. of Reservation, p. 3; US 1316, p. 3). Obviously, he would not have made such a recommendation had he believed that the Indians were already the owners of more than sufficient water to meet all of their Reservation needs.

We find nothing in the foregoing acts of the United States in creating and enlarging the Fort Mohave Indian Reservation which gives any indication of the existence of an intent to reserve water of the Colorado River for use on that Reservation. To the contrary, the conduct of the United States negatives such an intent.

(3) Additional Considerations Applicable to Both Reservations

There is other evidence that Congress did not consider that the activities of the United States in withdrawing land from the public domain for use as an Indian Reservation operated also to reserve water for use on the Reservation. In acts specifically dealing with rights to use water on certain Indian Reservations Congress has specified that such rights should depend on appropriation under state law.[75]

---

[75] For example, the Act of May 30, 1908, §2, 35 Stat. 558, 560, dealing with the Fort Peck Indian Reservation, provides: "All appropriations of the waters of the reservation shall be made under the provisions of the laws of the State of Montana." See also the Act of March 1, 1907, 34 Stat. 1035 (Blackfeet Indian Reservation); Act of June 21, 1906, 34 Stat. 375 (lands of Uncompahgre, Uintahs and White River Utes); and Act of March 3, 1905, 33 Stat. 1020 (lands of Shoshone Indians).

The fact that, when the attention of Congress was focused on the matter of the right to use water on an Indian Reservation, it provided that such rights be acquired under state law runs completely counter to the existence of an intent to secure such water rights by reserving or withdrawing water for use on Indian Reservations.

There is an additional reason for believing that the Master's theory is unsound. At the time the Colorado River Indian Reservation was created and enlarged, California had already attained statehood. It follows that any reservation of water that could be implied from the withdrawal of land for purposes of the Reservation would be ineffective as against California because, at the time the withdrawal of land was made, the United States was without power to reserve navigable water as against California (pp. 121-24, *supra*). To say that the United States intended to reserve water flowing in the Colorado River within the Territory of Arizona, when it was powerless to reserve the water of the same stream flowing in the State of California, is to impute to the United States the intent to deny the future State of Arizona the same sovereign rights then enjoyed by California. That the United States intended so to "contract the sovereignty" of Arizona prior to its admission into the Union, when the State of California on the opposite side of the stream was already in possession of full sovereign rights as to its part of that stream, is not to be implied in the absence of compelling evidence.

As was stated in *United States* v. *Texas*, 339 U. S. 707, 720 (1950):

> "For equality of States means that they are not 'less or greater, or different in dignity or power.' See *Coyle* v. *Smith*, 221 US 559, 566."

It may not be rightly assumed that the national government intended to confine Arizona to a sovereignty with respect to its navigable waters which, in dignity or power, is less than that of its sister state across the river.

At the time of the creation of the Fort Mohave Indian Reservation, California and Nevada had both been admitted to statehood. Therefore, the same considerations which mitigate against a reservation of water for the Colorado River Indian Reservation are equally applicable to the Fort Mohave Indian Reservation.

The Special Master's Report gives no recognition to any of the foregoing matters which negative the existence of an intent to reserve Colorado River water for the Colorado River and Fort Mohave Indian Reservations. Instead he finds "that the United States intended to reserve mainstream water for the reasonable future needs of the . . . Reservations" upon the grounds that "it was intended that the Indians would settle on the Reservation land and develop an agricultural economy", that the land "is too arid to support such an economy without irrigation from the Colorado River", and that it "would be unconscionable for the United States to have coerced or induced Indians onto a Reservation without providing the water necessary to make the lands habitable" (Rep. 259-60).

The Master's view that if the Indians "were thrown into competition with the more advanced non-Indians in a race to acquire rights to water by putting it to beneficial use, they would have lost the match before it was begun" (Rep. 261) is unrealistic, to say the least.

When the Colorado River Indian Reservation was created by Congress in 1865 the vast water resources of the Colorado River were virtually untouched. The entire Colorado River basin was frontier area, sparsely settled and almost entirely undeveloped. Demands against the water

of the Colorado River were small and unimportant, as there was little irrigation practiced in the Lower Basin, no large centers of population were in existence to require water for municipal, industrial and domestic purposes and the diversion and use of large quantities of water by multi-purpose projects was not even thought of. Most of the millions of acre-feet of water which drained into the Colorado flowed practically unused to the Gulf of Mexico, and it was not contemplated or even imagined that the resources of the River would ever be inadequate to meet all foreseeable needs, both Indian and non-Indian. While it was undoubtedly assumed that the Indians of the Colorado River Indian Reservation would use some water of the river for agricultural and other purposes, the water flowing by the Reservation and there for the taking exceeded by far all anticipated requirements. The problem confronting the United States as guardian of the Indians on the Colorado River Indian Reservation was not how to compete successfully with others for a share in a limited water supply, but how best to divert and utilize a bountiful water resource, more than ample for all the Indians' needs.

Under these circumstances, there was no occasion to reserve any water for the protection of the Indians resident upon the Reservation, nor was there any thought that they would be "thrown into competition with the more advanced non-Indians in a race to acquire rights to water by putting it to beneficial use" (Rep. 261).

What has just been said regarding the Colorado River Indian Reservation applies with equal force to the Fort Mohave Indian Reservation.

E. Indian Needs, Rather Than Irrigable Acreage, the Correct Measure of Any Reserved Water Right

Arizona does not concede that water was reserved for use on the Reservations involved. However, in the event the Court should hold that there was such a reservation of water, the question will arise as to what amount was set apart.

The Special Master concludes that there was reserved "sufficient water to irrigate all of the practicably irrigable lands in a Reservation and to supply related stock and domestic uses" (Rep. 262).

It should be kept in mind that the water with which we are here concerned is not only a precious and limited natural resource, but one which cannot be preserved intact or stock-piled if not used. Advance planning and construction of dams and irrigation works to store and divert the water is necessary if it is to be put to maximum beneficial use, with the result that non-Indian users cannot take full advantage of the failure of Reservation Indians, as beneficiaries of prior reserved rights, to utilize the water reserved for them. Therefore, if water is set aside or reserved for purposes which do not result in its utilization, it runs unused to the sea or evaporates and is thus irretrievably lost. Accordingly, the Court will be most reluctant, we are sure, to adopt a concept of water rights, whether for Indians or non-Indians, which would involve the waste or non-use of this rare "treasure". *New Jersey* v. *New York*, 283 U. S. 336, 342 (1931).

The only justification for the concept that presently unused and unneeded quantities of water should be set aside to meet future needs of Indians is that this action

is necessary to afford a retarded class of citizens the equality of opportunity which would be denied to them if they were forced to compete with their more advanced neighbors. If it be acknowledged that this view is sufficient justification for conferring upon our Indian citizens special prerogatives in the use of water, then a proper regard for the rights and welfare of non-Indian citizens requires that these special privileges be granted the nation's Indian wards only when and to the extent that they are necessary for the Indians' protection and advancement.

Thus the yardstick for any reserved right to use water on Indian Reservations must be one which can be justified as setting aside for the Indians the amount of water required for their reasonable needs. We do not dispute the conclusion of the Master that the quantity reserved should be sufficient for reasonable future needs. We agree that uses or needs existing either now or at the time the Reservations were established are not the only measure of the amount reserved. We also concur that an open-end decree which would leave the reserved amount uncertain and subject to fluctuation is neither desirable nor necessary. However, we submit that an unsatisfactory and indeed extreme criterion should not be adopted simply because it permits of certainty and definiteness; and we assert that any measurement of the reserved quantity must be rejected unless it is demonstrably commensurate with the reasonably foreseeable needs of the Indians themselves. The irrigable acreage yardstick does not meet that test (A Exc. 11, 15-16, 19-22).

What constitutes irrigable land is itself a matter of uncertainty and is subject to frequent change, depending upon prevailing practices in evaluating the chemical composition of soils and their depth, texture, permeability,

slope, drainage, salinity, alkalinity, elevation and topography, as well as climatic conditions and a host of other factors.

For example, the soil survey made in 1940-1941 covering 115,900 acres of bottom lands in the Colorado River Indian Reservation within Arizona resulted in the conclusion that there were 68,432 irrigable acres within that portion of the Reservation (C 2619, p. 7). But the studies made by the Office of Indian Affairs in 1955-1956 for purposes of this litigation purport to show that there are 112,402 irrigable acres in the Arizona portion of the Colorado River Indian Reservation (US 560). Only some fifteen years separate these two studies, yet the earlier figure has been increased by approximately 68%.[76] The lesson of these figures is plain: The number of acres within an Indian Reservation regarded as irrigable depends on the date the question is decided.

Certainly at the time these Reservations were created and enlarged the number of irrigable acres within them was unknown. And it seems likely that other factors such as the availability of land owned by the United States in the vicinity where the Indian tribes traditionally lived, the location of natural monuments which would permit of reasonably accurate descriptions in these unsurveyed areas, the desirability of setting aside a contiguous area of land, as well as other considerations, played a part in the selection of the lands included within these Reservations.[77] But had the lands within the Reservations been selected on the basis of the amount of irrigable acreage included and with the

---

[76] The 1955-1956 studies by the Office of Indian Affairs found 105,210 acres of bottom or valley lands and 7,192 acres of mesa lands on the Colorado River Indian Reservation suitable for irrigation. These figures are gross and were reduced by 12% for rights-of-way, farmsteads, etc., leaving a net of 92,859 acres of valley lands and 6,329 acres of mesa lands (Tr. 14267-8).

[77] U. S. 505-A.

intent of reserving sufficient water to irrigate all the irrigable land within the Reservations, it is undeniable that the quantity then considered irrigable would have been far less than the latest opinion of the experts in this field.

If the amount of irrigable lands is to be the sole measure of the quantity of water reserved for use on these Reservations, it is immaterial whether the water will ever be used by the Indians or even whether any Indians occupy the Reservation to make use of the water reserved.

That the amount of water reserved under the irrigable acreage formula has no relationship to the water required to meet the needs of the Indians is strikingly demonstrated by a consideration of the amount of water reserved per member of the different tribes of the five main stream Reservations by application of the Master's irrigable acreage standard:

Tribe	Tribal Population[78]	Maximum Diversion Per Year in Acre Feet[79]	Annual Diversion per Member of Tribe in Acre Feet
Ft. Mohave Indian Tribe.....	450	122,648	272.55
Cocopah Indian Tribe.....	90	2,744	30.49
Colorado River Indian Tribes	1,300	717,148	551.65
Quecham Indian Tribe (Yuma Res.)	1,200	51,616	40.01
Chemehuevi	300	11,340	37.80

These figures expose the fundamental weakness of the irrigable acreage formula—namely, it has no necessary relationship to the reasonable needs of the Indians for whose benefit the water is set apart. The formula denies non-Indian citizens the use of a precious resource without any assurance or likelihood that it will be used by the Indians.

As the basic authority for the adoption of the irrigable acreage standard, the Master relies primarily on this

[78] Rep. 85-88.

[79] Rep. 350-51.

Court's decision in *Winters* v. *United States,* 207 U. S. 564 (1908). However, neither that case nor the others cited by the Master held that the extent of a reserved water right is measured by the quantity of water necessary to irrigate all the irrigable acreage of a Reservation. The Master states that "the *Winters* case has been cited many times as establishing that the United States may, when it creates an Indian Reservation, reserve water for the future needs of that Reservation. . . ." (Rep. 258) He then concludes that the United States, in setting aside land as a reservation, must have intended that every irrigable acre would eventually be irrigated and therefore sufficient water was reserved for that purpose (Rep. 262). This conclusion is without precedent and, as will be demonstrated, leads to inequitable results when applied to the Indian Reservations with which we are concerned.

The Master rejects the reasonable needs of the Indians as the proper measure of the reserved right because of "the difficulty of predicting the future needs of Indian Reservations" (Rep. 264). He overlooks the fact that this "difficulty" has not prevented the use of this yardstick by the courts in the majority of the cases cited by him. Furthermore, as we have just seen, the standard of irrigable acreage is itself uncertain because of the ever changing concepts of irrigability.

The Court of Appeals in the *Winters* case[80] enjoined uses by non-Indians which would in any manner interfere with the use of 5,000 inches of water of the Milk River, a non-navigable stream, on the Fort Belknap Reservation in Montana. The decision states that there were about 30,000 acres of land within the Reservation susceptible of irrigation with the water of the Milk River but that:

---

[80] 143 Fed. 740 (9th Cir. 1906).

> "... As alleged in the complaint, 'approximately 5,000 acres of land are being irrigated upon said reservation for the purpose of producing thereon crops of hay, grass, grain, and vegetables with the waters diverted by means of said canal and lateral ditches distributing said waters from said canal over the lands.' This canal has a carrying capacity of at least 5,000 inches of water, and such amount of water is required for the *present needs and requirements* of the government and the Indians, for household, domestic, agricultural, and irrigating purposes on said reserve." 143 Fed. at 741.

The Court of Appeals actually rejected the claim of the United States to all the water of the Milk River for the irrigation of all lands on the Reservation susceptible of cultivation and, instead of predicating the rights of the Indians on the amount of water required for the irrigation of the 30,000 acres of irrigable Reservation lands, limited their rights to the 5,000 inches required for the irrigation of the 5,000 acres then being irrigated and for domestic and stock-watering purposes.

The affirmance of that decision by this Court was in effect a rejection of the Government's claim to the quantity of water necessary for the irrigation of all irrigable lands and a clear recognition of the present needs of the Indians living on the Reservation as the governing criterion.[81]

---

[81] This Court did not hold differently in *United States* v. *Powers*, 305 U. S. 527 (1939). All that was there decided was that the Secretary of the Interior could not completely exclude allottees of lands, within an Indian Reservation but outside the government irrigation project for that Reservation, from sharing in the use of whatever waters might have been reserved by the treaty creating the Reservation. No determination was made as to the extent of the allottees' share. See also the decision of the Court of Appeals in the same case, which disapproved the trial court's attempt to admeasure the shares of the allottees. 94 F. 2d 783, 786 (9th Cir. 1938).

The Special Master also cites *Conrad Inv. Co.* v. *United States,* 161 Fed. 829 (9th Cir. 1908). As we read that decision, it was actually based on the needs of the Indians. The United States there claimed all the waters of a non-navigable stream for use on all Reservation lands suitable for farming and ranching. Irrigable acreage within the Reservation totaled 10,000 acres. Stream flow varied from a minimum of 2,500 inches to a maximum of 150,000 inches. The trial court rejected the United States' claim to the entire flow of the stream, finding that:

> "[T]he testimony adduced does not bear them [the Government's allegations] out, and the question recurs whether the government is now entitled to the amount of water which it alleges *has been* diverted. I am of the opinion that it is so entitled." 156 Fed. 123, 130 (C. C. D. Mont. 1907).

Accordingly, a decree enjoining the defendant from making a diversion which would reduce the flow available to the United States below 1,666⅔ inches was entered by the trial court and affirmed on appeal.

The *Conrad* case therefore really involves a refusal to apply the irrigable acreage test to a determination of quantity because, had that test been applied, the United States would have been awarded at least 2,000 inches. While it is true that the trial judge found 1,666⅔ inches would have been sufficient for the irrigation of 10,000 acres, he also found that this quantity was sufficient for "the present *needs,* considering that much of the land will be irrigated for pasture only" and that the Government should "conserve the waters of such streams as traverse or border the reserve as to supply the Indians fully in their probable, or, I may say, even possible future *needs*. . . ." 156 Fed. 123, 129, 130-31.

Since the Ninth Circuit Court of Appeals took into account the issue of quantity in affirming the decision for less than the amount requested by the United States, it tacitly endorsed the trial court's reliance on past actual use in determining quantity.

Nor does the decision of the Court of Appeals in *United States* v. *Ahtanum Irrigation Dist.*, 236 F. 2d 321 (9th Cir. 1956), *cert. denied*, 352 U. S. 988 (1957), apply the irrigable acreage test. The question there presented for decision was whether the United States was bound by an agreement entered into in 1908 between the Department of the Interior and certain non-Indians which gave the latter the right to divert and use water from Ahtanum Creek, a non-navigable stream, even though the United States contended that the agreement deprived the Indians of water needed on the Reservation. Since the Court of Appeals held that the agreement was binding, there was no occasion for it to consider the question of the measurement of a reserved water right.

Although the *Ahtanum* case did not present an issue as to quantity, since it was "conceded that the present needs of the Indians are sufficient to require substantially the whole flow of the stream", 236 F. 2d at 325, the court reviewed the previous decisions on the subject and concluded:

> "As we have said, the implied reservation of the waters of this stream extended to so much thereof as was required to provide for the *reasonable needs of the Indians*, not merely as those needs existed in 1908, but as they would be measured in 1915, when the Indian ditch system had been completed." 236 F. 2d at 337.

The court also said:

> "It is unnecessary to consider whether, had there been no 1908 agreement, the rights of the government as trustee for the Indians would have been constantly growing ones in the years following 1915 had the irrigable area within the reservation continued to increase. It is sufficient for the purposes of this case to say that an adjudication of the rights of the United States in and to the waters of Ahtanum Creek as of 1915, would necessarily award the United States a right measured by the needs of the Indian irrigation project at that date." 236 F. 2d at 328.

Thus, the *Ahtanum* case did not approve the irrigable acreage test used by the Special Master. Instead, it held that the extent of the reserved right was sufficient water for use on the Indian irrigation project, as it was developed in 1915, and declined to say whether this right would be enlarged by bringing additional land into the project.

The needs of the Indians, rather than a determination of the amount of water necessary to irrigate all the irrigable acres, was the test applied in *United States* v. *Walker River Irrigation Dist.*, 104 F. 2d 334 (9th Cir. 1939). There the United States sued to restrain the defendants "from interfering with the natural flow of the stream, to the extent of 150 cubic feet per second to and upon" the Reservation. As the Court of Appeals stated, "the tillable lands reserved have an area of approximately 10,000 acres". 104 F. 2d at 335. The court explicitly rejected irrigable acreage as the measure of the Indian needs, stating:

> "The area of irrigable land included in the reservation is not necessarily the criterion for measuring the amount of water reserved, whether the standard be applied as of 1859 or as of the present. The extent to which the use of the stream might be necessary

could be demonstrated only by experience." 104 F. 2d at 340.

The Court further found that water had been reserved "to the extent reasonably necessary to supply the *needs of the Indians*". 104 F. 2d at 339-40.

The "experience" which the court considered consisted of (1) cultivated acreage data showing an increase from 1,900 acres in cultivation in 1886 to about 2,000 acres when the suit was filed some 50 years later; and (2) statistics as to the Indian population of the Reservation and the number of Indians actually engaged in farming.

Based on this evidence, the report of the Master in that case, which was accepted by the Court of Appeals, concluded that "the number of Indians is not increasing and it has not been shown that there is the necessity or demand for the cultivation of a larger area than 2,100 acres". 104 F. 2d at 340. Relying on this finding, the court entered a decree awarding the Government 26.25 cubic feet per second during the 180-day irrigation season for the irrigation of 2,100 acres of land on the Reservation, together with the flow reasonably necessary for domestic and stock-watering purposes and for power purposes to the extent then used by the United States during the non-irrigating season. Thus, the court limited the Indians' water rights to their existing and reasonably foreseeable needs as shown by past experience and rejected the irrigable acreage test.

Before the Master here the Government cited *Skeem* v. *United States*, 273 Fed. 93 (9th Cir. 1921) as authority for its contention that, "when an Indian reservation is set apart, the water right thereby reserved is large enough to irrigate the entire irrigable acreage of the reservation". No such holding was made in that case.

In *Skeem*, the court was considering the effect of a Reservation created by an 1898 treaty, which provided:

> "The water from streams on that portion of the reservation now sold which is necessary for irrigating on land actually cultivated and in use shall be reserved for the Indians now using the same, so long as said Indians remain where they now live."[82]

The court rejected the contention that this limited the Indians to the quantity of water being used in 1898, since the grant was one *by* the Indians and not *to* the Indians, so that all rights not specifically granted were reserved by the Indians. The decision was not a determination by the court that a water right which has been reserved by implication is to be measured in terms of irrigable acreage. Rather, the court construed the treaty provision to mean that the Indians themselves were retaining a right to sufficient water to irrigate all the irrigable lands withheld by them. Hence, the case is not authority for the proposition that the extent of the rights of the Reservations here involved, which at most could only have come into being by implication, is to be determined by the irrigable acreage criterion.

In addition, the principal question before the court in *Skeem* was whether the leasing of his land by an Indian allottee operated to relinquish a reserved water right. The court held that it did not.

Thus, none of the cases cited by the Special Master holds that the setting aside of lands for an Indian Reservation in itself operates by implication to reserve water for every irrigable acre. In fact, the court in each instance rejected that test and held that the quantity of water reserved by implication was to be determined by the needs of the Indians.

---

[82] 31 Stat. 672, 674 (1900).

In each case where the implied reservation theory has been applied, the court has determined the quantity of water reserved for the Indians on the basis of the particular facts and circumstances involved. In no case did the court use irrigable acreage as the criterion. Instead, the attempt has been made to determine the needs of the Indians and this has usually been done by looking to past experience as a guide.

In *Winters* the court awarded water for the irrigation of 5,000 out of 30,000 irrigable acres. In *Conrad* the court looked to present use and in the *Walker River* case the reasonable needs of the Indians as shown by past experience were adopted as the standard. In *Ahtanum* the extent of the reserved right was held to be sufficient water for the Indian irrigation project as it existed in 1915. In *Powers* quantity was not in issue and was not determined.

Undoubtedly, in a proper case, a court might conclude that to satisfy the needs of the Indians it is necessary to set aside water for all the irrigable acreage on the Reservation. Arizona takes this view with respect to the Cocopah Reservation (see p. 190, *infra*). Such a situation might also arise if there were a large number of Indians on a Reservation with limited irrigable acreage. But that certainly is not the case here, where there are only a few Indians who depend for a livelihood on the acreage of the Colorado River Indian Reservation and no Indians who occupy the Arizona portion of the Fort Mohave Indian Reservation.

The historical facts relating to these Reservations demonstrate the inequities which would result from the test applied by the Special Master and the necessity for taking the needs of the Indians as the measure of the quantity of water reserved.

(1) Fort Mohave Indian Reservation

The Special Master has found that there are 14,916 acres of irrigable land on the Fort Mohave Indian Reservation in Arizona which, together with related uses, have a maximum annual diversion requirement of 96,416 acre-feet (Rep. 281). He has concluded that the United States has the right to divert this quantity of water from the Colorado River for use on this land (Rep. 283). When considered in the light of the history of the Reservation, this conclusion cannot be supported.

The so called "Fort Mohave Indian Reservation" was originally created as a military post and later transferred to the Department of the Interior to be used as an industrial training school for Indian youth. Additional land was set aside for the Mohave Indians in 1911 (p. 149, *supra*). The United States, as will be demonstrated, has abandoned any plans to develop an irrigation project on this Reservation.

No land is being irrigated on the Reservation at the present time (US 1302; Tr. 14072) and the maximum ever irrigated successfully is 23 acres (US 1320; Tr. 14000-01). The Mohave Indians are obviously not interested in farming for a livelihood since they live off the Reservation in Needles, California, where most of them are employed by the Santa Fe Railroad (Tr. 13764, 13917, 14220-22). In fact, none of these Indians resides within the Arizona or California portions of the Reservation and only one Indian family lives in the Nevada section (Tr. 14101-02). Yet, the Special Master has held that the United States has the right to divert almost 100,000 acre-feet per annum out of Arizona's share of Colorado River water for use in an area where no Indians live and where no farming operations are carried on.

In addition, the record establishes that no major irrigation project has ever been contemplated for the Fort Mohave

Indian Reservation. To the contrary, it has long been recognized that any such project is impracticable.

In his 1903 Report the Commissioner of Indian Affairs noted that "evidently a number of years ago nearly all the Indians who are now at Needles lived upon the overflow lands between Fort Mohave and Needles, but a failure of the Colorado River to overflow for a succession of years forced these Indians to seek employment on the railroad and in the shops at Needles" (US 1310). In the same report the Commissioner stated that "the school has irrigated by means of centrifugal steam pump the same lands that have been under cultivation by the school for a number of years".

In the 1912 Annual Report of the Department of the Interior it was said regarding the Fort Mohave Reservation: "There are well known and much discussed obstacles to a successful irrigation system on the lands of this Reservation. These are probably not insurmountable, and it would be of great benefit to the Indians to know, as soon as possible, whether it is to be the policy of the Government to attempt to install this system, or to make other provision for them" (US 1311, p. 25).

The 1915 Report of the Department noted that "few improvements of a permanent character have been made and but little farming done" and that although a portion of the lowlands along the Colorado had been allotted to the Mohaves, many of the allotments had been entirely destroyed by the frequent changes in the main channel of the river (US 1313, p. 88). The Report expressed the view that the expense involved in making the necessary improvements "would not be justifiable", and that, in any event, "representations have been made with a view to the removal of these Indians, or at least having them take allotments on lands not subject to overflow and which can be irrigated on the Colorado River Reservation, at Parker". The Report

added that this idea was being received favorably by some of the Indians, several of whom had gone to Parker, and added: "It seems best to encourage this irrigation and the surest way to do so will be to make no further attempt tc protect the lands at Fort Mohave, inasmuch as it has been fully demonstrated that this cannot be done with any assurance of permanence" (US 1313, p. 89).

The 1919 Report of the Department stated that 20 acres were then irrigated, that "the abandonment of this school has been contemplated, and until this matter is settled, no permanent irrigation work could well be undertaken" (US 1314).

As late as 1939, the Interior Department's Assistant Director of Irrigation reported to the Director, after reviewing the history of irrigation on the Fort Mohave Reservation, that:

> "There is no irrigation project on this reservation and prospects for developing a feasible project are not encouraging. . . ." (US 1315)

A so-called "Long Range Program" of irrigation for the Fort Mohave Reservation was referred to in a report to the Director of Irrigation dated January 29, 1944, which stated that as of that date "there is no irrigation project on this reservation. A small acreage near the school was irrigated by pumping for many years subsequent to 1891 until the school was abandoned." The report concluded:

> "Many of the Fort Mohave Indians have been allotted tentatively under the Colorado River Irrigation Project and under present conditions no plans are being considered for an irrigation project on the Fort Mohave Reservation. . . ." (US 1316)

Under § 4 of this same report there is this significant notation:

> "SECTION 4—SERVICES PROVIDED BY GOVERNMENT
>
> *Irrigation*
>
> None since early efforts to construct a small project."

In this history, covering a period of more than 70 years, we can find no justification for setting apart for the Fort Mohave Indian Reservation water of the Colorado River sufficient to irrigate 14,916 irrigable acres of Reservation land in Arizona or to meet an annual diversion requirement of 96,416 acre-feet, whichever is less (Rep. 281). To the contrary, we believe the entire history of irrigation on this Reservation evidences a purpose on the part of the United States *not* to irrigate this land on the ground that to attempt to do so would not be feasible. The Reservation was not originally established for agricultural purposes, but for use as a training school (pp. 148-49, *supra*). The school has long since been abandoned. The land set apart has never in any real sense been devoted to farming or related uses. Actually, the Mohaves themselves have abandoned the Reservation and no land is under cultivation.

For these reasons, the setting aside of such a substantial part of Arizona's share of Colorado River water for use on the Fort Mohave Indian Reservation can be of no benefit to the Indians. They are not farmers but live on wages from employment in Needles, California. None of them has shown a desire to live on the Reservation in Arizona or to engage in farming. To sustain the Master's holding would be to award a large quantity of water in perpetuity to this Reservation to the detriment of other areas in Arizona where additional water is so desperately needed (pp. 21-22, *supra*).

(2) Colorado River Indian Reservation

The Special Master has found that there are 99,375 acres of irrigable land in the Arizona section of the Colorado River Indian Reservation which, together with related uses, have a maximum annual diversion requirement of 662,402 acre-feet (Rep. 272). He has concluded that the United States has the right to divert that quantity of water from the Colorado River for use on the Reservation in Arizona (Rep. 273-74).

This conclusion is based upon the Master's holding that the United States, when it created this Reservation, had impliedly reserved sufficient water to irrigate all the irrigable acreage within the Reservation. As a result, there will be set apart from use by the general public a large quantity of water in perpetuity when no such amount has ever been used and in all likelihood never will be used on this Reservation. The facts make evident that the holding of the Master cannot benefit the Indians but will only result in depriving other areas in Arizona of water which is vital to the existing economy of the state.

The Colorado River Indian Reservation was created at the recommendation of the Commissioner of Indian Affairs to consolidate on one large Reservation a number of Indian tribes previously inhabiting numerous small Reservations scattered throughout the Southwest (US 512, p. 21). However, since the establishment of the Reservation in 1865, there has been only very limited success in relocating on it members of tribes which traditionally inhabited areas along the Colorado River.

The Yuma Indians never left their tribal home near Yuma, Arizona (US 526, p. 284; US 530). As a result, the Yuma Indian Reservation was established by executive order of January 9, 1884 for the Yumas and such other

Indians as the Secretary of the Interior might see fit to settle thereon (US 1101).

Of the estimated 2,000 Yavapais or Mohave-Apaches (US 521), only 17 were on the Colorado River Indian Reservation in July 1870 (US 522). None of these Indians was thereafter reported as being on this Reservation and they are now located on the Camp Verde Reservation, acquired through purchase by the United States, and on the Fort McDowell Indian Reservation, created by executive order on September 15, 1903 (US 2303).

Some members of the Chemehuevi tribe were living on the California portion of the Colorado River Indian Reservation in 1874 (US 530) but by 1890 all had returned to the Chemehuevi Valley about 30 miles north of the Reservation (US 539). A part of this valley was set aside as the Chemehuevi Indian Reservation by order of the Secretary of the Interior on February 2, 1907 (US 1201).

Similar attempts to locate the Hualapais on the Colorado River Indian Reservation also met with complete failure. In September 1867, 150 members of this tribe moved there but "... clandestinely left the reservation on the night of the 13th of March, and probably rejoined their former wild companions in the interior" (US 518, pp. 137-38). A report of the Commissioner of Indian Affairs indicates there were 620 Hualapais on the Reservation in 1874 (US 527, p. 61) but in 1875 "... they went off the reservation to their old range, saying they would not work or return to the reservation ..." (US 530) and they never returned (US 539). A separate reservation was created for this tribe by executive order on January 8, 1883 (US 801). See *United States* v. *Santa Fe Pacific R. R.*, 314 U. S. 339 (1941).

The resettlement of the Mohave Indians on the Colorado River Indian Reservation has been somewhat less unsuccessful. By 1867, approximately 750 of an estimated

4,000 members of this tribe had moved to the Colorado River Indian Reservation (US 516, p. 156) and in 1868 the number had increased to 2,000 (US 518, p. 137). However, only about 800 Mohaves were still there in 1869 (US 520, p. 205), 695 in 1870 (US 522, p. 116) and 830 in 1874 (US 527, p. 61). By 1890, the number of Mohaves living on the Reservation had dwindled to 640, while there were 667 at Needles and 410 at Fort Mohave (US 539, p. 2).

The Indian Agent at the Colorado River Agency reported in 1898 that "of the five tribes originally allotted to this reservation only one section of the Mohave tribe have ever been induced to locate permanently upon it. These number 683; of the remaining Mohaves, nearly all live from 80 to 125 miles above the reservation in the vicinity of Needles, Cal., and Fort Mohave, Ariz." (US 543, p. 111)

The effect of the failure of this resettlement program was before the Court in *United States* v. *Santa Fe Pacific R. R., supra,* where the history and purpose of the Act of March 3, 1865,[83] which created the Colorado River Reservation "for the Indians of said river and its tributaries", was reviewed and the intent of Congress in creating the Reservation was stated. The Court held that the Indians referred to in the Act included the Hualapais, 314 U. S. at 351 and said:

> "We search the public records in vain for any clear and plain indication that Congress in creating the Colorado River reservation was doing more than making an offer to the Indians, including the Walapais [Hualapais], which it was hoped would be accepted as a compromise of a troublesome question." 314 U. S. at 353.

[83] 13 Stat. 559.

The Court continued:

> "Furthermore, the Walapais did not accept the offer which Congress had tendered. In 1874 they were, however, forcibly removed to the Colorado River reservation on order from the Indian Department. But they left it in a body the next year. And it was decided 'to allow them to remain in their old range during good behavior.' They did thereafter remain in their old country and engaged in no hostilities against the whites. No further attempt was made to force them onto the Colorado River reservation, even though Congress had made various appropriations to defray the costs of locating the Arizona Indians in permanent abodes . . . including the Colorado River reservation. . . . On these facts we conclude that the creation of the Colorado River reservation was, so far as the Walapais were concerned, nothing more than an abortive attempt to solve a perplexing problem." 314 U. S. at 354-55 (footnotes omitted).

The Court noted that in 1881 the Hualapais expressed a desire for the creation of a separate reservation for their benefit and that this was recommended by the Army, and said:

> "Pursuant to that recommendation, the military reservation was constituted on July 8, 1881, subject to the approval of the President. The Executive Order creating the Walapai Indian Reservation was signed by President Arthur on January 4, 1883. There was an indication that the Indians were satisfied with the proposed reservation. A few of them thereafter lived on the reservation; many of them did not. While suggestions recurred for the creation of a new and different reservation, this one was not abandoned. For a long time it remained unsurveyed. Cattlemen used it for grazing and for some years the Walapais

> received little benefit from it. But in view of all of the circumstances, we conclude that its creation at the request of the Walapais and its acceptance by them amounted to a relinquishment of any tribal claims to lands which they might have had outside that reservation and that that relinquishment was tantamount to an extinguishment by 'voluntary cession' within the meaning of §2 of the Act of July 27, 1886." 314 U. S. at 357-58 (footnotes omitted).

Thus the Court has expressly held that as far as the Hualapai Indians are concerned the creation of the Colorado River Reservation failed to accomplish its purpose and was no "more than an abortive attempt to solve a perplexing problem".

It is doubtful that, in the creation of the Colorado River Indian Reservation, Congress intended that it should serve as the home for any Indians except the five tribes: the Hualapais, Yumas, Yavapais, Chemehuevis and the Mohaves (see p. 111, *supra*). These Indians (with the exception of about one-third of the Mohave tribe) refused to live on the Colorado River Indian Reservation and ultimately other Reservations were created elsewhere for their benefit.

From time to time the United States created other and separate Reservations for the use and benefit of other Indian tribes in Arizona, as follows:

Gila River	Act of Congress	February 28, 1859	(US 1801)
Navajo	Treaty	June 1, 1868	(US 201)
Fort Apache	Executive Order	November 9, 1871	(US 2401)
San Carlos	Executive Order	November 9, 1871	(US 2001)
San Xavier	Executive Order	July 1, 1874	(US 1701)
Salt River	Executive Order	January 10, 1879	(US 2102)
Havasupai	Executive Order	June 8, 1880	(US 701)
Gila Bend	Executive Order	December 12, 1882	(US 1401)
Hopi	Executive Order	December 16, 1882	(US 401)
Kaibab	Executive Order	October 16, 1906	(US 602)
Papago	Executive Order	May 28, 1912	(US 1501)
Ak Chin	Executive Order	May 28, 1912	(US 1501)
Cocopah	Executive Order	September 27, 1917	(US 1001)

It would not be reasonable to conclude that each of these many Indian tribes is entitled to the benefit of water in two places, *i.e.*, the Reservation of their choice and the Colorado River Indian Reservation where they have refused to live. Instead of the more than 10,000 Indians contemplated by Congress in 1865, by 1900 less than 700 had elected to make this Reservation their permanent home. The record indicates that approximately 1,100 Indians reside on this Reservation at the present time (Rep. 86; C 2606). We cannot find any basis for concluding that there is a right to irrigate lands in the Colorado River Indian Reservation for Indians and Indian tribes who for more than ninety years have successfully resisted all efforts to move them there.

More than fifty years ago Congress itself recognized that attempts to colonize the Colorado River Indian Reservation had failed and that the area originally set aside for the Indians was excessive. By Act of April 21, 1904,[84] the Secretary of the Interior was authorized to include the Yuma and Colorado River Indian Reservations in any reclamation project which might make possible the reclamation of the Indian lands:

> "... *Provided,* That there shall be reserved for and allotted to each of the Indians belonging on the said reservations five acres of the irrigable lands. *The remainder of the lands irrigable in said reservations shall be disposed of to settlers under the provisions of the reclamation Act. . . .*"

The Act of March 3, 1911,[85] increased the allotment to ten acres of irrigable land per Indian but again provided that the surplus lands should be sold to pay the cost of irrigating the allotted lands.

---

[84] 33 Stat. 224.

[85] 36 Stat. 1063.

The 1912 annual report of the U. S. Indian Irrigation Service (US 547, p. 7) stated that "there will be about 500 allotments of ten acres each or about 5,000 acres to be irrigated in this project . . ." This in effect was an administrative finding that no more than 500 Indians resided on the Reservation at that time.

The fact that Congress, in the Act of April 21, 1904, the Act of April 4, 1910, the Act of March 3, 1911 and appropriation acts from 1910 through 1942 (pp. 142, 144-47, 175, *supra*), provided that the funds expended should be reimbursable from the sale of surplus lands of the Reservation, plainly indicates that Congress recognized that most of the Indians for whom the Reservation had been originally created or thereafter enlarged had rejected the congressional offer of that Reservation as a tribal home and that therefore lands above the needs of the Indians resident on the Reservation were surplus and should be sold.

The Government contended before the Master that, by the Navajo-Hopi Rehabilitation Act of April 19, 1950,[86] Congress has "reaffirmed" its intent expressed in the Act of March 3, 1865 to maintain the Colorado River Indian Reservation for the use of Indians of the Colorado River and its tributaries.

The record supports the conclusion that neither the Navajos nor the Hopis were among the tribes for which the Reservation was created (1 p. 110-11, *supra*). Of course, the Navajo-Hopi Rehabilitation Act of April 19, 1950 could not "reaffirm" a congressional intent which never existed.

In any event, the rehabilitation program authorized by the Act has now expired. Section 2 of the Act provides:

> "The foregoing program . . . shall be prosecuted in a manner which will provide for completion of the

[86] 64 Stat. 44, 25 U. S. C. §§631-40 (1958).

program, so far as practicable, within ten years from April 19, 1950."[87]

Even prior to the expiration of the authority conferred by the Act, the project of relocating members of the Navajo and Hopi tribes on the Colorado River Indian Reservation had failed. No Navajos or Hopis were settled on this Reservation after 1957.[88]

From 1945 to 1958 a total of 149 Navajo, Hopi and Supai families were relocated on the Colorado River Indian Reservation. By June 30, 1958, only 67 of these families remained.[89]

Although Congress authorized the expenditure of $5,750,000 for the resettlement program,[90] by 1956 only $2,939,750 had been appropriated for this purpose and after 1956 no further funds were appropriated for resettlement of these Indians on the Reservation.[91]

Among the reasons which have been assigned for the failure of this resettlement project are both domestic and health problems, as well as inability to adjust to high summer temperatures and the agricultural techniques and managerial requirements necessary for successful irrigation farming.[92]

In addition, by the Navajo Treaty of 1868 [93] the Navajos agreed not to leave their Reservation under penalty of forfeiture of all rights, privileges and annuities conferred by the treaty.

[87] 64 Stat. 45 (1950), 25 U. S. C. §632 (1958).

[88] Navajo Yearbook, 1958 (Report No. VII) p. 89; Navajo Yearbook, 1957 (Report No. VI) p. 80.

[89] Navajo Yearbook, 1958 (Report No. VII) p. 89.

[90] 64 Stat. 45 (1950), 25 U. S. C. §631(6) (1958).

[91] Navajo Yearbook, 1957 (Report No. VI) p. 79.

[92] Navajo Yearbook, 1958 (Report No. VII) pp. 89-90.

[93] 15 Stat. 667.

It was stated by Secretary of the Interior J. A. Krug in his report to Congress in connection with the Navajo-Hopi Rehabilitation Act:

> "Another reason why many of the Navajos do not wish to leave the reservation stems from Article 13 of the Treaty of 1868. . . . Aside from the ironical fact that this section of the treaty was designed to prevent the very thing—off-reservation movement which is now deemed essential, many of the Navajos believe that the tribe may in future realize substantial benefits from tribal assets, such as oil, coal, or helium, and they do not wish to relinquish their share of such future benefits or other rights, present or future, which they possess as members of the Navajo Tribe."[94]

That this reluctance is well-founded appears from the record (Tr. 13937):

> "The Navajo tribal income for the fiscal year 1955 was $4,215,264. For the fiscal year 1956, $3,988,570. For the fiscal year 1957, $36,951,185.
>
> "The Navajo treasury balance as of June 30, 1957, was $50,780,450.11. The Navajo tribal budget for the fiscal year 1958 was $12,301,231."

Recent public announcements indicate the surface has only been scratched and that the Navajos face a very bright future on their own Reservation. Unanticipated riches accruing to the Navajos from uranium, petroleum, and other minerals plus the industrial and general development of the Reservation has removed both the need and the incentive for resettlement on the Colorado River Indian Reservation.

---

[94] Hearings Before a Subcommittee of the Senate Committee on Interior and Insular Affairs on S. 2363, 80th Cong., 2d Sess. 499 (1948).

The conclusion is warranted that there is neither equity nor reason in the proposal that the 107,588 irrigable acres of the Colorado River Indian Reservation be developed and supplied with irrigation water as a windfall for the benefit of the relatively few Indians who have made this Reservation their home.

It is impossible to ascertain from the record just how many Indians actually are living on the Reservation. Responsible government officials who should know were, to say the least, indefinite in their testimony. California Exhibit 2600-7, prepared by the United States but placed in evidence by California, does not deal with Indians actually resident on the Reservation. It is difficult to understand why the Government measured each "irrigable" acre of every Reservation with meticulous care, painstakingly surveyed the soil types and compiled a great mass of engineering data as to irrigability of land, and yet wholly neglected the most important fact—the number of Indians resident on the Reservation who are dependent upon farming of Reservation land for their livelihood. However, the Master estimated that 1,100 or 1,200 of the 1957 tribal population of approximately 1,300 live on the Reservation (Rep. 86).[95]

The evidence shows that in 1949, there were 22,315 acres in cultivation on the Colorado River Indian Reservation and in 1954 a maximum of 29,957 acres (US 575). During 1955, the last year for which there is any evidence, there were 29,271 acres in cultivation (US 575) out of a total of 107,588 acres found by the Master to be irrigable (Rep. 272).

---

[95] The Master's estimate is substantially in agreement with population figures issued by the Department of the Interior late in 1960. Department of the Interior, United States Indian Population and Land 6 (1960).

In recent years the acreage actually farmed by the Indians has decreased. In 1953 the Indians farmed 18,719 acres, whereas 10,815 acres were farmed by non-Indian lessees and others (US 556, p. 7). In 1954, there were 15,153 acres farmed by the Indians and 14,804 acres by non-Indian lessees and others (US 556, p. 4). In 1955, the Indians farmed less than half the land cultivated on the Reservation. The acreage farmed by them in that year was 14,512 acres as compared to 14,759 acres farmed by non-Indian lessees and others (US 556, p. 1). In like manner, the number of Indians actively farming land on the Reservation has dropped from a maximum of 276 in 1951 to 148 in 1957, the last year of record (C. 2642). If this trend continues, the Indians will soon have the status of absentee landlords, a situation which was not contemplated by Congress when it created the Reservation nor when it appropriated funds to enable the Indians to make a livelihood by farming Reservation lands.

Presently irrigated acreage is sufficient for more than a 100% increase of use by the Indians farming on the Reservation. More than adequate provision has now been made for Indians living on this Reservation. With approximately 80% of the lands in Arizona in public ownership and hence non-taxable, she strenuously objects to diverting, for a non-taxpaying economy, water urgently needed to support the portion of her economy which is taxpaying.

One government witness testified that there are 40,000 acres ready for cultivation on the Colorado River Indian Reservation and that practically all of this land had been farmed at one time or another (Tr. 14098-99). This is substantially more than two and one-half times the 14,500 acres presently farmed by the Indians and therefore allows more than 25,000 acres for any future increase in need.

We suggest that allowance of a sufficient water supply to irrigate and farm this 40,000 acres would be more than adequate to provide for the present and reasonably foreseeable future needs of the Indians of this Reservation.

VI

Should the Court find there was no reservation of water for use on Indian Reservations, or, should the Court find such a reservation of water but reject Indian needs as the test of the quantity reserved, the amount of water to which the Reservations are entitled should be determined in accordance with principles of equitable apportionment.

If the Court should agree with our position, set forth earlier (pp. 121-53, *supra*), that the acts creating and enlarging the various Reservations were ineffective to reserve Colorado River water as well as land, we suggest that the extent of present day Reservation water rights should be determined by the application of principles of equitable apportionment akin to those used by this Court in resolving interstate water rights controversies.

Even if the Court should find that the acts creating and enlarging the Indian Reservations here in question were effective to reserve sufficient water to irrigate all the irrigable acreage in the Reservations, we again urge that the measure of the Reservation rights to water as against the rights of other users in Arizona be determined by application of principles of equitable apportionment.

Understandably, Arizona is reluctant to take a position adverse to any of her citizens. But since the Recommended Decree apportions to the Indians amounts of water far in excess of their needs, present and prospective, we

must urge the Court to modify this portion of it. We do not believe any class of citizens should be so favored at the expense of the other citizens of the state. Further, we believe that a commodity as precious to our area as water should be put to its most economical and efficient use, having equal regard for the rights and needs of all.

A. Status of Indian Tribes as Quasi-Sovereigns

Although the Indian tribes or "nations" are not sovereign in the sense that the several states are sovereign, *Cherokee Nation* v. *Southern Kansas Ry.*, 135 U. S. 641 (1890), nevertheless "in the executive, legislative and judicial branches of our government we have admitted, by the most solemn sanctions, the existence of the Indians as a separate and distinct people, and as being vested with rights which constitute them a state or separate community". *Worcester* v. *Georgia,* 31 U. S. (6 Pet.) 515, 583 (1832) (concurring opinion).

This Court has also considered Indian tribes as states in a certain sense. In *Holden* v. *Joy,* 84 U. S. (17 Wall.) 211, 242 (1872) it was said:

> "Indian tribes are states in a certain sense, though not foreign states, or states of the United States, within the meaning of the second section of the third article of the Constitution, which extends the judicial power to controversies between two or more states, between a state and citizens of another state, between citizens of different states, and between a state or the citizens thereof and foreign states, citizens or subjects. They are not states within the meaning of any one of those clauses of the Constitution, and yet in a certain domestic sense and for certain municipal purposes, they are states, and have been uniformly so treated since the settlement of our country and

> throughout its history, and numerous treaties made with them recognize them as a people capable of maintaining the relations of peace and war, of being responsible, in their political character, for any violation of their engagements, or for any aggression committed on the citizens of the United States by any individual of their community. Laws have been enacted by Congress in the spirit of those treaties, and the acts of our government, both in the executive and legislative departments, plainly recognize such tribes or nations as states; and the courts of the United States are bound by those acts."

The latest pronouncement by the Court with respect to the status of Indian tribes was made in *Williams* v. *Lee*, 358 U. S. 217 (1959), holding that the state courts of Arizona had no jurisdiction over a suit by a non-Indian trader, who operated a general store on the Navajo Reservation under a license from the Commissioner of Indian Affairs, against a Navajo Indian and his wife to collect for goods sold them on credit on the Reservation. Quoting from *Worcester* v. *Georgia*, 31 U. S. (6 Pet.) 515, 561 (1832), the Court stated:

> "'The Cherokee nation . . . is a distinct community, occupying its own territory . . . in which the laws of Georgia can have no force, and which the citizens of Georgia have no right to enter, but with the assent of the Cherokees themselves, or in conformity with treaties, and with the acts of congress. The whole intercourse between the United States and this nation, is, by our constitution and laws, vested in the government of the United States.'" 358 U. S. at 219.

The Court went on to say in *Williams* v. *Lee*:

> "Despite bitter criticism and the defiance of Georgia which refused to obey this Court's mandate in Worcester the broad principles of that decision came

> to be accepted as law. Over the years this Court has modified these principles in cases where essential tribal relations were not involved and where the rights of Indians would not be jeopardized, but the basic policy of Worcester has remained." 358 U. S. at 219 (footnotes omitted).

Thus the Court has consistently held that Indian tribes are at least quasi-sovereign and are not subject to the jurisdiction of state courts unless authority is expressly granted by Congress. *United States* v. *United States Fidelity & Guaranty Co.*, 309 U. S. 506 (1940).

Although the Special Master has held that uses by Indians of Colorado River water in Arizona are to be charged to Arizona's total entitlement (Rep. 247-48), the state has no jurisdiction to supervise this Indian use and therefore cannot take any steps to prevent waste of water or to insure that this water is put to economical and beneficial use. While Reservation Indians are citizens of the state, they are immune from the operation of state law. The reasons which impelled the Court to apply equitable apportionment principles in controversies between states are equally applicable in the allotment of Colorado River water between Reservation Indians in Arizona and the other citizens of the state.

Moreover, if a contest between sovereigns is a basic essential for an equitable apportionment of water, the contest here is between the United States, as representative of Reservation Indians and legal owner of Reservation lands, on the one hand, and the State of Arizona, on the other—two sovereign governments.

B. Applicability of Equitable Apportionment

The doctrine of equitable apportionment, as applied to interstate streams, has been developed by this Court in a

series of decisions beginning with *Missouri* v. *Illinois,* 180 U. S. 208 (1901). Throughout the period of this development the Court has regarded the doctrine as flexible and designed to do justice to the conflicting claims of adjoining states, when the asserted water rights of one state cannot be wholly satisfied without some injury to the other. Thus, principles of equitable apportionment have been applied to disputes between states in a case where both states adhere to the doctrine of prior appropriation, *Wyoming* v. *Colorado,* 259 U. S. 419 (1922), or when both follow the rule of riparian rights, *Connecticut* v. *Massachusetts,* 282 U. S. 660 (1931); and the doctrine has also been invoked when one state applies the riparian rule and the other the appropriation doctrine, *Kansas* v. *Colorado,* 206 U. S. 46 (1907). In *Kansas* v. *Colorado* the Court stated the essential principles underlying the doctrine of equitable apportionment thus:

> "One cardinal rule, underlying all the relations of the states to each other, is that of equality of right. Each state stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none. Yet, whenever, as in the case of *Missouri* v. *Illinois, supra,* the action of one state reaches, through the agency of natural laws, into the territory of another state, the question of the extent and the limitations of the rights of the two states becomes a matter of justiciable dispute between them, and this court is called upon to settle that dispute in such a way as will recognize the equal rights of both and at the same time establish justice between them." 206 U. S. at 97-98.

Again, in *New Jersey* v. *New York,* 283 U. S. 336, 343 (1931), Mr. Justice Holmes, speaking for the Court, stated:

> "The different traditions and practices in different parts of the country may lead to varying results but

> the effort always is to secure an equitable apportionment without quibbling over formulas."

The basic principle is stated as follows in *Colorado* v. *Kansas*, 320 U. S. 383, 393-94 (1943):

> "And in determining whether one state is using, or threatening to use, more than its equitable share of the benefits of a stream, all the factors which create equities in favor of one state or the other must be weighed as of the date when the controversy is mooted."

The latest equitable apportionment case decided by this Court was *Nebraska* v. *Wyoming*, 325 U. S. 589 (1945), where Mr. Justice Douglas summarized the holdings in the previous cases:

> "But if an allocation between appropriation States is to be just and equitable, strict adherence to the priority rule may not be possible. For example, the economy of a region may have been established on the basis of junior appropriations. So far as possible those established uses should be protected though strict application of the priority rule might jeopardize them. Apportionment calls for the exercise of an informed judgment on a consideration of many factors. Priority of appropriation is the guiding principle. But physical and climatic conditions, the consumptive use of water in the several sections of the river, the character and rate of return flows, the extent of established uses, the availability of storage water, the practical effect of wasteful uses on downstream areas, the damage to upstream areas as compared to the benefits to downstream areas if a limitation is imposed on the former—these are all relevant factors. They are merely an illustrative, not an exhaustive catalogue. They indicate the nature of the problem of apportionment and the delicate adjust-

ment of interests which must be made." 325 U. S. at 618.

Although the doctrine of prior appropriation has applied in Arizona ever since it was a part of Mexico, *Boquillas Land & Cattle Co.* v. *Curtis*, 213 U. S. 339 (1909), the United States has never attempted to establish the existence of appropriative rights in the Indian Reservations in question under territorial or state law. Therefore, the present controversy is not one between two appropriation states, as in *Wyoming* v. *Colorado, supra,* but involves the claims of a sovereign state which applies the appropriation rule on the one hand, and on the other the claims of a sovereign (United States) or a quasi-sovereign (Indian tribes) which does not rely upon principles of prior appropriation. Under these circumstances, we believe that in seeking a solution to this problem the Court must look to the other "relevant factors" referred to by Mr. Justice Douglas in *Nebraska* v. *Wyoming, supra.*

C. Equitable Considerations

The inadequate case made by the United States as to the Reservations here involved presented the Special Master with a difficult choice. Ignoring the plain teaching of the *Walker River* case, which is implicit in this Court's decision in *Winters*, that proof of present and prospective Indian needs controls the determination of the quantity of water allowed, even when the reservation theory is applied, the United States made no attempt whatever to show the number of Indians who are now or may be expected to be in the future dependent upon the Reservations for their livelihood nor the amount of water which is or will be reasonably required for their needs.

If the reservation theory, even as expanded by the Master, be accepted, nevertheless the water reserved is not insulated from the exercise by this Court of its equitable powers fairly to apportion it between the competing sovereigns. We can see no reason why rights predicated on the legal fiction of an implied reservation of water should be less subject to the Court's equitable powers than a right gained through actual application of water to beneficial use under state law. This Court has not hesitated in an equitable apportionment case to subordinate prior perfected rights to junior rights when warranted by the equities of the case. *Nebraska* v. *Wyoming, supra.* In fact, the Special Master here did this very thing in deciding the conflicting claims to water of the Gila River System (Rep. 324-30).

We suggest that the following "relevant factors" should be considered in arriving at an equitable apportionment between Reservation Indians and other water users in Arizona.

(1) Fort Mohave Indian Reservation

As we have seen, no Indians presently reside on the Arizona portion of this Reservation nor are there plans to settle any there (pp. 166-69, *supra*).

The soil survey of the Fort Mohave Indian Reservation (US 1318, 1321) discloses that, of the total acres within Arizona which are classified as "irrigable", 4,775 are Class IV lands and 7,600 acres are Class III lands.[96] In other

---

[96] Classes III and IV were described as follows (C 2606, pp. 8-9; Tr. 13854-55):

> "CLASS III—Moderately good land that can be used regularly for crops in a good rotation but needs intensive treatments; or complex farming practices for permanent use; subject to severe limitations in use or severe risks of

words, of the 14,916 acres of Reservation land in Arizona found by the Master to be irrigable (Rep. 281), over 12,000 are either "subject to severe limitations in use" (Class III), or can only "be cultivated occasionally" (Class IV).

Further, a great percentage of the Fort Mohave Reservation lands in Arizona which are classed as irrigable are "checkerboard" holdings (US 1318) with alternate sections in private ownership (pp. 149-50, *supra*). This crazy-quilt pattern of ownership necessarily makes development of the lands difficult and expensive.

(2) Colorado River Indian Reservation

On the Colorado River Indian Reservation, large acreages are also marginal. Of the aggregate of 107,588 acres of irrigable land within the Reservation as found by the Master (Rep 272), there are 32,626 acres in Class III and 26,670 acres in Class IV (US 561). In addition, mesa land is widely interspersed with nonirrigable land (US 561), rendering irrigation difficult and expensive. The present uses and development on this Reservation (pp. 179-80, *supra*) are more than adequate for the reasonable needs, present and foreseeable, of its Indian occupants. Indeed,

---

damage, because of permanent land characteristics. Examples of Class III are: moderately steep slopes, high susceptibility to erosion, excessive wetness, moderate to severe alkali and salinity, shallow to inhibitory layers, very heavy or very light textures, and low inherent fertility.

"CLASS IV—Fairly good land that is best maintained in perennial vegetation, but can be cultivated occasionally, if handled with great care; subject to very severe permanent limitations or hazards in use for cropland. Examples of Class IV lands are: Steep slopes, very high susceptibility to erosion, excessive wetness or continuing hazards of water-logging, very light and coarse to very heavy textured soil profiles, very shallow and very low inherent fertility."

the Indians themselves are farming less than 40% of the approximately 40,000 acres which historically have been irrigated (p. 180, *supra*). Thus, the presently irrigated acreage will permit more than a 150% increase in Indian use to meet any expansion in need that may occur.

(3) Cocopah Indian Reservation

The Special Master has found that there are 431 irrigable acres in the Cocopah Indian Reservation, which, together with related uses, have a maximum annual diversion requirement of 2,744 acre-feet (Rep. 268). He has also found that the 1957 population of the tribe was about 90 Indians (Rep. 88).

It so happens that the irrigable acreage criterion, as applied to this Reservation, will not result in allotting to these Indians a quantity of water exceeding their needs.

(4) Non-Indian Needs in Arizona

The needs of non-Indian users in Arizona are such that every drop of available water must be conserved and put to beneficial use. Arizona of necessity must rely on the Colorado River for water not only to preserve its existing economy but to meet the mounting needs of its exploding population.

In 1956, during the hearings before the Master, Arizona's population was estimated at 1,060,000. Phoenix then had an estimated population of 165,000 and Tucson 85,000 (A 134, p. 7). It was expected that by 1965 the state's population would increase to 1,500,000 (Tr. 1020). However, as the 1960 census shows, the state's population is 1,302,161 the population of Phoenix is 439,170 and that of Tucson 212,892. Arizona ranks first in the nation in all major cat

gories of percentage growth in population since World War II (Tr. 1014; A 134). Unquestionably, her population will far exceed the 2,000,000 predicted in 1956 for 1975 (Tr. 1020).

Water must be provided not only for the domestic needs of this multitude of new citizens but also to meet the demands of the gigantic industrial growth which is taking place.

Taking one year as an example, in 1955 Arizona's agricultural, manufacturing and mining industries grossed over one billion dollars (Tr. 1021). Retail sales also exceeded one billion (Tr. 1021-22) and there was over $300,000,000 in new construction (Tr. 1022). Present day statistics would undoubtedly show further growth in these areas proportionate to the population increase established by the 1960 census.

While the economy of the state has been thus booming, the water supply has been becoming increasingly inadequate. In 1952, there were 923,000 acres in irrigated cultivation in Maricopa and Pinal Counties and in the Safford, Duncan and San Pedro areas, which comprise the major irrigated areas of the state, except for Yuma County, which has access to the main stream of the Colorado River for its water supply. In 1955, this irrigated acreage had decreased to 822,000 acres. Approximately 50,000 acres have been going out of cultivation yearly due to falling water tables. Unless a supplemental water supply is found, another 300,000 acres will go out of cultivation (Tr. 1483).

Since 1940 the water table has dropped in the Salt River Valley basin, the major irrigated area in the state utilizing both surface and ground water, an average of 68 feet (Tr. 1292). In the Eloy area in Pinal County it has dropped 85 feet (Tr. 1278) and in the Maricopa-Stanfield area 80 feet (Tr. 1280). From 1930 to 1954, there was a drop of

82 feet in the Mesa, Chandler, Tempe Area (Tr. 1290) and 85 feet in the Queen Creek, Higley, Gilbert area (Tr. 1290).[97] Other areas have suffered lesser lowering of the water table but it has been substantial in all irrigated areas (Tr. 1299-1300).

When the water required for salt balance is added to the problem of inflow required to satisfy the needs of these areas, the emergency which confronts Arizona becomes even more serious. Presently there is available no water to maintain salt balance. If it is not provided, large additional acreages in the lower end of the Salt River Valley basin will ultimately be "salted out" (Tr. 1283, 1295).

Surely, in the face of this grave situation, it is not without good reason that Arizona urgently requests the Court to consider and weigh the needs of all her citizens, Indians and non-Indians alike, to counter-balance the genuine water requirements of each, and, in measuring the extent of the rights of Reservation Indians in Colorado River water, to make an apportionment that is truly equitable—that is, an allowance of an amount of water, but no more than the amount, that will serve to meet adequately the present and reasonably foreseeable needs of the Indians themselves.

VII

In withdrawing public lands for the Gila National Forest the United States did not reserve water from the Gila and San Francisco Rivers for use in the forest.

The right of the United States to use the water of the Gila and San Francisco Rivers for the purposes of the Gila National Forest is the only disputed item in the disposition

[97] A 116 shows the geographical location of these areas.

of the claims made by Arizona, New Mexico and the United States to the water of the Gila River System (A Exc. 29-30) (pp. 5-6, *supra*).

The Special Master found that the Gila National Forest was created by presidential proclamation dated March 2, 1899 and enlarged and modified by later proclamations (Rep. 342). Since there was evidence that the United States diverts water for the Gila National Forest from the main stream of the Gila and San Francisco Rivers, the Special Master held that the claims of the United States with respect to its right to divert water for the purposes of this federal establishment should be decided. Although the Master found that there is not sufficient evidence from which to make a determination of the ultimate water requirements of the Gila National Forest (Rep. 342), he did find that in withdrawing lands for the Gila National Forest the United States intended to reserve rights to the use of so much water from the Gila and San Francisco Rivers as might be reasonably needed to fulfill the purposes of the forest (Rep. 342). He concludes that the United States has the right to divert water from the main stream of the Gila and San Francisco Rivers in quantities reasonably necessary to fulfill the purposes of the Gila National Forest with priority dates as of the date of withdrawal for forest purposes of each area of the forest within which the water is used (Rep. 343). He also holds that those rights in the Gila River System which are recognized by the Recommended Decree, to the extent that they are junior in time, are subordinate to the rights of the United States to divert water for the Gila National Forest (Rep. 335).

The Special Master reasons that the purposes of the forest cannot be fulfilled without an adequate water supply and hence that the United States must have intended to

reserve water in quantities reasonably necessary to fulfill the purposes for which the forest lands were withdrawn (Rep. 335). He then concludes that the power of the United States to make this reservation of water "cannot be logically differentiated from the power of the United States with respect to Indian Reservations and Recreational Areas" (Rep. 335).

Although Arizona is not in agreement with the conclusion of the Special Master that the United States possesses the power to reserve water of the Gila and San Francisco Rivers for use in national forests, it is not necessary that this question be resolved here, since it is clear that the Master erred in his finding of an intent to reserve water for national forest purposes.

By the Act of March 3, 1891[98] Congress authorized the President to set apart and reserve as national forests any part of the public lands covered wholly or partially with timber or undergrowth. Section 18 of the Act provided:

> "That the right of way through the public lands and *reservations* of the United States is hereby granted to any canal or ditch company formed for the purpose of irrigation and duly organized under the laws of any State or Territory, which shall have filed, or may hereafter file, with the Secretary of the Interior a copy of its articles of incorporation, and due proofs of its organization under the same, to the extent of the ground occupied by the water of the reservoir and of the canal and its laterals, and fifty feet on each side of the marginal limits thereof; also the right to take, from the public lands adjacent to the line of the canal or ditch, material, earth, and stone necessary for the construction of

[98] 26 Stat. 1101.

such canal or ditch: *Provided,* That no such right of way shall be so located as to interfere with the proper occupation by the Government of any such reservation, and all maps of location shall be subject to the approval of the Department of the Government having jurisdiction of such reservation, *and the privilege herein granted shall not be construed to interfere with the control of water for irrigation and other purposes under authority of the respective States or Territories.*"

The Act of June 4, 1897[99] contains the following provisions regarding the use of waters within national forests:

> "All waters on such reservations may be used for domestic, mining, milling, or irrigation purposes, under the laws of the State wherein such forest reservations are situated, or under the laws of the United States and the rules and regulations established thereunder."

From 1936 to 1944, funds were appropriated by Congress for the purchase and establishment by the Forest Service of water rights for use on the national forests.[100] The Act of September 21, 1944[101] authorized appropriations for that purpose as follows:

> "There are hereby authorized to be appropriated for expenditure by the Forest Service such sums as may be necessary for the investigation and establishment of water rights, including the purchase thereof or of lands or interests in lands or rights-of-way for

[99] 30 Stat. 36.

[100] 49 Stat. 1438 (1936); 50 Stat. 412 (1937); 52 Stat. 727 (1938); 53 Stat. 956 (1939); 54 Stat. 547 (1940); 55 Stat. 423 (1941); 56 Stat. 680 (1942); 57 Stat. 412 (1943).

[101] 58 Stat. 737, 16 U. S. C. §526 (1958).

use and protection of water rights necessary or beneficial in connection with the administration and public use of the national forests."

In its discussion of the 1936 Appropriation Act, the House Committee stated:

> "*Water rights.*—The committee has included a new item, not in the Budget, to enable the Forest Service to investigate the needs for and acquire water rights for the national forests."[102]

And with reference to the 1939 Act the House Committee Report stated:

> "*Water rights.*—An appropriation of $10,000 was provided by the committee 2 years ago and continued last year in the same amount for perfecting water rights in the national forests. Under these appropriations a total of 257 filings and land-purchase actions will have been completed by the end of the current fiscal year, all within the Colorado River drainage basin. It is estimated that 619 additional actions in that basin will be required and that 1,000 actions in national-forest territory outside the Colorado River Basin will be required—all at a total estimated additional cost of $110,400. *In view of the importance of filing on water rights before possible adverse claimants, the committee has increased the appropriation in the accompanying bill to $20,000.*"[103]

This legislation, beginning with the Act of March 3, 1891 authorizing the establishment of national forests, evidences the intent of Congress not to interfere with the

---

[102] H. R. Rep. No. 2061, 74th Cong., 2d Sess. 9 (1936).

[103] H. R. Rep. No. 2130, 75th Cong., 3d Sess. 10 (1938).

control of water for irrigation and other purposes under authority of the states or territories. The Act of June 4, 1897 specifically authorizes the use of *all* water within national forests under the laws of the states in which the forests are situated. Certainly, the repeated appropriation of funds for the establishment and purchase of water rights by the Forest Service and the recognition by Congress of the importance of filing on water rights by the Forest Service before filing by adverse claimants is wholly incompatible with the notion that the United States intended to and did reserve such water at the time the national forests were created.

The department of the national government entrusted with the management and control of the national forests has "for nearly half a century" administratively construed these enactments as evidencing the intent of Congress that rights to the use of water for national forest purposes shall be obtained in accordance with state law.

The Forest Service Manual states:

> "*2514.1—Policy.* The rights to use water for national forest purposes will be obtained in accordance with State law. This policy is based on the act of June 4, 1897 (16 U. S. C. 481), which reads, in part, as follows:
>
> 'All waters within the boundaries of the national forests may be used for domestic, mining, milling, or irrigation purposes under the laws of the State wherein such national forests are situated, or under the laws of the United States and the rules and regulations established thereunder.'
>
> "*2514.2—Authority.* Departmental authority to secure water rights under State laws is confirmed

by the Department of Agriculture Organic Act of September 21, 1944 (58 Stat. 734).

The Assistant Secretary of Agriculture advised Congress in 1956 that:

> "For example, it has been the firmly established policy of this Department for nearly half a century to acquire, in strict accordance with State laws and procedures, the water rights needed for the administration of the national forests."[104]

None of this material was presented to the Special Master. Had it been brought to his attention, he could hardly have found that the United States, in withdrawing public land for the Gila National Forest, intended that water be automatically reserved for the forest.

The conclusion of the Special Master, that the United States is entitled to priorities as of the date of withdrawal of each area of the forest within which the water is used (Rep. 343) and that other uses from the Gila River System recognized by the Recommended Decree, to the extent that they are junior in time, are subordinate to the rights of the United States (Rep. 335), is not feasible of implementation. Priority dates were not fixed for other uses in Arizona or New Mexico, and in fact the basis of the rights recommended for New Mexico is satisfaction of present uses in disregard of senior rights in Arizona (Rep. 325-27).

APPENDIX A

Colorado River Compact

APPENDIX A

Colorado River Compact

The States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, having resolved to enter into a compact under the Act of the Congress of the United States of America approved August 19, 1921 (42 Statutes at Large, page 171), and the Acts of the Legislatures of the said States, have through their Governors appointed as their Commissioners:

W. S. Norviel for the State of Arizona
W. F. McClure for the State of California
Delph E. Carpenter for the State of Colorado
J. G. Scrugham for the State of Nevada
Stephen B. Davis, Jr., for the State of New Mexico
R. E. Caldwell for the State of Utah
Frank C. Emerson for the State of Wyoming

who, after negotiations participated in by Herbert Hoover appointed by The President as the representative of the United States of America, have agreed upon the following articles:

Article I

The major purposes of this compact are to provide for the equitable division and apportionment of the use of the waters of the Colorado River System; to establish the relative importance of different beneficial uses of water; to promote interstate comity; to remove causes of present and future controversies; and to secure the expeditious agricultural and industrial development of the Colorado River Basin, the storage of its waters, and the protection of life and property from floods. To these ends the Colorado River Basin is divided into two Basins, and an apportionment of the use of part of the water of the Colorado River System is made to each of them with the provision that further equitable apportionments may be made.

Appendix A

ARTICLE II

As used in this compact—

(a) The term "Colorado River System" means that portion of the Colorado River and its tributaries within the United States of America.

(b) The term "Colorado River Basin" means all of the drainage area of the Colorado River System and all other territory within the United States of America to which the waters of the Colorado River System shall be beneficially applied.

(c) The term "States of the Upper Division" means the States of Colorado, New Mexico, Utah, and Wyoming.

(d) The term "States of the Lower Division" means the States of Arizona, California, and Nevada.

(e) The term "Lee Ferry" means a point in the main stream of the Colorado River one mile below the mouth of the Paria River.

(f) The term "Upper Basin" means those parts of the States of Arizona, Colorado, New Mexico, Utah, and Wyoming within and from which waters naturally drain into the Colorado River System above Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the System above Lee Ferry.

(g) The term "Lower Basin" means those parts of the States of Arizona, California, Nevada, New Mexico, and Utah within and from which waters naturally drain into the Colorado River System below Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the System below Lee Ferry.

(h) The term "domestic use" shall include the use of water for household, stock, municipal, mining, milling, industrial, and other like purposes, but shall exclude the generation of electrical power.

ARTICLE III

(a) There is hereby apportioned from the Colorado River System in perpetuity to the Upper Basin and to the Lower Basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

(b) In addition to the apportionment in paragraph (a), the Lower Basin is hereby given the right to increase its beneficial consumptive use of such waters by one million acre-feet per annum.

(c) If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River System, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b); and if such surplus shall prove insufficient for this purpose, then, the burden of such deficiency shall be equally borne by the Upper Basin and the Lower Basin, and whenever necessary the States of the Upper Division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d).

(d) The States of the Upper Division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of ten consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification of this compact.

(e) The States of the Upper Division shall not withhold water, and the States of the Lower Division shall not require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses.

(f) Further equitable apportionment of the beneficial uses of the waters of the Colorado River System unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October first, 1963, if and when either Basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b).

(g) In the event of a desire for a further apportionment as provided in paragraph (f) any two signatory States, acting through their Governors, may give joint notice of such desire to the Governors of the other signatory States and to The President of the United States of America, and it shall be the duty of the Governors of the signatory States and of The President of the United States of America forthwith to appoint representatives, whose duty it shall be to divide and apportion equitably between the Upper Basin and Lower Basin the beneficial use of the unapportioned water of the Colorado River System as mentioned in paragraph (f), subject to the legislative ratification of the signatory States and the Congress of the United States of America.

ARTICLE IV

(a) Inasmuch as the Colorado River has ceased to be navigable for commerce and the reservation of its waters for navigation would seriously limit the development of its Basin, the use of its waters for purposes of navigation shall be subservient to the uses of such waters for domestic, agricultural, and power purposes. If the Congress shall not consent to this paragraph, the other provisions of this compact shall nevertheless remain binding.

(b) Subject to the provisions of this compact, water of the Colorado River System may be impounded and used for the generation of electrical power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

(c) The provisions of this article shall not apply to or interfere with the regulation and control by any State within its boundaries of the appropriation, use, and distribution of water.

ARTICLE V

The chief official of each signatory State charged with the administration of water rights, together with the Director of the United States Reclamation Service and the Director of the United States Geological Survey shall cooperate, ex-officio:

(a) To promote the systematic determination and coordination of the facts as to flow, appropriation, consumption, and use of water in the Colorado River Basin, and the interchange of available information in such matters.

(b) To secure the ascertainment and publication of the annual flow of the Colorado River at Lee Ferry.

(c) To perform such other duties as may be assigned by mutual consent of the signatories from time to time.

ARTICLE VI

Should any claim or controversy arise between any two or more of the signatory States: (a) with respect to the waters of the Colorado River System not covered by the terms of this compact; (b) over the meaning or performance of any of the terms of this compact; (c) as to the allocation of the burdens incident to the performance of any article of this compact or the delivery of waters as herein provided; (d) as to the construction or operation of works

within the Colorado River Basin to be situated in two or more States, or to be constructed in one State for the benefit of another State; or (e) as to the diversion of water in one State for the benefit of another State; the Governors of the States affected, upon the request of one of them, shall forthwith appoint Commissioners with power to consider and adjust such claim or controversy, subject to ratification by the Legislatures of the States so affected.

Nothing herein contained shall prevent the adjustment of any such claim or controversy by any present method or by direct future legislative action of the interested States.

ARTICLE VII

Nothing in this compact shall be construed as affecting the obligations of the United States of America to Indian tribes.

ARTICLE VIII

Present perfected rights to the beneficial use of waters of the Colorado River System are unimpaired by this compact. Whenever storage capacity of 5,000,000 acre-feet shall have been provided on the main Colorado River within or for the benefit of the Lower Basin, then claims of such rights, if any, by appropriators or users of water in the Lower Basin against appropriators or users of water in the Upper Basin shall attach to and be satisfied from water that may be stored not in conflict with Article III.

All other rights to beneficial use of waters of the Colorado River System shall be satisfied solely from the water apportioned to that Basin in which they are situate.

ARTICLE IX

Nothing in this compact shall be construed to limit or prevent any State from instituting or maintaining any action or proceeding, legal or equitable, for the protection of any right under this compact or the enforcement of any of its provisions.

Appendix A

ARTICLE X

This compact may be terminated at any time by the unanimous agreement of the signatory States. In the event of such termination all rights established under it shall continue unimpaired.

ARTICLE XI

This compact shall become binding and obligatory when it shall have been approved by the Legislatures of each of the signatory States and by the Congress of the United States. Notice of approval by the Legislatures shall be given by the Governor of each signatory State to the Governors of the other signatory States and to the President of the United States, and the President of the United States is requested to give notice to the Governors of the signatory States of approval by the Congress of the United States.

IN WITNESS WHEREOF, the Commissioners have signed this compact in a single original, which shall be deposited in the archives of the Department of State of the United States of America and of which a duly certified copy shall be forwarded to the Governor of each of the signatory States.

APPENDIX B

Boulder Canyon Project Act

APPENDIX B

Boulder Canyon Project Act

[45 STAT. 1057 (1928), 43 U. S. C. §§617-617t (1958)]

AN ACT To provide for the construction of works for the protection and development of the Colorado River Basin, for the approval of the Colorado River compact, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That for the purpose of controlling the floods, improving navigation and regulating the flow of the Colorado River, providing for storage and for the delivery of the stored waters thereof for reclamation of public lands and other beneficial uses exclusively within the United States, and for the generation of electrical energy as a means of making the project herein authorized a self-supporting and financially solvent undertaking, the Secretary of the Interior, subject to the terms of the Colorado River compact hereinafter mentioned, is hereby authorized to construct, operate, and maintain a dam and incidental works in the main stream of the Colorado River at Black Canyon or Boulder Canyon adequate to create a storage reservoir of a capacity of not less than twenty million acre-feet of water and a main canal and appurtenant structures located entirely within the United States connecting the Laguna Dam, or other suitable diversion dam, which the Secretary of the Interior is hereby authorized to construct if deemed necessary or advisable by him upon engineering or economic considerations, with the Imperial and Coachella Valleys in California, the expenditures for said main canal and appurtentant structures to be reimbursable, as provided in the reclamation law, and shall not be paid out of revenues derived from the sale or disposal of water power or electric energy at the dam authorized to be constructed at said Black Canyon or Boulder Canyon, or for water for potable purposes outside

of the Imperial and Coachella Valleys: *Provided, however,* That no charge shall be made for water or for the use, storage, or delivery of water for irrigation or water for potable purposes in the Imperial or Coachella Valleys; also to construct and equip, operate, and maintain at or near said dam, or cause to be constructed, a complete plant and incidental structures suitable for the fullest economic development of electrical energy from the water discharged from said reservoir; and to acquire by proceedings in eminent domain, or otherwise, all lands, rights-of-way, and other property necessary for said purposes.

SEC. 2. (a) There is hereby established a special fund, to be known as the "Colorado River Dam fund" (hereinafter referred to as the "fund"), and to be available, as hereafter provided, only for carrying out the provisions of this Act. All revenues received in carrying out the provisions of this Act shall be paid into and expenditures shall be made out of the fund, under the direction of the Secretary of the Interior.

(b) The Secretary of the Treasury is authorized to advance to the fund, from time to time and within the appropriations therefor, such amounts as the Secretary of the Interior deems necessary for carrying out the provisions of this Act, except that the aggegate amount of such advances shall not exceed the sum of $165,000,000. Of this amount the sum of $25,000,000 shall be allocated to flood control and shall be repaid to the United States out of 62½ per centum of revenues, if any, in excess of the amount necessary to meet periodical payments during the period of amortization, as provided in section 4 of this Act. If said sum of $25,000,000 is not repaid in full during the period of amortization, then 62½ per centum of all net revenues shall be applied to payment of the remainder. Interest at the rate of 4 per centum per annum accruing during the year upon the amounts so advanced and remaining unpaid shall

be paid annually out of the fund, except as herein otherwise provided.

(c) Moneys in the fund advanced under subdivision (b) shall be available only for expenditures for construction and the payment of interest, during construction, upon the amounts so advanced. No expenditures out of the fund shall be made for operation and maintenance except from appropriations therefor.

(d) The Secretary of the Treasury shall charge the fund as of June 30 in each year with such amount as may be necessary for the payment of interest on advances made under subdivision (b) at the rate of 4 per centum per annum accrued during the year upon the amounts so advanced and remaining unpaid, except that if the fund is insufficient to meet the payment of interest the Secretary of the Treasury may, in his discretion, defer any part of such payment, and the amount so deferred shall bear interest at the rate of 4 per centum per annum until paid.

(e) The Secretary of the Interior shall certify to the Secretary of the Treasury, at the close of each fiscal year, the amount of money in the fund in excess of the amount necessary for construction, operation, and maintenance, and payment of interest. Upon receipt of each such certificate the Secretary of the Treasury is authorized and directed to charge the fund with the amount so certified as repayment of the advances made under subdivision (b), which amount shall be covered into the Treasury to the credit of miscellaneous receipts.

SEC. 3. There is hereby authorized to be appropriated from time to time, out of any money in the Treasury not otherwise appropriated, such sums of money as may be necessary to carry out the purposes of this Act, not exceeding in the aggregate $165,000,000.

Appendix B

SEC. 4. (a) This Act shall not take effect and no authority shall be exercised hereunder and no work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, and no water rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or perfect any claims to the use of water pertinent to such works or structures unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact, *mentioned* in section 13 hereof, and the President by public proclamation shall have so declared, or (2) if said States fail to ratify the said compact within six months from the date of the passage of this Act then, until six of said States, including the State of California, shall ratify said compact and shall consent to waive the provisions of the first paragraph of Article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States signatory thereto, and shall have approved said compact without conditions, save that of such six-State approval, and the President by public proclamation shall have so declared, and, further, until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benfit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this Act, that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any excess or surplus

waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of Article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin, and (5) that the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses, and (6) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact, and (7) said agreement to take effect upon the ratification of the Colorado River compact by Arizona, California, and Nevada.

Appendix B

(b) Before any money is appropriated for the construction of said dam or power plant, or any construction work done or contracted for, the Secretary of the Interior shall make provision for revenues by contract, in accordance with the provisions of this Act, adequate in his judgment to insure payment of all expenses of operation and maintenance of said works incurred by the United States and the repayment, within fifty years from the date of the completion of said works, of all amounts advanced to the fund under subdivision (b) of section 2 for such works, together with interest thereon made reimbursable under this Act.

Before any money is appropriated for the construction of said main canal and appurtenant structures to connect the Laguna Dam with the Imperial and Coachella Valleys in California, or any construction work is done upon said canal or contracted for, the Secretary of the Interior shall make provision for revenues, by contract or otherwise, adequate in his judgment to insure payment of all expenses of construction, operation, and maintenance of said main canal and appurtenant structures in the manner provided in the reclamation law.

If during the period of amortization the Secretary of the Interior shall receive revenues in excess of the amount necessary to meet the periodical payments to the United States as provided in the contract, or contracts, executed under this Act, then, immediately after the settlement of such periodical payments, he shall pay to the State of Arizona 18¾ per centum of such excess revenues and to the State of Nevada 18¾ per centum of such excess revenues.

SEC. 5. That the Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses, and generation of electrical energy and

delivery at the switchboard to States, municipal corporations, political subdivisions, and private corporations of electrical energy generated at said dam, upon charges that will provide revenue which, in addition to other revenue accruing under the reclamation law and under this Act, will in his judgment cover all expenses of operation and maintenance incurred by the United States on account of works constructed under this Act and the payments to the United States under subdivision (b) of section 4. Contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to paragraph (a) of section 4 of this Act. No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated.

After the repayments to the United States of all money advanced with interest, charges shall be on such basis and the revenues derived therefrom shall be kept in a separate fund to be expended within the Colorado River Basin as may hereafter be prescribed by the Congress.

General and uniform regulations shall be prescribed by the said Secretary for the awarding of contracts for the sale and delivery of electrical energy, and for renewals under subdivision (b) of this section, and in making such contracts the following shall govern:

(a) No contract for electrical energy or for generation of electrical energy shall be of longer duration than fifty years from the date at which such energy is ready for delivery.

Contracts made pursuant to subdivision (a) of this section shall be made with a view to obtaining reasonable returns and shall contain provisions whereby at the end of fifteen years from the date of their execution and every ten years thereafter, there shall be readjustment of the contract, upon the demand of either party thereto, either upward or downward as to price, as the Secretary of the Interior may find to be justified by competitive conditions

at distributing points or competitive centers, and with provisions under which disputes or disagreements as to interpretation or performance of such contract shall be determined either by arbitration or court proceedings, the Secretary of the Interior being authorized to act for the United States in such readjustments or proceedings.

(b) The holder of any contract for electrical energy not in default thereunder shall be entitled to a renewal thereof upon such terms and conditions as may be authorized or required under the then existing laws and regulations, unless the property of such holder dependent for its usefulness on a continuation of the contract be purchased or acquired and such holder be compensated for damages to its property, used and useful in the transmission and distribution of such electrical energy and not taken, resulting from the termination of the supply.

(c) Contracts for the use of water and necessary privileges for the generation and distribution of hydroelectric energy or for the sale and delivery of electrical energy shall be made with responsible applicants therefor who will pay the price fixed by the said Secretary with a view to meeting the revenue requirements herein provided for. In case of conflicting applications, if any, such conflicts shall be resolved by the said Secretary, after hearing, with due regard to the public interest, and in conformity with the policy expressed in the Federal Water Power Act as to conflicting applications for permits and licenses, except that preference to applicants for the use of water and appurtenant works and privileges necessary for the generation and distribution of hydroelectric energy, or for delivery at the switchboard of a hydroelectric plant, shall be given, first, to a State for the generation or purchase of electric energy for use in the State, and the States of Arizona, California, and Nevada shall be given equal opportunity as such applicants.

Appendix B

The rights covered by such preference shall be contracted for by such State within six months after notice by the Secretary of the Interior and to be paid for on the same terms and conditions as may be provided in other similar contracts made by said Secretary: *Provided, however,* That no application of a State or a political subdivision for an allocation of water for power purposes or of electrical energy shall be denied or another application in conflict therewith be granted on the ground that the bond issue of such State or political subdivision, necessary to enable the applicant to utilize such water and appurtenant works and privileges necessary for the generation and distribution of hydroelectric energy, or the electrical energy applied for, has not been authorized or marketed, until after a reasonable time, to be determined by the said Secretary, has been given to such applicant to have such bond issue authorized and marketed.

(d) Any agency receiving a contract for electrical energy equivalent to one hundred thousand firm horsepower or more, may, when deemed feasible by the said Secretary, from engineering and economic considerations and under general regulations prescribed by him, be required to permit any other agency having contracts hereunder for less than the equivalent of twenty-five thousand firm horsepower, upon application to the Secretary of the Interior made within sixty days from the execution of the contract of the agency the use of whose transmission line is applied for, to participate in the benefits and use of any main transmission line constructed or to be constructed by the former for carrying such energy (not exceeding, however, one-fourth the capacity of such line), upon payment by such other agencies of a reasonable share of the cost of construction, operation, and maintenance thereof.

The use is hereby authorized of such public and reserved lands of the United States as may be necessary or convenient for the construction, operation, and maintenance of main transmission lines to transmit said electrical energy.

Appendix B

SEC. 6. That the dam and reservoir provided for by section 1 hereof shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of present perfected rights in pursuance of Article VIII of said Colorado River compact; and third, for power. The title to said dam, reservoir, plant, and incidental works shall forever remain in the United States, and the United States shall, until otherwise provided by Congress, control, manage, and operate the same, except as herein otherwise provided: *Provided, however,* That the Secretary of the Interior may, in his discretion, enter into contracts of lease of a unit or units of any Government-built plant, with right to generate electrical energy, or, alternatively, to enter into contracts of lease for the use of water for the generation of electrical energy as herein provided, in either of which events the provisions of section 5 of this Act relating to revenue, term, renewals, determination of conflicting applications, and joint use of transmission lines under contracts for the sale of electrical energy, shall apply.

The Secretary of the Interior shall prescribe and enforce rules and regulations conforming with the requirements of the Federal Water Power Act, so far as applicable, respecting maintenance of works in condition of repair adequate for their efficient operation, maintenance of a system of accounting, control of rates and service in the absence of State regulation or interstate agreement, valuation for rate-making purposes, transfers of contracts, contracts extending beyond the lease period, expropriation of excessive profits, recapture and/or emergency use by the United States of property of lessees, and penalties for enforcing regulations made under this Act of penalizing failure to comply with such regulations or with the provisions of this Act. He shall also conform with other provisions of the Federal Water Power Act and of the rules and regulations of the Federal Power Commission, which have been devised

or which may be hereafter devised, for the protection of the investor and consumer.

The Federal Power Commission is hereby directed not to issue or approve any permits or licenses under said Federal Water Power Act upon or affecting the Colorado River or any of its tributaries, except the Gila River, in the States of Colorado, Wyoming, Utah, New Mexico, Nevada, Arizona, and California until this Act shall become effective as provided in section 4 herein.

SEC. 7. That the Secretary of the Interior may, in his discretion, when repayments to the United States of all money advanced, with interest, reimbursable hereunder, shall have been made, transfer the title to said canal and appurtenant structures, except the Laguna Dam and the main canal and appurtenant structures down to and including Syphon Drop, to the districts or other agencies of the United States having a beneficial interest therein in proportion to their respective capital investments under such form of organization as may by acceptable to him. The said districts or other agencies shall have the privilege at any time of utilizing by contract or otherwise such power possibilities as may exist upon said canal, in proportion to their respective contributions or obligations toward the capital cost of said canal and appurtenant structures from and including the diversion works to the point where each respective power plant may be located. The net proceeds from any power development on said canal shall be paid into the fund and credited to said districts or other agencies on their said contracts, in proportion to their rights to develop power, until the districts or other agencies using said canal shall have paid thereby and under any contract or otherwise an amount of money equivalent to the operation and maintenance expense and cost of construction thereof.

SEC. 8. (a) The United States, its permittees, licensees, and contractees, and all users and appropriators of water

stored, diverted, carried, and/or distributed by the reservoir, canals, and other works herein authorized, shall observe and be subject to and controlled by said Colorado River compact in the construction, management, and operation of said reservoir, canals, and other works and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other purposes, anything in this Act to the contrary notwithstanding, and all permits, licenses, and contracts shall so provide.

(b) Also the United States, in constructing, managing, and operating the dam, reservoir, canals, and other works herein authorized, including the appropriation, delivery, and use of water for the generation of power, irrigation, or other uses, and all users of water thus delivered and all users and appropriators of waters stored by said reservoir and/or carried by said canal, including all permittees and licensees of the United States or any of its agencies, shall observe and be subject to and controlled, anything to the contrary herein notwithstanding, by the terms of such compact, if any, between the States of Arizona, California, and Nevada, or any two thereof, for the equitable division of the benefits, including power, arising from the use of water accruing to said States, subsidiary to and consistent with said Colorado River compact, which may be negotiated and approved by said States and to which Congress shall give its consent and approval on or before January 1, 1929; and the terms of any such compact concluded between said States and approved and consented to by Congress after said date: *Provided*, That in the latter case such compact shall be subject to all contracts, if any, made by the Secretary of the Interior under section 5 hereof prior to the date of such approval and consent by Congress.

SEC. 9. All lands of the United States found by the Secretary of the Interior to be practicable of irrigation and reclamation by the irrigation works authorized herein shall

be withdrawn from public entry. Thereafter, at the direction of the Secretary of the Interior, such lands shall be opened for entry, in tracts varying in size but not exceeding one hundred and sixty acres, as may be determined by the Secretary of the Interior, in accordance with the provisions of the reclamation law, and any such entryman shall pay an equitable share in accordance with the benefits received, as determined by the said Secretary, of the construction cost of said canal and appurtenant structures; said payments to be made in such installments and at such times as may be specified by the Secretary of the Interior, in accordance with the provisions of the said reclamation law, and shall constitute revenue from said project and be covered into the fund herein provided for: *Provided,* That all persons who served in the United States Army, Navy, Marine Corps, or Coast Guard during World War II, the War with Germany, the War with Spain, or in the suppression of the insurrection in the Philippines, and who have been honorably separated or discharged therefrom or placed in the Regular Army or Naval Reserve, shall have the exclusive preference right for a period of three months to enter said lands, subject, however, to the provisions of subsection (c) of section 4 of the Act of December 5, 1924 (43 Stat. 672, 702; 43 U. S. C., sec. 433); and also, so far as practicable, preference shall be given to said persons in all construction work authorized by this chapter: *Provided further,* That the above exclusive preference rights shall apply to veteran settlers on lands watered from the Gila canal in Arizona the same as to veteran settlers on lands watered from the All-American canal in California: *Provided further,* That in the event such an entry shall be relinquished at any time prior to actual residence upon the land by the entryman for not less than one year, lands so relinquished shall not be subject to entry for a period of sixty days after the filing and notation of the relinquishment in the local land office, and after the expiration of said

sixty-day period such lands shall be open to entry, subject to the preference in this section provided.[1]

SEC. 10. That nothing in this Act shall be construed as modifying in any manner the existing contract, dated October 23, 1918, between the United States and the Imperial Irrigation District, providing for a connection with Laguna Dam; but the Secretary of the Interior is authorized to enter into contract or contracts with the said district or other districts, persons, or agencies for the construction, in accordance with this Act, of said canal and appurtenant structures, and also for the operation and maintenance thereof, with the consent of the other users.

SEC. 11. That the Secretary of the Interior is hereby authorized to make such studies, surveys, investigations, and do such engineering as may be necessary to determine the lands in the State of Arizona that should be embraced within the boundaries of a reclamation project, heretofore commonly known and hereafter to be known as the Parker-Gila Valley reclamation project, and to recommend the most practicable and feasible method of irrigating lands within said project, or units thereof, and the cost of the same; and the appropriation of such sums of money as may be necessary for the aforesaid purposes from time to time is hereby authorized. The Secretary shall report to Congress as soon as practicable, and not later than December 10, 1931, his findings, conclusions, and recommendations regarding such project.

SEC. 12. "Political subdivision" or "political subdivisions" as used in this Act shall be understood to include any State, irrigation or other district, municipality, or other governmental organization.

"Reclamation law" as used in this Act shall be understood to mean that certain Act of the Congress of the

---

[1] As amended by the Act of March 6, 1946 (60 Stat. 36).

United States approved June 17, 1902, entitled "An Act appropriating the receipts from the sale and disposal of public land in certain States and Territories to the construction of irrigation works for the reclamation of arid lands," and the Acts amendatory thereof and supplemental thereto.

"Maintenance" as used herein shall be deemed to include in each instance provision for keeping the works in good operating condition.

"The Federal Water Power Act," as used in this Act, shall be understood to mean that certain Act of Congress of the United States approved June 10, 1920, entitled "An Act to create a Federal Power Commission; to provide for the improvement of navigation; the development of water power; the use of the public lands in relation thereto; and to repeal section 18 of the River and Harbor Appropriation Act, approved August 8, 1917, and for other purposes," and the Acts amendatory thereof and supplemental thereto.

"Domestic" whenever employed in this Act shall include water uses defined as "domestic" in said Colorado River compact.

SEC. 13. (a) The Colorado River compact signed at Santa Fe, New Mexico, November 24, 1922, pursuant to Act of Congress approved August 19, 1921, entitled "An Act to permit a compact or agreement between the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming respecting the disposition and apportionment of the waters of the Colorado River, and for other purposes," is hereby approved by the Congress of the United States, and the provisions of the first paragraph of article 11 of the said Colorado River compact, making said compact binding and obligatory when it shall have been approved by the legislature of each of the signatory States, are hereby waived, and this approval shall become effective when the State of California and at least five of the other States mentioned, shall have approved or may hereafter

approve said compact as aforesaid and shall consent to such waiver, as herein provided.

(b) The rights of the United States in or to waters of the Colorado River and its tributaries howsoever claimed or acquired, as well as the rights of those claiming under the United States, shall be subject to and controlled by said Colorado River compact.

(c) Also all patents, grants, contracts, concessions, leases, permits, licenses, rights-of-way, or other privileges from the United States or under its authority, necessary or convenient for the use of waters of the Colorado River or its tributaries, or for the generation or transmission of electrical energy generated by means of the waters of said river or its tributaries, whether under this Act, the Federal Water Power Act, or otherwise, shall be upon the express condition and with the express covenant that the rights of the recipients or holders thereof to waters of the river or its tributaries, for the use of which the same are necessary, convenient, or incidental, and the use of the same shall likewise be subject to and controlled by said Colorado River compact.

(d) The conditions and covenants referred to herein shall be deemed to run with the land and the right, interest, or privilege therein and water right, and shall attach as a matter of law, whether set out or referred to in the instrument evidencing any such patent, grant, contract, concession, lease, permit, license, right-of-way, or other privilege from the United States or under its authority, or not, and shall be deemed to be for the benefit of and be available to the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, and the users of water therein or thereunder, by way of suit, defense, or otherwise, in any litigation respecting the waters of the Colorado River or its tributaries.

Appendix B

SEC. 14. This Act shall be deemed a supplement to the reclamation law, which said reclamation law shall govern the construction, operation, and management of the works herein authorized, except as otherwise herein provided.

SEC. 15. The Secretary of the Interior is authorized and directed to make investigation and public reports of the feasibility of projects for irrigation, generation of electric power, and other purposes in the States of Arizona, Nevada, Colorado, New Mexico, Utah, and Wyoming for the purpose of making such information available to said States and to the Congress, and of formulating a comprehensive scheme of control and the improvement and utilization of the water of the Colorado River and its tributaries. The sum of $250,000 is hereby authorized to be appropriated from said Colorado River Dam fund, created by section 2 of this Act, for such purposes.

SEC. 16. In furtherance of any comprehensive plan formulated hereafter for the control, improvement, and utilization of the resources of the Colorado River system and to the end that the project authorized by this Act may constitute and be administered as a unit in such control, improvement, and utilization, any commission or commissioner duly authorized under the laws of any ratifying State in that behalf shall have the right to act in an advisory capacity to and in cooperation with the Secretary of the Interior in the exercise of any authority under the provisions of sections 4, 5, and 14 of this Act, and shall have at all times access to records of all Federal agencies empowered to act under said sections, and shall be entitled to have copies of said records on request.

SEC. 17. Claims of the United States arising out of any contract authorized by this Act shall have priority over all others, secured or unsecured.

SEC. 18. Nothing herein shall be construed as interfering with such rights as the States now have either to the

waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters within their borders, except as modified by the Colorado River compact or other interstate agreement.

SEC. 19. That the consent of Congress is hereby given to the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming to negotiate and enter into compacts or agreements, supplemental to and in conformity with the Colorado River compact and consistent with this Act for a comprehensive plan for the development of the Colorado River and providing for the storage, diversion, and use of the waters of said river. Any such compact or agreement may provide for the construction of dams, headworks, and other diversion works or structures for flood control, reclamation, improvement of navigation, division of water, or other purposes and/or the construction of power houses or other structures for the purpose of the development of water power and the financing of the same; and for such purposes may authorize the creation of interstate commissions and/or the creation of corporations, authorities, or other instrumentalities.

(a) Such consent is given upon condition that a representative of the United States, to be appointed by the President, shall participate in the negotiations and shall make report to Congress of the proceedings and of any compact or agreement entered into.

(b) No such compact or agreement shall be binding or obligatory upon any of such States unless and until it has been approved by the legislature of each of such States and by the Congress of the United States.

SEC. 20. Nothing in this Act shall be construed as a denial or recognition of any rights, if any, in Mexico to the use of the waters of the Colorado River system.

SEC. 21. That the short title of this Act shall be "Boulder Canyon Project Act."

APPENDIX C

California Limitation Act

APPENDIX C

California Limitation Act

(Act of March 4, 1929; Ch. 16, 48th Sess.; Statutes and Amendments to the Codes, 1929, pp. 38-39)

CHAPTER 16

An act to limit the use by California of the waters of the Colorado river in compliance with the act of congress known as the "Boulder canyon project act," approved December 21, 1928, in the event the Colorado river compact is not approved by all of the states signatory thereto

(Approved by the Governor March 4, 1929; in effect August 14, 1929)

The people of the State of California do enact as follows:

SECTION 1. In the event the Colorado river compact signed at Santa Fe, New Mexico, November 24, 1922, and approved by and set out at length in that certain act entitled "An act to ratify and approve the Colorado river compact, signed at Santa Fe, New Mexico, November 24, 1922, to repeal conflicting acts and resolutions and directing that notice be given by the governor of such ratifications and approval," approved January 10, 1929 (statutes 1929, chapter 1), is not approved within six months from the date of the passage of that certain act of the congress of the United States known as the "Boulder canyon project act," approved December 21, 1928, by the legislatures of each of the seven states signatory thereto, as provided by article eleven of the said Colorado river compact, then when six of said states, including California, shall have ratified and approved said compact, and shall have consented to waive the provisions of the first paragraph of article eleven of said compact which makes the same binding and obligatory when

approved by each of the states signatory thereto, and shall have approved said compact without conditions save that of such six states' approval and the President by public proclamation shall have so declared, as provided by the said "Boulder canyon project act," the State of California as of the date of such proclamation agrees irrevocably and unconditionally with the United States and for the benefit of the states of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming as an express covenant and in consideration of the passage of the said "Boulder canyon project act" that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado river for use in the State of California including all uses under contracts made under the provisions of said "Boulder canyon project act," and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin states by paragraph "a" of article three of the said Colorado river compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

SEC. 2. By this act the State of California intends to comply with the conditions respecting limitation on the use of water as specified in subdivision 2 of section 4 (a) of the said "Boulder canyon project act" and this act shall be so construed.

APPENDIX D

General Regulations Governing Contracts for the Storage of Water in Boulder Canyon Reservoir, and the Delivery Thereof

APPENDIX D

General Regulations Governing Contracts for the Storage of Water in Boulder Canyon Reservoir, and the Delivery Thereof

1. No person shall have or be entitled to have the use for any purpose of the water stored in Boulder Canyon Reservoir except by contract made in pursuance of these regulations. All contracts for delivery of water shall be subject to all the terms and provisions of the Colorado River Compact and of the Boulder Canyon Project Act.

2. The right is reserved to amend or extend these regulations from time to time consistently with said compact and the laws of Congress, as the public need may require.

3. Storage water in Boulder Canyon Reservoir will be delivered upon such terms and conditions as the Secretary may fix from time to time by regulations and contracts thereunder. Water so contracted for may be delivered at such points on the river as may be agreed upon for irrigation and domestic uses.

4. Contracts respecting water for irrigation and domestic uses shall be for permanent service, and shall conform to Paragraph a of Section 4 of the Boulder Canyon Project Act.

5. No charge shall be made for water or for the use, storage or delivery of water for irrigation or for water for potable purposes in the Imperial and Coachella Valleys. Charges otherwise shall be fixed by regulation from time to time. Where water is permitted by the Secretary to be taken from the Colorado River from the reservoir above the Hoover Dam, the utilization of the power plant will be impaired to that extent, and the right is reserved to make

a higher charge for water taken above the dam, than if delivery is made below the dam.

6. Subject to the provisions of Article 7 of these regulations, deliveries of water to users in California shall be in accordance with the following recommendation of the State Division of Water Resources:

The waters of the Colorado River available for use within the State of California under the Colorado River Compact and the Boulder Canyon Project Act shall be apportioned to the respective interests below named and in amounts and with priorities therein named and set forth, as follows:

SECTION 1. A first priority to Palo Verde Irrigation District for beneficial use exclusively upon lands in said District as it now exists and upon lands between said District and the Colorado River, aggregating (within and without said District) a gross area of 104,500 acres, such waters as may be required by said lands.

SECTION 2. A second priority to Yuma Project of United States Bureau of Reclamation for beneficial use upon not exceeding a gross area of 25,000 acres of land located in said project in California, such waters as may be required by said lands.

SECTION 3. A third priority (a) to Imperial Irrigation District and other lands under or that will be served from the All-American Canal in Imperial and Coachella Valleys, and (b) to Palo Verde Irrigation District for use exclusively on 16,000 acres in that area known as the "Lower Palo Verde Mesa," adjacent to Palo Verde Irrigation District, for beneficial consumptive use, 3,850,000 acre feet of water per annum less the beneficial consumptive use under the priorities

designated in Sections 1 and 2 above. The rights designated (a) and (b) in this section are equal in priority. The total beneficial consumptive use under priorities stated in Sections 1, 2 and 3 of this article shall not exceed 3,850,000 acre feet of water per annum.

SECTION 4. A fourth priority to the Metropolitan Water District of Southern California and/or the City of Los Angeles, for beneficial consumptive use, by themselves and/or others, on the Coastal Plain of Southern California, 550,000 acre feet of water per annum.

SECTION 5. A fifth priority (a) to The Metropolitan Water District of Southern California and/or the City of Los Angeles, for beneficial consumptive use, by themselves and/or others, on the Coastal Plain of Southern California, 550,000 acre feet of water per annum and (b) to the City of San Diego and/or County of San Diego, for beneficial consumptive use, 112,000 acre feet of water per annum. The rights designated (a) and (b) in this section are equal in priority.

SECTION 6. A sixth priority (a) to Imperial Irrigation District and other lands under or that will be served from the All-American Canal in Imperial and Coachella Valleys, and (b) to Palo Verde Irrigation District for use exclusively on 16,000 acres in that area known as the "Lower Palo Verde Mesa," adjacent to Palo Verde Irrigation District, for beneficial consumptive use, 300,000 acre feet of water per annum. The rights designated (a) and (b) in this section are equal in priority.

SECTION 7. A seventh priority of all remaining water available for use within California, for agricultural use in the Colorado River Basin in California, as said basin is designated on Map No. 23000 of the Department of the Interior, Bureau of Reclamation.

Appendix D

SECTION 8. So far as the rights of the allottees named above are concerned, the Metropolitan Water District of Southern California and/or the City of Los Angeles shall have the exclusive right to withdraw and divert into its aqueduct any water in Boulder Canyon Reservoir accumulated to the individual credit of said District and/or said City (not exceeding at any one time 4,750,000 acre feet in the aggregate) by reason of reduced diversions by said District and/or said City; provided, that accumulations shall be subject to such conditions as to accumulation, retention, release and withdrawal as the Secretary of the Interior may from time to time prescribe in his discretion, and his determination thereof shall be final; provided further, that the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between said District and/or said City and such users resulting therefrom.

SECTION 9. In addition, so far as the rights of the allottees named above are concerned, the City of San Diego and/or County of San Diego shall have the exclusive right to withdraw and divert into an aqueduct any water in Boulder Canyon Reservoir accumulated to the individual credit of said City and/or said County (not exceeding at any one time 250,000 acre feet in the aggregate) by reason of reduced diversions by said City and/or said County; provided, that accumulations shall be subject to such conditions as to accumulation, retention, release and withdrawal as the Secretary of the Interior may from time to time prescribe in his discretion, and his determination thereof shall be final; provided further, that the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations

between the said City and/or said County and such users resulting therefrom.

SECTION 10. In no event shall the amounts allotted in this agreement to the Metropolitan Water District of Southern California and/or the City of Los Angeles be increased on account of inclusions of a supply for both said District and said City, and either or both may use said apportionments as may be agreed by and between said District and said City.

SECTION 11. In no event shall the amounts allotted in this agreement to the City of San Diego and/or to the County of San Diego be increased on account of inclusion of a supply for both said City and said County, and either or both may use said apportionments as may be agreed by and between said City and said County.

SECTION 12. The priorities hereinbefore set forth shall be in no wise affected by the relative dates of water contracts executed by the Secretary of the Interior with the various parties.

7. The Secretary reserves the right to contract with any of the allottees above named in accordance with the above stated recommendation, or, in the event that such recommendation as to Palo Verde Irrigation District is superseded by an agreement between all the above allottees or by a final judicial determination, to contract with the Palo Verde Irrigation District in accordance with such agreement or determination; *Provided,* that priorities numbered fourth and fifth in said recommendation shall not thereby be disturbed.

(Signed) RAY LYMAN WILBUR,
Secretary of the Interior.

Issued April 23, 1930;
Amended September 28, 1931

APPENDIX E

Arizona Contract of February 9, 1944

APPENDIX E

Arizona Contract of February 9, 1944

UNITED STATES DEPARTMENT OF THE INTERIOR

BUREAU OF RECLAMATION

BOULDER CANYON PROJECT

ARIZONA-CALIFORNIA-NEVADA

CONTRACT FOR DELIVERY OF WATER

THIS CONTRACT made this 9th day of February 1944 pursuant to the Act of Congress approved June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplemental thereto, all of which acts are commonly known and referred to as the Reclamation Law, and particularly pursuant to the Act of Congress approved December 21, 1928 (45 Stat. 1057), designated the Boulder Canyon Project Act, and acts amendatory thereof or supplementary thereto, between THE UNITED STATES OF AMERICA, hereinafter referred to as "United States," acting for this purpose by Harold L. Ickes, Secretary of the Interior, hereinafter referred to as the "Secretary," and the STATE OF ARIZONA, hereinafter referred to as "Arizona," acting for this purpose by the Colorado River Commission of Arizona, pursuant to Chapter 46 of the 1939 Session Laws of Arizona,

Witnesseth that:

EXPLANATORY RECITALS

2. Whereas for the purpose of controlling floods, improving navigation, regulating the flow of the Colorado River, providing for storage and for the delivery of stored waters for the reclamation of public lands and other beneficial uses exclusively within the United States, the Secretary acting under and in pursuance of the provisions of the Colorado River Compact and Boulder Canyon Project Act, and acts amendatory thereof or supplementary thereto, has

constructed and is now operating and maintaining in the main stream of the Colorado River at Black Canyon that certain structure known as and designated Boulder Dam and incidental works, creating thereby a reservoir designated Lake Mead of a capacity of about thirty-two million (32,000,000) acre-feet; and

3. Whereas said Boulder Canyon Project Act provides that the Secretary, under such general rules and regulations as he may prescribe, may contract for the storage of water in the reservoir created by Boulder Dam, and for the delivery of such water at such points on the river as may be agreed upon, for irrigation and domestic uses, and provides further that no person shall have or be entitled to have the use for any purpose of the water stored, as aforesaid, except by contract made as stated in said Act; and

4. Whereas it is the desire of the parties to this contract to contract for the storage of water and the delivery thereof for irrigation of lands and domestic uses within Arizona; and

5. Whereas nothing in this contract shall be construed as affecting the obligations of the United States to Indian tribes:

6. Now, therefore, in consideration of the mutual covenants herein contained, the parties hereto agree as follows, to wit:

DELIVERY OF WATER

7. (a) Subject to the availability thereof for use in Arizona under the provisions of the Colorado River Compact and the Boulder Canyon Project Act, the United States shall deliver and Arizona, or agencies or water users therein, will accept under this contract each calendar year from

storage in Lake Mead, at a point or points of diversion on the Colorado River approved by the Secretary, so much water as may be necessary for the beneficial consumptive use for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet.

(b) The United States also shall deliver from storage in Lake Mead for use in Arizona, at a point or points of diversion on the Colorado River approved by the Secretary, for the uses set forth in subdivision (a) of this Article, one-half of any excess or surplus waters unapportioned by the Colorado River Compact to the extent such water is available for use in Arizona under said compact and said act, less such excess or surplus water unapportioned by said compact as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said states as stated in subdivisions (f) and (g) of this Article.

(c) This contract is subject to the condition that Boulder Dam and Lake Mead shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of perfected rights in pursuance of Article VIII of the Colorado River Compact; and third, for power. This contract is made upon the express condition and with the express covenant that the United States and Arizona, and agencies and water users therein, shall observe and be subject to and controlled by said Colorado River Compact and the Boulder Canyon Project Act in the construction, management, and operation of Boulder Dam, Lake Mead, canals and other works, and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other uses.

(d) The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead, and such obligation shall

be subject to such reduction on account of evaporation, reservoir and river losses, as may be required to render this contract in conformity with said compact and said act.

(e) This contract is for permanent service, subject to the conditions stated in subdivision (c) of this Article, but as to the one-half of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) of Article III of the Colorado River Compact, such water is subject to further equitable apportionment at any time after October 1, 1963, as provided in Article III (f) and Article III (g) of the Colorado River Compact.

(f) Arizona recognizes the right of the United States and the State of Nevada to contract for the delivery from storage in Lake Mead for annual beneficial consumptive use within Nevada for agricultural and domestic uses of 300,000 acre-feet of the water apportioned to the Lower Basin by the Colorado River Compact, and in addition thereto to make contract for like use of 1/25 (one twenty-fifth) of any excess or surplus waters available in the Lower Basin and unapportioned by the Colorado River Compact, which waters are subject to further equitable apportionment after October 1, 1963, as provided in Article III (f) and Article III (g) of the Colorado River Compact.

(g) Arizona recognizes the rights of New Mexico and Utah to equitable shares of the water apportioned by the Colorado River Compact to the Lower Basin and also water unapportioned by such compact, and nothing contained in this contract shall prejudice such rights.

(h) Arizona recognizes the right of the United States and agencies of the State of California to contract for storage and delivery of water from Lake Mead for beneficial consumptive use in California, provided that the aggregate of all such deliveries and uses in California from the Colorado River shall not exceed the limitation of such uses in that State required by the provisions of the Boulder Can-

yon Project Act and agreed to by the State of California by an act of its Legislature (Chapter 16, Statutes of California of 1929) upon which limitation the State of Arizona expressly relies.

(i) Nothing in this contract shall preclude the parties hereto from contracting for storage and delivery above Lake Mead of water herein contracted for, when and if authorized by law.

(j) As far as reasonable diligence will permit, the water provided for in this contract shall be delivered as ordered and as reasonably required for domestic and irrigation uses within Arizona. The United States reserves the right to discontinue or temporarily reduce the amount of water to be delivered, for the purpose of investigation and inspection, maintenance, repairs, replacements, or installation of equipment or machinery at Boulder Dam, or other dams heretofore or hereafter to be constructed, but so far as feasible will give reasonable notice in advance of such temporary discontinuance or reduction.

(k) The United States, its officers, agents, and employees shall not be liable for damages when for any reason whatsoever suspensions or reductions in the delivery of water occur.

(*l*) Deliveries of water hereunder shall be made for use within Arizona to such individuals, irrigation districts, corporations or political subdivisions therein of Arizona as may contract therefor with the Secretary, and as may qualify under the Reclamation Law or other federal statutes or to lands of the United States within Arizona. All consumptive uses of water by users in Arizona, of water diverted from Lake Mead or from the main stream of the Colorado River below Boulder Dam, whether made under this contract or not, shall be deemed, when made, a discharge pro tanto of the obligation of this contract. Present

perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this contract.

(m) Rights-of-way across public lands necessary or convenient for canals to facilitate the full utilization in Arizona of the water herein agreed to be delivered will be granted by the Secretary subject to applicable federal statutes.

POINTS OF DIVERSION: MEASUREMENTS OF WATER

8. The water to be delivered under this contract shall be measured at the points of diversion, or elsewhere as the Secretary may designate (with suitable adjustment for losses between said points of diversion and measurement), by measuring and controlling devices or automatic gauges approved by the Secretary, which devices, however, shall be furnished, installed, and maintained by Arizona, or the users of water therein, in manner satisfactory to the Secretary; said measuring and controlling devices or automatic gauges shall be subject to the inspection of the United States, whose authorized representatives may at all times have access to them, and any deficiencies found shall be promptly corrected by the users thereof. The United States shall be under obligation to deliver water only at diversion points where measuring and controlling devices or automatic gauges are maintained, in accordance with this contract, but in the event diversions are made at points where such devices are not maintained, the Secretary shall estimate the quantity of such diversions and his determination thereof shall be final.

CHARGES FOR STORAGE AND DELIVERY OF WATER

9. No charge shall be made for the storage or delivery of water at diversion points as herein provided necessary to supply present perfected rights in Arizona. A charge of 50¢ per acre-foot shall be made for all water actually diverted directly from Lake Mead during the Boulder Dam

cost repayment period, which said charge shall be paid by the users of such water, subject to reduction by the Secretary in the amount of the charge if it is concluded by him at any time during said cost-repayment period that such charge is too high. After expiration of the cost-repayment period, charges shall be on such basis as may hereafter be prescribed by Congress. Charges for the storage or delivery of water diverted at a point or points below Boulder Dam, for users, other than those specified above, shall be as agreed upon between the Secretary and such users at the time of execution of contracts therefor, and shall be paid by such users; provided such charges shall, in no event, exceed 25¢ per acre-foot.

RESERVATIONS

10. Neither Article 7, nor any other provision of this contract, shall impair the right of Arizona and other states and the users of water therein to maintain, prosecute or defend any action respecting, and is without prejudice to, any of the respective contentions of said states and water users as to (1) the intent, effect, meaning, and interpretation of said compact and said act; (2) what part, if any, of the water used or contracted for by any of them falls within Article III (a) of the Colorado River Compact; (3) what part, if any, is within Article III (b) thereof; (4) what part, if any, is excess or surplus waters unapportioned by said Compact; and (5) what limitations on use, rights of use, and relative priorities exist as to the waters of the Colorado River system; provided, however, that by these reservations there is no intent to disturb the apportionment made by Article III (a) of the Colorado River Compact between the Upper Basin and the Lower Basin.

DISPUTES AND DISAGREEMENTS

11. Whenever a controversy arises out of this contract, and if the parties hereto then agree to submit the matter to

arbitration, Arizona shall name one arbitrator and the Secretary shall name one arbitrator and the two arbitrators thus chosen shall meet within ten days after their selection and shall elect one other arbitrator within fifteen days after their first meeting, but in the event of their failure to name the third arbitrator within thirty days after their first meeting, such arbitrator not so selected shall be named by the Senior Judge of the United States Circuit Court of Appeals for the Tenth Circuit. The decision of any two of the three arbitrators thus chosen shall be a valid and binding award.

RULES AND REGULATIONS

12. The Secretary may prescribe and enforce rules and regulations governing the delivery and diversion of waters hereunder, but such rules and regulations shall be promulgated, modified, revised or extended from time to time only after notice to the State of Arizona and opportunity is given to it to be heard. Arizona agrees for itself, its agencies and water users that in the operation and maintenance of the works for diversion and use of the water to be delivered hereunder, all such rules and regulations will be fully adhered to.

AGREEMENT SUBJECT TO COLORADO RIVER COMPACT

13. This contract is made upon the express condition and with the express covenant that all rights of Arizona, its agencies and water users, to waters of the Colorado River and its tributaries, and the use of the same, shall be subject to and controlled by the Colorado River Compact signed at Santa Fe, New Mexico, November 24, 1922, pursuant to the Act of Congress approved August 19, 1921 (42 Stat. 171), as approved by the Boulder Canyon Project Act.

Appendix E

EFFECTIVE DATE OF CONTRACT

14. This contract shall be of no effect unless it is unconditionally ratified by an Act of the Legislature of Arizona, within three years from the date hereof, and further, unless within three years from the date hereof the Colorado River Compact is unconditionally ratified by Arizona. When both ratifications are effective, this contract shall be effective.

INTEREST IN CONTRACT NOT TRANSFERABLE

15. No interest in or under this contract, except as provided by Article 7(*l*), shall be transferable by either party without the written consent of the other.

APPROPRIATION CLAUSE

16. The performance of this contract by the United States is contingent upon Congress making the necessary appropriations for expenditures for the completion and the operation and maintenance of any dams, power plants or other works necessary to the carrying out of this contract, or upon the necessary allotments being made therefor by any authorized federal agency. No liability shall accrue against the United States, its officers, agents, or employees by reason of the failure of Congress to make any such appropriations or of any federal agency to make such allotments.

MEMBER-OF-CONGRESS CLAUSE

17. No Member of or Delegate to Congress or Resident Commissioner shall be admitted to any share or part of this contract or to any benefit that may arise herefrom, but this restriction shall not be construed to extend to this contract if made with a corporation or company for its general benefit.

Appendix E

DEFINITIONS

18. Wherever terms used herein are defined in Article II of the Colorado River Compact or in Section 12 of the Boulder Canyon Project Act, such definitions shall apply in construing this contract.

19. In witness whereof the parties hereto have caused this contract to be executed the day and year first above written.

THE UNITED STATES OF AMERICA,

By (s) HAROLD L. ICKES,
Secretary of the Interior.

STATE OF ARIZONA, acting by and through its COLORADO RIVER COMMISSION,

By (s) HENRY S. WRIGHT, *Chairman.*

By (s) NELLIE T. BUSH, *Secretary.*

Approved this 11th day of February 1944:

(s) SIDNEY P. OSBORN,
Governor of the State of Arizona.

APPENDIX F

Nevada Contract of March 30, 1942

APPENDIX F

Nevada Contract of March 30, 1942

UNITED STATES DEPARTMENT OF THE INTERIOR

BUREAU OF RECLAMATION

BOULDER CANYON PROJECT

ARIZONA-CALIFORNIA-NEVADA

CONTRACT FOR DELIVERY OF WATER

1. THIS CONTRACT, made this 30th day of March, nineteen hundred forty-two, pursuant to the Act of Congress approved June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplementary thereto, all of which acts are commonly known and referred to as the Reclamation Law, and particularly pursuant to the Act of Congress approved December 21, 1928 (45 Stat. 1057), designated the Boulder Canyon Project Act, and acts amendatory thereof or supplementary thereto, between THE UNITED STATES OF AMERICA (hereinafter referred to as "United States"), acting for this purpose by Abe Fortas, Acting Secretary of the Interior (hereinafter referred to as the "Secretary"), and the STATE OF NEVADA, a body politic and corporate, and its Colorado River Commission (said Commission acting in the name of the State, but as principal in its own behalf as well as in behalf of the State; the term State as used in this contract being deemed to be both the State of Nevada and its Colorado River Commission), acting in pursuance of an act of the Legislature of the State of Nevada, entitled "An Act creating a commission to be known as the Colorado river commission of Nevada, defining its powers and duties, and making an appropriation for the expenses thereof, and repealing all acts and parts of acts in conflict with this act," approved March 20, 1935 (Chapter 71, Stats. of Nevada, 1935);

Appendix F

Witnesseth that:

EXPLANATORY RECITALS

2. Whereas for the purpose of controlling floods, improving navigation, regulating the flow of the Colorado River, providing for storage and for the delivery of stored waters for the reclamation of public lands and other beneficial uses exclusively within the United States, the Secretary, acting under and in pursuance of the provisions of the Colorado River Compact and the Boulder Canyon Project Act, and acts amendatory thereof or supplementary thereto, has constructed and is now operating and maintaining in the main stream of the Colorado River at Black Canyon that certain structure known as and designated Boulder Dam and incidental works, creating thereby a reservoir designated Lake Mead; and

3. Whereas the State is desirous of entering into a contract for the delivery to it of water from Lake Mead:

4. Now, therefore, in consideration of the mutual covenants herein contained, the parties hereto agree as follows, to wit:

DELIVERY OF WATER BY THE UNITED STATES

5. (a) Subject to the availability thereof for use in Nevada under the provisions of the Colorado River Compact and the Boulder Canyon Project Act, the United States shall, from storage in Lake Mead, deliver to the State each year at a point or points to be selected by the State and approved by the Secretary, so much water as may be necessary to supply the State a total quantity not to exceed One Hundred Thousand (100,000) acre-feet each calendar year. The right of the State to contract for the delivery to it from storage in Lake Mead of additional water is not limited by this contract. Said water may be used only within the

State of Nevada, exclusively for irrigation, household, stock, municipal, mining, milling, industrial, and other like purposes, but shall not be used for the generation of electric power.

(b) Water agreed to be delivered to the State hereunder shall be delivered continuously as far as reasonable diligence will permit, but the United States shall not be obligated to deliver water to the State when for any reason, as conclusively but not arbitrarily determined by the Secretary, such delivery would interfere with the use of Boulder Dam or Lake Mead for river regulation, improvement of navigation, flood control, and/or satisfaction of perfected rights, in or to the waters of the Colorado River, or its tributaries, in pursuance of Article VIII of the Colorado River Compact.

(c) The United States reserves the right, for the purpose of investigation, inspection, maintenance, repairs and replacement or installation of equipment or machinery at Boulder Dam, to discontinue temporarily or reduce the amount of water to be delivered hereunder, but so far as feasible the United States will give the State reasonable notice in advance of such temporary discontinuance or reduction. The United States, its officers, agents, and employees shall not be liable for damages when, for any reason whatsoever, suspensions or reductions in delivery of water occur.

(d) This contract is for permanent service, and is made subject to the express condition that the State, upon request of the Secretary, shall submit in writing prior to January 1st of any year, an estimate of the amount of water to be required under this contract for the succeeding calendar year.

RECEIPT OF WATER BY THE STATE

6. The State shall receive the water to be diverted by or delivered to it by the United States under the terms hereof

at the point or points of delivery to be hereafter designated as stated in the next preceding article hereof, and shall perform all acts required by law or custom in order to maintain control over such water and to secure and maintain its lawful use and proper diversion from Lake Mead. The diversion and conveyance of such water to places of use shall be without expense to the United States.

MEASUREMENT OF WATER

7. The water to be delivered to the State hereunder shall be measured at the point or points of diversion from Lake Mead, or at such point or points in any works used by the State to convey water from Lake Mead to its place or places of use as shall be satisfactory to the Secretary, and by such measuring and controlling devices or such automatic gauges or otherwise as shall be satisfactory to the Secretary. Said measuring and controlling devices, or automatic gauges, shall be furnished, installed, and maintained in manner satisfactory to the Secretary, by and at the expense of the State, but they shall be and remain at all times under the complete control of the United States. The State's authorized representative shall be allowed access at all times to said measuring and controlling devices or automatic gauges.

RECORD OF WATER DIVERTED

8. The State shall make full and complete written monthly reports as directed by the Secretary on forms to be supplied by the United States of all water delivered to or diverted by the State from Lake Mead. Such reports shall be made by the fifth day of the month immediately succeeding the month in which the water is diverted.

CHARGE FOR DELIVERY OF WATER

9. A charge of fifty cents ($.50) per acre-foot shall be made for the diversion by or delivery of water to the State

hereunder during the Boulder Dam cost-repayment period, subject to reduction by the Secretary in the amount of the charge if studies show to his satisfaction that the charge is too high. Thereafter, charges shall be on such basis as may hereafter be prescribed by the Congress. Charges shall be made against the State only for the number of acre-feet of water actually delivered to or diverted by it from Lake Mead.

BILLING AND PAYMENTS

10. The State shall pay monthly for all water delivered to it hereunder, or diverted by it from Lake Mead, in accordance with the charge in Article nine (9) hereof established. The United States will submit bills to the State by the tenth day of each month immediately following the month during which the water is delivered or diverted and payments shall be due on the first day of the month immediately succeeding. If such charges are not paid when due, an interest charge of one per centum (1%) of the amount unpaid shall be added thereto as liquidated damages and, thereafter, as further liquidated damages, an additional interest charge of one per centum (1%) of the principal sum unpaid shall be added on the first day of each succeeding calendar month until the amount due, including such interest, is paid in full.

REFUSAL OF WATER IN CASE OF DEFAULT

11. The United States reserves the right to refuse to deliver water to the State, or to permit water to be diverted by the State from Lake Mead, in the event of default for a period of more than twelve (12) months in any payment due or to become due to the United States under this contract.

INSPECTION BY THE UNITED STATES

12. The Secretary or his representatives shall at all times have the right of ingress to and egress from all

works of the State for the purpose of inspection, repairs, and maintenance of works of the United States, and for all other proper purposes. In each contract made by the State for the redelivery of any part of the water agreed to be delivered to the State hereunder, it shall be provided, for the use and benefit of the United States, that the authorized representatives of the United States shall at all times have access to measuring and controlling devices, or automatic gauges, over the lands and rights of way of the contractee. The Secretary or his representatives shall also have free access at all reasonable times to the books and records of the State relating to the diversion and distribution of water delivered to or diverted by the State from Lake Mead with the right at any time during office hours to make copies of or from the same.

RULES AND REGULATIONS

13. There is reserved to the Secretary the right to prescribe and enforce rules and regulations governing the delivery and diversion of water hereunder. Such rules and regulations may be modified, revised, and/or extended from time to time after notice to the State and opportunity for it to be heard, as may be deemed proper, necessary, or desirable by the Secretary to carry out the true intent and meaning of the law and of this contract, or amendments hereof, or to protect the interests of the United States. The State hereby agrees that in the operation and maintenance of its diversion works and conduits, all such rules and regulations will be fully adhered to.

AGREEMENT SUBJECT TO COLORADO RIVER COMPACT

14. This contract is made upon the express condition and with the express understanding that all rights hereunder shall be subject to and controlled by the Colorado River Compact, being the compact or agreement signed at

Appendix F

Santa Fe, New Mexico, November 24, 1922, pursuant to an Act of Congress approved August 19, 1921, entitled "An Act to permit a compact or agreement between the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, respecting the disposition and apportionment of the waters of the Colorado River, and for other purposes," which compact was approved in section 13 (a) of the Boulder Canyon Project Act.

PRIORITY CLAIMS OF THE UNITED STATES

15. Claims of the United States arising out of this contract shall have priority over all others, secured or unsecured.

CONTRACT CONTINGENT UPON APPROPRIATIONS

16. This contract is subject to appropriations being made by Congress from time to time of money sufficient to provide for the doing and performance of all things on the part of the United States to be done and performed under the terms hereof, and to there being sufficient money available in the Colorado River Dam Fund for such purposes. No liability shall accrue against the United States, its officers, agents, or employees, by reason of sufficient money not being so appropriated, or on account of there not being sufficient money in the Colorado River Dam Fund for such purposes.

EFFECT OF WAIVER OF BREACH OF CONTRACT

17. All rights of action for breach of any of the provisions of this contract are reserved to the United States as provided in Section 3737 of the Revised Statutes of the United States. The Waiver of a breach of any of the provisions of this contract shall not be deemed to be a waiver of any provision hereof, or of any other subsequent breach of any provision hereof.

Appendix F

REMEDIES UNDER CONTRACT NOT EXCLUSIVE

18. Nothing contained in this contract shall be construed as in any manner abridging, limiting, or depriving the United States or the State of any means of enforcing any remedy either at law or in equity for the breach of any of the provisions hereof which it would otherwise have.

TRANSFER OF INTEREST IN CONTRACT

19. No voluntary transfer of this contract, or of the rights of the State hereunder, shall be made without the written approval of the Secretary; and any successor or assign of the rights of the State, whether by voluntary transfer, judicial sale, trustee's sale, or otherwise, shall be subject to all the conditions of the Boulder Canyon Project Act, and also subject to all the provisions and conditions of this contract to the same extent as though such successor or assign were the original contractor hereunder; provided, that the execution of a mortgage or trust deed, or judicial or trustee's sale made thereunder, shall not be deemed a voluntary transfer within the meaning of this Article.

NOTICES

20. (a) Any notice, demand, or request required or authorized by this contract to be given or made to or upon the United States shall be delivered, or mailed postage prepaid, to the Director of Power, United States Bureau of Reclamation, Boulder City, Nevada, except where, by the terms hereof, the same is to be given or made to or upon the Secretary, in which event it shall be delivered, or mailed postage prepaid, to the Secretary, at Washington, D. C.

(b) Any notice, demand or request required or authorized by this contract to be given or made to or upon the State shall be delivered, or mailed postage prepaid, to the Secretary of the Colorado River Commission of Nevada, Carson City, Nevada.

(c) The designation of any person specified in this article or in any such request for notice, or the address of any such person, may be changed at any time by notice given in the same manner as provided in this article for other notices.

OFFICIALS NOT TO BENEFIT

21. No Member of or Delegate to Congress or Resident Commissioner shall be admitted to any share or part of this contract or to any benefit that may arise herefrom, but this restriction shall not be construed to extend to this contract if made with a corporation or company for its general benefit.

UNCONTROLLABLE FORCES

22. Neither party shall be considered to be in default in respect to any obligation hereunder, if prevented from fulfilling such obligation by reason of uncontrollable forces, the term "uncontrollable forces" being deemed, for the purposes of this contract, to mean any cause beyond the control of the party affected, including but not limited to inadequacy of water, failure of facilities, flood, earthquake, storm, lightning, fire, epidemic, war, riot, civil disturbance, labor disturbance, sabotage, and restraint by court or public authority, which by exercise of due diligence and foresight, such party could not reasonably have been expected to avoid. Either party rendered unable to fulfill any obligation by reason of uncontrollable forces shall exercise due diligence to remove such inability with all reasonable dispatch.

In witness whereof the parties hereto have caused this contract to be executed the day and year first above written.

Nevada Contract of January 3, 1944

UNITED STATES DEPARTMENT OF THE INTERIOR

BUREAU OF RECLAMATION

BOULDER CANYON PROJECT

ARIZONA-CALIFORNIA-NEVADA

SUPPLEMENTAL CONTRACT FOR DELIVERY OF WATER

1. THIS SUPPLEMENTAL CONTRACT made this 3rd day of January nineteen hundred forty-four, pursuant to the Act of Congress approved June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplementary thereto, all of which acts are commonly known and referred to as the Reclamation Law, and particularly pursuant to the Act of Congress approved December 21, 1928 (45 Stat. 1057), designated the Boulder Canyon Project Act, and acts amendatory thereof or supplementary thereto, between THE UNITED STATES OF AMERICA (hereinafter referred to as "United States"), acting for this purpose by Harold L. Ickes, Secretary of the Interior (hereinafter styled "Secretary"), and STATE OF NEVADA, a body politic and corporate, and its Colorado River Commission (said Commission acting in the name of the State, but as principal in its own behalf as well as in behalf of the State; the term State as used in this supplemental contract being deemed to be both the State of Nevada and its Colorado River Commission), acting in pursuance of an act of the Legislature of the State of Nevada, entitled "An Act creating a commission to be known as the Colorado river commission of Nevada, defining its powers and duties, and making an appropriation for the expenses thereof, and repealing all acts and parts of acts in conflict with this act," approved March 20, 1935 (Chapter 71, Stats. of Nevada, 1935);

Witnesseth:

Appendix G

EXPLANATORY RECITALS

2. Whereas, under date of March 30, 1942, the parties hereto entered into a contract providing, among other things, for the delivery of water to the State each year, from storage in Lake Mead, subject to the availability thereof for use in Nevada under the provisions of the Colorado River Compact and the Boulder Canyon Project Act, so much water as may be necessary to supply the State a total quantity not to exceed One Hundred Thousand (100,000) acre-feet each calendar year, and it is now desired to amend said contract so as to provide for the delivery each calendar year of not to exceed an additional 200,000 acre-feet of water to the State;

3. Now, therefore, in consideration of the mutual covenants herein contained, the parties hereto agree as follows, to wit:

DELIVERY OF WATER BY THE UNITED STATES

4. Article 5 (a) of the aforesaid contract of date March 30, 1942, is hereby amended to read as follows:

"Subject to the availability thereof for use in Nevada under the provisions of the Colorado River Compact and the Boulder Canyon Project Act, the United States shall, from storage in Lake Mead, deliver to the State each year at a point or points to be selected by the State and approved by the Secretary, so much water, including all other waters diverted for use within the State of Nevada from the Colorado River system, as may be necessary to supply the State a total quantity not to exceed Three Hundred Thousand (300,000) acre-feet each calendar year. Said water may be used only within the State of Nevada, exclusively for irrigation, household, stock, municipal, mining, milling, industrial, and other like purposes, but shall not be used for the generation of electric power."

Appendix G

MODIFICATION OF PRIOR CONTRACT

5. Except as expressly herein amended, the aforesaid contract of date March 30, 1942, shall be and remain in full force and effect.

EFFECTIVE DATE OF SUPPLEMENTAL CONTRACT

6. This supplemental contract shall be of full force and effect immediately upon its execution for and on behalf of the United States.

OFFICIALS NOT TO BENEFIT

7. No Member of or Delegate to Congress or Resident Commissioner shall be admitted to any share or part of this contract or to any benefit that may arise herefrom, but this restriction shall not be construed to extend to this contract if made with a corporation or company for its general benefit.

In witness whereof, the parties hereto have caused this supplemental contract to be executed the day and year first above written.

APPENDIX H

Palo Verde Irrigation District Contract of February 7, 1933

APPENDIX H

Palo Verde Irrigation District Contract of February 7, 1933

UNITED STATES DEPARTMENT OF THE INTERIOR

BUREAU OF RECLAMATION

BOULDER CANYON PROJECT

UNITED STATES AND PALO VERDE IRRIGATION DISTRICT CONTRACT FOR DELIVERY OF WATER

(1) THIS CONTRACT, made this 7th day of February nineteen hundred thirty-three, pursuant to the Act of Congress approved June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplementary thereto, all of which acts are commonly known and referred to as the reclamation law, and particularly pursuant to the Act of Congress approved December 21, 1928 (45 Stat. 1057), designated the Boulder Canyon Project Act, between THE UNITED STATES OF AMERICA, hereinafter referred to as the United States acting for this purpose by Harold L. Ickes, Secretary of the Interior, hereinafter styled the Secretary, and PALO VERDE IRRIGATION DISTRICT, an irrigation district created, organized, and existing under and by virtue of an act of the Legislature of the State of California approved June 21, 1923 (Chapter 452, Statutes of California, 1923), as amended, known as and designated "Palo Verde irrigation district act", with its principal office at Blythe, Riverside County, California, hereinafter referred to as the District;

Witnesseth:

EXPLANATORY RECITALS

(2) Whereas, for the purpose of controlling the floods, improving navigation and regulating the flow of the Colorado River, providing for storage and for the delivery of the stored waters for reclamation of public lands and other

beneficial uses exclusively within the United States, the Secretary, subject to the terms of the Colorado River Compact, is authorized to construct, operate and maintain a dam and incidental works in the main stream of the Colorado River at Black Canyon or Boulder Canyon, adequate to create a storage reservoir of a capacity of not less than twenty million acre-feet of water; and

(3) Whereas, after full consideration of the advantages of both the Black Canyon and Boulder Canyon dam sites, the Secretary has determined upon Black Canyon as the site of the aforesaid dam, hereinafter styled the Hoover Dam, creating thereby a reservoir to be hereinafter styled the Boulder Canyon Reservoir; and

(4) Whereas, the District is desirous of entering into a contract for the delivery to it of water from Boulder Canyon Reservoir, and it is to the mutual interest of the parties hereto that such contract be executed and the rights of the District in and to waters of the river be hereby defined.

(5) Now, therefore, in consideration of the mutual covenants herein contained, the parties hereto agree as follows, to wit:

DELIVERY OF WATER BY THE UNITED STATES

(6) The United States shall, from storage available in the Boulder Canyon Reservoir, deliver to the District each year at a point in the Colorado River immediately above the District's point of diversion known as Blythe Intake (or as relocated within two miles of the present intake) so much water as may be necessary to supply the District a total quantity, including all other waters diverted for use of the District from the Colorado River, in the amounts and with priorities in accordance with the recommendation of the Chief of the Division of Water Resources of the State of California, as follows (subject to availability thereof for

use in California under the Colorado River Compact and the Boulder Canyon Project Act):

"The waters of the Colorado River available for use within the State of California under the Colorado River Compact and the Boulder Canyon Project Act shall be apportioned to the respective interests below named and in amounts and with priorities therein named and set forth, as follows:

"SECTION 1. A first priority to Palo Verde Irrigation District for beneficial use exclusively upon lands in said District as it now exists and upon lands between said District and the Colorado River, aggregating (within and without said District) a gross area of 104,500 acres, such waters as may be required by said lands.

"SEC. 2. A second priority to Yuma Project of the United States Bureau of Reclamation for beneficial use upon not exceeding a gross area of 25,000 acres of land located in said project in California, such waters as may be required by said lands.

"SEC. 3. A third priority (a) to Imperial Irrigation District and other lands under or that will be served from the All-American Canal in Imperial and Coachella Valleys, and (b) to Palo Verde Irrigation District for use exclusively on 16,000 acres in that area known as the 'Lower Palo Verde Mesa,' adjacent to Palo Verde Irrigation District, for beneficial consumptive use, 3,850,000 acre-feet of water per annum less the beneficial consumptive use under the priorities designated in Sections 1 and 2 above. The rights designated (a) and (b) in this section are equal in priority. The total beneficial consumptive use under priorities stated in Sections 1, 2, and 3 of this article shall not exceed 3,850,000 acre-feet of water per annum.

"SEC. 4. A fourth priority to the Metropolitan Water District of Southern California and/or the City of Los

Angeles. for beneficial consumptive use, by themselves and/or others, on the Coastal Plain of Southern California, 550,000 acre-feet of water per annum.

"SEC. 5. A fifth priority (a) to The Metropolitan Water District of Southern California and/or the City of Los Angeles, for beneficial consumptive use, by themselves and/or others, on the Coastal Plain of Southern California, 550,000 acre-feet of water per annum and (b) to the City of San Diego and/or County of San Diego, for beneficial consumptive use, 112,000 acre-feet of water per annum. The rights designated (a) and (b) in this section are equal in priority.

"SEC. 6. A sixth priority (a) to Imperial Irrigation District and other lands under or that will be served from the All-American Canal in Imperial and Coachella Valleys, and (b) to Palo Verde Irrigation District for use exclusively on 16,000 acres in that area known as the 'Lower Palo Verde Mesa,' adjacent to Palo Verde Irrigation District, for beneficial consumptive use, 300,000 acre-feet of water per annum. The rights designated (a) and (b) in this section are equal in priority.

"SEC. 7. A seventh priority of all remaining water available for use within California, for agricultural use in the Colorado River Basin in California, as said basin is designated on Map No. 23000 of the Department of the Interior, Bureau of Reclamation.

"SEC. 8. So far as the rights of the allottees named above are concerned, the Metropolitan Water District of Southern California and/or the City of Los Angeles shall have the exclusive right to withdraw and divert into its aqueduct any water in Boulder Canyon Reservoir accumulated to the individual credit of said District and/or said City (not exceeding at any one time 4,750,000 acre-feet

in the aggregate) by reason of reducing diversions by said District and/or said City; provided, that accumulations shall be subject to such conditions as to accumulation, retention, release and withdrawal as the Secretary of the Interior may from time to time prescribe in his discretion, and his determination thereof shall be final; provided further, that the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between said District and/or said City and such users resulting therefrom.

"SEC. 9. In addition, so far as the rights of the allottees named above are concerned, the City of San Diego and/or County of San Diego shall have the exclusive right to withdraw and divert into an aqueduct any water in Boulder Canyon Reservoir accumulated to the individual credit of said City and/or said County (not exceeding at any one time 250,000 acre-feet in the aggregate) by reason of reduced diversions by said City and/or said County; provided, that accumulations shall be subject to such conditions as to accumulations, retention, release and withdrawal as the Secretary of the Interior may from time to time prescribe in his discretion, and his determination thereof shall be final; provided further, that the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between the said City and/or said County and such users resulting therefrom.

"SEC. 10. In no event shall the amounts allotted in this agreement to the Metropolitan Water District of Southern California and/or the City of Los Angeles be increased on account of inclusion of a supply for both said District and said City, and either or both may use said apportionments as may be agreed by and between said District and said City.

Appendix H

"SEC. 11. In no event shall the amounts allotted in this agreement to the City of San Diego and/or to the County of San Diego be increased on account of inclusion of a supply for both said City and said County, and either or both may use said apportionments as may be agreed by and between said City and said County.

"SEC. 12. The priorities hereinbefore set forth shall be in no wise affected by the relative dates of water contracts executed by the Secretary of the Interior with the various parties."

The Secretary reserves the right to, and the District agrees that he may, contract with any of the allottees above named in accordance with the above stated recommendation. The District reserves the right to establish, at any time, by judicial determination, its rights to divert and/or use water from the Colorado River. In the event the above stated recommendation as to the District is superseded by an agreement between all the above allottees or by a final judicial determination, the parties hereto reserve the right to further contract in accordance with such agreement or such judicial determination; *Provided*, that priorities numbered fourth and fifth shall not thereby be disturbed.

As far as reasonable diligence will permit said water shall be delivered as ordered by the District, and as reasonably required for potable and irrigation purposes within the areas for which the District is allotted water as described in the above-stated recommendation. This contract is for permanent water service but is subject to the condition that Hoover Dam and Boulder Canyon Reservoir shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of perfected rights in pursuance of Article VIII of the Colorado River Compact; and third, for power. This contract is made upon the express condition and with the express covenant that the District and the United States shall observe and be subject to, and

controlled by, said Colorado River Compact in the construction, management, and operation of Hoover Dam, and other works and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other purposes. The United States reserves the right to temporarily discontinue or reduce the amount of water to be delivered for the purpose of investigation, inspection, maintenance, repairs, replacements, or installation of equipment and/or machinery at Hoover Dam, but as far as feasible the United States will give the District reasonable notice in advance of such temporary discontinuance or reduction. The United States, its officers, agents, and employees shall not be liable for damages when, for any reason whatsoever, suspension or reductions in delivery of water occur. This contract neither prejudices nor admits any claim of the District on account of alleged changes in elevation of the river bed, howsoever caused, or the effect of such alleged changes on the District's diversion of water delivered hereunder. This contract is without prejudice to any other or additional rights which the District may now have not inconsistent with the foregoing provisions of this article, or may hereafter acquire in or to the waters of the Colorado River.

RECEIPT OF WATER BY DISTRICT

(7) The District shall receive the water to be delivered to it by the United States under the terms hereof at the point of delivery above stated, and shall at its own expense convey such water to its distribution system, and shall perform all acts required by law or custom in order to maintain its control over such water and to secure and maintain its lawful and proper diversion from the Colorado River.

MEASUREMENT OF WATER

(8) The water to be delivered hereunder shall be measured at Blythe Intake by such measuring and con-

trolling devices or such automatic gauges or both, as shall be satisfactory to the Secretary. Said measuring and controlling devices, or automatic gauges, shall be furnished, installed, and maintained by and at the expense of the District, but they shall be and remain at all times under the complete control of the United States, whose authorized representatives may at all times have access to them over the land and rights-of-way of the District.

RECORD OF WATER DIVERTED

(9) The District shall make full and complete written reports as directed by the Secretary, on forms to be supplied by the United States, of all water diverted from the Colorado River, and the disposition thereof. The records and data from which such reports are made shall be accessible to the United States on demand of the Secretary.

NO CHARGE FOR DELIVERY OF WATER

(10) The District shall not be required to pay to the United States any tolls, rates, or charges of any kind for or on account of the storage or delivery of water hereunder.

INSPECTION BY THE UNITED STATES

(11) The Secretary or his representatives, shall at all times have the right of ingress to and egress from all works of the District for the purpose of inspection, repairs and maintenance of works of the United States, and for all other proper purposes. The Secretary or his representatives shall also have free access at all reasonable times to the books and records of the District relating to the diversion and distribution of water delivered to it hereunder with the right at any time during office hours to make copies of or from the same.

Appendix H

DISPUTES OR DISAGREEMENTS

(12) Disputes or disagreements as to the interpretation or performance of the provisions of this contract shall be determined either by arbitration or court proceedings, the Secretary being authorized to act for the United States in such proceedings. Whenever a controversy arises out of this contract, and the parties hereto agree to submit the matter to arbitration, the District shall name one arbitrator and the Secretary shall name one arbitrator, and the two arbitrators thus chosen shall elect three other arbitrators, but in the event of their failure to name all or any of the three arbitrators within thirty (30) days after their first meeting, such arbitrators not so elected, shall be named by the Senior Judge of the United States Circuit Court of Appeals for the Ninth Circuit. The decision of any three of such arbitrators shall be a valid and binding award of the arbitrators.

RULES AND REGULATIONS

(13) There is reserved to the Secretary the right to prescribe and enforce rules and regulations not inconsistent with this contract, governing the diversion and delivery of water hereunder to the District and to other contractors. Such rules and regulations may be modified, revised and/or extended from time to time after notice to the District and opportunity for it to be heard, as may be deemed proper, necessary or desirable by the Secretary to carry out the true intent and meaning of the law and of this contract, or amendments thereof, or to protect the interests of the United States. The District hereby agrees that in the operation and maintenance of its diversion works at Blythe Intake, all such rules and regulations will be fully adhered to.

AGREEMENT SUBJECT TO COLORADO RIVER COMPACT

(14) This contract is made upon the express condition and with the express understanding that all rights based

upon this contract shall be subject to and controlled by the Colorado River Compact, being the compact or agreement signed at Santa Fe, New Mexico, November 24, 1922, pursuant to Act of Congress approved August 19, 1921, entitled "An Act to permit a compact or agreement between the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, respecting the disposition and apportionment of the waters of the Colorado River, and for other purposes", which compact was approved by the Boulder Canyon Project Act.

PRIORITY OF CLAIMS OF THE UNITED STATES

(15) Claims of the United States arising out of this contract shall have priority over all others, secured or unsecured.

CONTINGENT UPON APPROPRIATIONS

(16) This contract is subject to appropriations being made by Congress from year to year of moneys sufficient to do the work contemplated hereby, and to there being sufficient moneys available in the Colorado River Dam fund to permit allotments to be made for the performance of such work. No liability shall accrue against the United States, its officers, agents, or employees, by reason of sufficient moneys not being so appropriated nor on account of there not being sufficient moneys in the Colorado River Dam fund to permit of said allotments. This agreement is also subject to the condition that if for any reason construction of Hoover Dam is not prosecuted to completion with reasonable diligence, then and in such event either party hereto may terminate its obligations hereunder upon one (1) year's written notice to the other party hereto.

RIGHTS RESERVED UNDER SECTION 3737, REVISED STATUTES

(17) All rights of action for breach of any of the provisions of this contract are reserved to the United States as

provided in Section 3737 of the Revised Statutes of the United States.

REMEDIES UNDER CONTRACT NOT EXCLUSIVE

(18) Nothing contained in this contract shall be construed as in any manner abridging, limiting or depriving the United States or the District of any means of enforcing any remedy either at law or in equity for the breach of any of the provisions hereof which it would otherwise have. The waiver of a breach of any of the provisions of this contract shall not be deemed to be a waiver of any other provision hereof or of a subsequent breach of such provision.

INTEREST IN CONTRACT NOT TRANSFERABLE

(19) No interest in this agreement is transferable, and no sublease shall be made, by the District without the written consent of the Secretary, and any such attempted transfer or sublease shall cause this contract to become subject to annulment, at the option of the United States.

MEMBER OF CONGRESS CLAUSE

(20) No Member of or Delegate to Congress or Resident Commissioner, shall be admitted to any share or part of this contract, or to any benefit that may arise therefrom. Nothing, however, herein contained shall be construed to extend to this contract if made with a corporation for its general benefit.

Appendix H

In witness whereof, the parties hereto have caused this contract to be executed the day and year first above written.

ARIZONA'S LEGISLATIVE HISTORY OF SECTIONS 4(a), 5 (1ST PARAGRAPH), and 8 OF THE BOULDER CANYON PROJECT ACT

Introduction

This document is designed to present as far as possible the complete legislative history of Section 4(a), the first paragraph of Section 5* and Section 8 of the Boulder Canyon Project Act, commencing with the third Swing Johnson bill.**

In general, the evolution of these sections is treated chronologically. For convenience, Section 4(a) and the first paragraph of Section 5 are treated together as they were in the main considered together.

Since repeated reference is made during the course of congressional debate to the California-Nevada proposal of 1925, the Arizona counter proposal of 1925 and the recommendations of the Governors' Conference of 1927, these documents are attached as appendices.

This Legislative History is cited in Arizona's brief as "Ariz. Legis. Hist." followed by a page reference. In order that the Court, in reading the Master's Report, may be able to refer to the Master's references to Arizona's Legislative History, we have preserved by bold face bracketed page numbers the pagination of the Legislative History as it was submitted to the Master.

---

* The balance of this section deals with electric power and therefore is not considered pertinent.

** The evolution of Section 8 commenced with H. R. 6251 and that of Section 4(a) and the first paragraph of Section 5 with H. R. 9826 and S. 3331, all introduced in the 69th Congress.

[1]

Sections 4(a) and 5 (1st paragraph)

H.R. 9826 (69th Congress, 2nd Session), introduced by Representative Phil D. Swing on February 27, 1926 as a substitute for H.R. 6251 (his earlier bill), contained the following language for Sec. 4(a):

> "SEC. 4. (a) No work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, and no water rights shall be initiated hereunder, until the respective legislatures of at least six of the signatory States mentioned in section 12 hereof shall have approved the Colorado River Compact mentioned in said section 12, and shall have consented to a waiver of the provision of the first paragraph of article 11 of said compact making the same binding and obligatory when it shall have been approved by the legislatures of each of the seven signatory States, and until the President, by public proclamation, shall have declared that the said compact has been approved by and become binding and obligatory upon at least six of the signatory States."

In the Hearings before the House Committee on H.R. 9826 certain amendments were proposed (mainly by the Upper Basin States) and set forth in part in the committee print of April 10, 1926 (p. 91 of Hearings) and in full in the committee print of April 14, 1926 (p. 115 of Hearings). The Upper Basin amendment follows and consists of all after "provided" (Hearings p. 115):

> "SEC. 4. (a) No work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, and no water rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or

perfect any claims to the use of water pertinent to such works or structures until the States of California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have approved the Colorado River compact mentioned in section 12 hereof and shall have consented to a waiver of the provisions of the first paragraph of Article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States mentioned in said section 12, and shall have approved said compact without condition save that of such six-State approval, and until the President by public proclamation shall have so declared."

This section was reported out of the House Committee in this form. (At p. 145 *et seq.* of the Hearings, Delph Carpenter states this was designed to force compliance with the Colorado River Compact.)

[2]

Also in the 69th Congress, Senator Johnson introduced S. 3331 in which Sec. 4(a) was identical with that in H.R. 9826 and it underwent the same changes in Committee.

As was true with Sec. 4(a), the evolution of the first paragraph of Sec. 5 began with H.R. 9826 (69th Congress), the third Swing-Johnson bill introduced by Hon. Phil Swing on February 27, 1926. Sec. 5, as introduced, read:

"SEC. 5. That the said Secretary is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses, and delivery at the switchboard to municipal corporations, political subdivisions, and private corporations of electrical energy generated at said dam, upon charges that will provide revenue which, in addition to other revenues accruing to the said subfund under the reclamation law or hereunder,

will cover operation and maintenance expense of works constructed hereunder, interest on bonds after completion of the works, and provide for the amortization of said bonds within fifty years. Contracts respecting water for domestic uses may be for permanent service but subject to rights of prior appropriators."

The same language appeared in the companion bill introduced in the Senate by Senator Johnson on February 27, 1926.

The House Committee on Irrigation and Reclamation made certain changes in Sec. 5 at the suggestion of the Upper Basin group and others. (Stricken words deleted from original and italicized words added. (U.B.) means Upper Basin amendment. (Pro.) means proponent's amendment. (Conf.) means to conform to Treasury amendments.)

"SEC. 5. That the (U.B.) ~~said~~ Secretary (U.B.) *of the Interior* is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses, and delivery at the switchboard to municipal corporations, political subdivisions, and private corporations of electrical energy generated at said dam, upon charges that will provide revenue which, in addition to other revenues (Conf.) ~~accruing to the said subfund under the reclamation law or hereunder, will cover operation and maintenance expense of works constructed hereunder interest on bonds after~~

[3]

~~completion of the works, and provide for the amortization of said bonds within fifty years~~ *accruing under the reclamation law and under this act, will cover all expenses of operation and maintenance incurred by the United States on account of works constructed under this act and the payments to the United States under*

subdivision (b) of section 4. Contracts respecting water for (Pro.) *irrigation and* domestic uses (Pro.) ~~may~~ *shall* be for permanent service (U.B.), ~~but subject to rights of prior appropriators~~. *No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated.*"

This language appears in the committee prints of April 10 and April 14, 1926. (It should be noted that the original bill provided that only contracts for domestic use *may* be for permanent service but *subject to the rights of prior appropriators,* whereas the committee amendment struck the last clause and provided that contracts for *irrigation* and domestic use *shall* be for permanent service. The committee amendment also added the last sentence prohibiting use of stored water without a contract.)

Delph Carpenter of Colorado, appearing as a witness, discussed the proposed changes in Sec. 5 with particular emphasis on the addition of the last sentence (p. 161 *et seq.,* House Committee Hearings on H.R. 9826):

> "Referring to the amendments in the section just read, the upper States suggested a formal amendment at the beginning, on line 15, page 8, by striking out the word 'said' and after the word 'Secretary,' inserting the words 'of the Interior.'
>
> On page 9 the main amendment at the top is a Treasury Department amendment, submitted by that department.
>
> However, at the bottom of the first paragraph of section 5, beginning on line 10, are the words:
>
> > No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated.
>
> That amendment is proposed by the upper States for the fundamental reason I assigned at the outset of

my statement to-day, which is that we insist that no use occur by reason of this structure which may later be said to be independent of the compact and be asserted as adverse to the upper States. If the Secretary of the Interior should contract for the use of water to somebody in a manner that did not

[4]

obligate them to respect the compact, then they would later come in and say, 'we are not bound and we therefore disclaim any obligation under the compact,' and it would provoke litigation.

While the upper States do not fear the outcome of litigation, they do insist that they be protected by interstate compact from any unwarranted assertions or threats by the States of the lower basin against present or future development in the upper basin by reason of further development in the lower basin. Such uncertainties embarrass the upper States in encouraging private capital to develop their resources and the natural, just, and legitimate improvement of their territory.

Mr. Taylor. Colorado has had 25 years of litigation with Kansas and Wyoming over these matters, and other States have had trouble and we want to avoid it in the future if possible.

Mr. Carpenter. Yes; and that litigation has been unsatisfactory to all litigants, has put a cloud on the title of water rights of great river valleys and has worked no good to anyone. Nevertheless, it was effective in destroying development in the upper country until settled. After years of such foolish litigation the people of the lower States finally awakened to the fact that upper State development had resulted in headwater 'land storage' of the river supplies to the benefit of the lower States and without cost to the latter.

Mr. Hayden. Mr. Hopkins stated the other day that a number of the amendments asked for by the upper basin States might or might not be effective.

At least there is some doubt about their legality. It was suggested that if the State of Arizona filed a suit in the Supreme Court of the United States and thereby stopped the construction of the Boulder Canyon dam that would be just as effective protection to the upper basin as though the Congress approved these amendments. In other words, nothing would be done and therefore the upper basin States would lose no rights.

Mr. Carpenter. As I understand, your statement of Mr. Hopkins' ideas is a little broad. Unquestionably, a suit filed by the State of Arizona would tend to delay construction of the project, but you would not deny the fact that there should be a compact at an early date. A suit could not be as effective as the provisions of this bill, because the mere filing of suit would settle nothing.

Mr. Hayden. I am in thorough accord with your idea that the best way to avoid litigation and accomplish desirable results is by compacts or agreements wherein each of the States recognize the rights of the other States in order that all may receive a fair share of the benefits. I am convinced that it is a mistake to expect any profit from interstate lawsuits. The history of such suits in the Supreme Court proves that there is no advantage in them. Neither do I believe that anything is to be gained by seeking to have Congress enact legislation which takes away from a State the rights or benefits that it might otherwise secure from a development of this kind.

[5]

Mr. Carpenter. It is not our thought in insisting upon amendments to this bill to embarrass the State of Arizona or to put her in an unfavorable situation. Arizona has many problems in common with us. She is entitled to full protection. She is our friend and we insist on justice to her. We are not the proponents of this bill. We have always insisted upon a seven-State compact before construction of any further works

anywhere in the basin. But if Congress is to proceed now, then we insist on protective amendments.

Mr. Hayden. Without an understanding with the States of California and Nevada, should this bill pass, the water will be first applied to a beneficial use in California, and when the time comes for development in Arizona, my State may have no water.

Mr. Carpenter. What you have said is true in part, but I must respectfully disagree with any thought that, physically, California could legitimately beneficially use all the water of the river. There is too much. It is also true that, under this bill, the Secretary of the Interior could contract with water users in the State of Arizona for the use of water or power without let or hindrance, except that the party contracting with the United States would agree that his particular claim should be subordinate to the Colorado River compact, not subordinate to the rights of the State of California —simply subordinate to the rights of the upper States as defined in the compact.

Mr. Hayden. The purpose of this amendment is that no person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated.

Mr. Carpenter. 'Except by contract made as herein stated' means this: If the flow of the Colorado River is controlled and regulated by the construction of the Black Canyon Dam, and any person in the State of Arizona attempt to take any water out of the stream which has been discharged from the reservoir and is being carried in the stream bed, as a natural conduit, for delivery to lower users, this law would be brought into effect and he would be prevented from using any of that water independent of the Colorado River compact but unencumbered by any other condition for the benefit of California and Nevada. In other words, the compact does not disturb the rights between Arizona, California, and Nevada, inter sese, as to their portion of the water.

Mr. Swing. The water which is stored by the Government at its own expense would be disposed of by contract as provided in this bill. There should be that privilege given Arizona to secure water on the same terms as is afforded to Nevada and California.

Mr. Hayden. How tight would you tie Arizona?

Mr. Carpenter. The thought of this amendment is that any water stored in this reservoir under the terms of the compact, when released from storage shall be burdened by the compact wherever it goes. As far as water is concerned, existing claims of the lower

[6]

States are protected by the compact. Water must pass through this reservoir to take care of the present existing lower claims.

As to future development from the main river, we insist that water stored in this structure by the United States be stored and released upon the express condition that the persons who receive the water shall respect and do so under the compact. It has nothing to do with the interstate relations between Arizona and California.

Mr. Swing. And also they shall make a fair contribution to the burden of returning this money to the Treasury of the United States.

Mr. Carpenter. Yes; that goes without saying. Anybody benefiting from this reservoir should help pay.

Mr. Swing. Whether he lives in the State of Arizona or the State of California or the State of Nevada?

Mr. Leatherwood. It goes without saying that as to any use of the water of the Colorado River by the State of Arizona, so long as she remains without the compact, that part which she would use which is not part of the stored water of this proposed dam, would be wholly without any restriction so far as the Colorado River compact is concerned and would be adverse to the upper basin States.

Mr. Swing. That would be true as to present vested rights only.

Mr. Leatherwood. Any rights that may be initiated.

Mr. Carpenter. Your question is answered by the fact that as to future uses from the main stream of the river, all water going to those uses will be stored water because the reservoir is so large that it will store everything that comes. Under the compact it does not impair any established, perfected uses.

Mr. Leatherwood. The upper States would have a right to rely upon the fact that there can be no use made by the nonratifying States of the waters of the Colorado River that are not stored?

Mr. Carpenter. Generally speaking, yes. But there will be cases where people along the river would take and use the water, because it would be going by. They could take it on the Arizona side and use it. We have felt that whatever rights they acquired would not materially jeopardize us.

Mr. Hayden. Suppose that a group of individuals in my State should apply to the Arizona Water Commissioner for the right to divert water from the Colorado River and apply it to beneficial use on their lands, and the commissioner gave them all the rights he could under the laws of the State, how would you keep them from diverting the water if it was flowing by their lands?

Mr. Carpenter. It would be a navigable stream and under the jurisdiction of the Federal Government. The Secretary of War would

[7]

protect this structure. Again, other matters might enter in. However, I do not believe there will be any particular disposition to prevent them from taking the water. There is plenty of water down there if stored. We are not alarmed about claims against us by the State of Arizona. California is the State which will first take water.

Mr. Hudspeth. Where do you provide in the six-State compact for the distribution of water, as to Arizona, that is to be stored? What does she get?

Mr. Carpenter. There is no disposition as to Arizona. The so-called six-State compact is misleading. It refers to the six-State ratification of a seven-State compact.

Mr. Hudspeth. If you should store a certain amount of water there, and California should desire to take all of that water, could she do so?

Mr. Carpenter. Assuming she could use it all.

Mr. Arentz. And Arizona would not want hers for 20 years.

Mr. Carpenter. That would be a matter, in the first place, for the United States controlling this dam, to say.

Mr. Hudspeth. Is it controlled by this compact—taken out of the hands of the United States?

Mr. Carpenter. The rights of the State of Arizona are not prejudiced. She is not included or excluded. The door is open and she may either come in or stay out. So far as any rights she may have are concerned, of course, they are not impaired. She may continue to remain on the side line, looking on as it were, and taking such action as she may see fit to protect her own interest or she may join. Her quarrel is not with the upper States, but is a fear of future conditions between herself and California. It is a local situation. Under the compact we make no attempt to allocate between those three lower States. We allocate to the lower group so much water. We do the same with the four upper States.

In the upper country we had a controversy between New Mexico and Colorado over the La Platte River. We settled that by a local compact entered into immediately after and in harmony with the main compact. It is intended that these local problems, involving only two or more States, shall be settled by supplemental compacts. And so here we would leave to Arizona, California, and Nevada the disposition of the water

given to the lower basin under the Colorado River compact. They are now engaged in an attempt to arrive at a compact, and that endeavor should be encouraged. It is desired by all that such an agreement should be reached.

They should not be prejudiced in the sense of shutting them out from any ultimate benefits so long as they act in good faith. But they should not stand by and leave those below in peril. Reasonable speed is to be expected.

[8]

Mr. Hudspeth. Suppose California should appropriate all of the water, would not that all go to her to the detriment of the State of Arizona?

Mr. Carpenter. The best answer to that question is that it cannot be done. California could not possibly appropriate all of that water if she tried to do so. She would drown herself out. Physical inhibitions would come into play."

After certain other minor changes were made by the House Committee, the first paragraph of Sec. 5 was reported out as follows:

"SEC. 5. That the Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses, and delivery at the switchboard to municipal corporations, political subdivisions, and private corporations of electrical energy generated at said dam, upon charges that will provide revenue which, in addition to other revenue accruing under the reclamation law and under this Act, will in his judgment cover all expenses of operation and maintenance incurred by the United States on account of works constructed under this Act and the payments

to the United States under subdivision (b) of section 4. Contracts respecting water for irrigation and domestic uses shall be for permanent service. No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated."

S. 3331 underwent the same changes before the Senate Committee in the 69th Congress insofar as Sec. 5 is concerned.

The first suggestion of a limitation was made by Senator Ashurst (February 25, 1927) in an amendment proposed to Sec. 5 of S. 3331 which would restrict the authority of the Secretary of the Interior to contract as follows:

"*Provided,* That the Secretary of the Interior in the delivery of water shall limit the amounts used in Arizona and California so that neither of said States shall use in excess of one-half of the water available in the lower basin out of the main Colorado River after three hundred thousand acre-feet has been deducted for use within the State of Nevada."

No action was taken on this proposal and the 69th Congress adjourned without passing either H.R. 9826 or S. 3331.

In the 70th Congress, Mr. Swing introduced H.R. 5773 in which Sec. 4(a) was included without change in language (except for one typo)

[9]

from that approved by the House Committee in the 69th Congress. No amendment was made in committee, except to correct the typo.

No change was made in Sec. 4(a) on the House floor. H.R. 5773 was passed and sent to the Senate during the 1st Session of the 70th Congress.

Senator Johnson's companion bill (S. 728) contained a radical change requiring only *four*-state ratification of the Colorado River Compact. This was amended in committee to restore *six*-state ratification as follows (stricken in original; italicized "*five*" in amendment):

> "SEC. 4. (a) No work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, and no water rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or perfect any claims to the use of water pertinent to such works or structures until the State of California and at least ~~three~~ *five* of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have approved the Colorado River compact mentioned in section 12 hereof and shall have consented to a waiver of the provisions of the first paragraph of Article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States mentioned in said section 12, and shall have approved said compact without condition save that of such approval by the State of California and at least ~~three~~ *five* of the other States mentioned and until the President by public proclamation shall have so declared."

The next suggestion of a limitation on California uses appeared in an amendment to Sec. 5 (not Sec. 4(a)) of S. 728 as reported out (on March 20, 1928) by the Senate Committee. The amendment appears in the italicized words following "Provided":

> "SEC. 5. That the Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses, *and generation*

of electrical energy and delivery at the switchboard to *States,* municipal corporations, political subdivisions, and private corporations of electrical energy generated at said dam, upon charges that will provide revenue which, in addition to other revenue accruing under the reclamation law and under this Act, will in his judgment cover all expenses of operation and maintenance incurred by the United States on account of works constructed under this Act and the payments to the United

[10]

States under subdivision (b) of section 4. Contracts respecting water for irrigation and domestic uses shall be for permanent service: *Provided, however, That said contracts shall not provide for an aggregate annual consumptive use in California of more than 4,600,000 acre-feet of the water allocated to the Lower Basin by the Colorado River compact mentioned in section 12 and one-half of the unallocated, excess and/or surplus water: Provided, further, That no such contracts shall be made until California, by act of its legislature, shall have ratified and approved the foregoing provision for use of water in said State.* No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated."

On April 26, 1928, Senator Johnson discussed the foregoing amendment to Sec. 5 (69 Cong. Rec. 7250):

"Section 5 provides that the contract must be general for storage and delivery of water and the Secretary shall fix charges to meet the revenue requirements, and that contracts for irrigation and domestic uses must be for permanent service. An amendment has been inserted there at the request of the upper basin States, offered, I think, in the committee, by the Senator from Wyoming which provides that—

Provided, however, That said contracts shall not provide for an aggregate annual consumptive use in California of more than 4,600,000 acre-feet of the water allocated to the lower basin by the Colorado River compact mentioned in section 12 and one-half of the unallocated, excess, and/or surplus water:

Provided further, That no such contracts shall be made until California, by act of its legislature, shall have ratified and approved the foregoing provision for use of water in said State.

That is another rigorous provision, a rigorous provision to which those who represented California were willing to consent in order that legislation might be accorded, but binding California perpetually and forever to a use not to exceed 4,600,000 acre-feet of water.

I repeat and repeat how we have endeavored to protect these upper basin States. We write the bill around the compact, we make every drop of water that comes from the storage and the regulation of the Colorado River under this scheme subject to the compact. We write, then, that California shall use perpetually only a specific amount of water, naming the maximum amount which may be used.

All these things are done in the good-faith endeavor to protect in every possible way the States of the upper basin and those who claim that they want protection under the Colorado River compact. Yet some of them would prefer to let this water continue to flow down to the sea for an indefinite period, to go to waste in the Gulf of California, the land remain in drought to the detriment of people in southern Arizona and southern California, to permit that to be

done indefinitely, rather than to permit the measure of protection—and it is a full measure of protection that is accorded them—under this bill."

Also during the 1st Session of the 70th Congress the Senate received certain amendments to S. 728 on which no action was taken in that session. The first (to Sec. 5 but relating to a limitation) was by Senator Waterman on March 27, 1928, which was printed, but not offered. It limited the authority of the Secretary to contract, as follows:

> "On page 7, line 9, strike out the words 'That no', together with the following lines numbered 10, 11, and ending with the words in line 12, to wit 'in said State', and insert in lieu thereof: 'That no such contracts nor any contract whatever, of any kind, shall be made under any provision of this Act until and unless the State of California, by a valid and binding act of its legislature, approved by its governor, shall have first ratified and approved all the provisions of this section of this Act, in any way relating to the use of the waters of the main stream of the Colorado River within or by the State of California, or by any person or corporation of said State, and shall also in and by such act of its legislature, solemnly declare and agree, as an express covenant and in express consideration of the passage of this Act, that any and all water demanded and required, or lawfully appropriated and applied to a beneficial use by the State of Arizona or any of its inhabitants, including corporations, municipal or otherwise, or any of them, out of the main stream of the Colorado River at any time in excess of two million nine hundred thousand acre-feet, per annum, plus one-half of the said unallocated excess and/or surplus water, will be furnished and supplied by the said State of California exclusively out of the said four million six hundred thousand acre-feet of water and said one-half of the said unallocated water last aforesaid, so that in no event shall there ever be demanded or required, out of the main stream of the Colorado River, by the States of Arizona, California, and Nevada, or either of them, any water in excess of the amount apportioned

to them by Article III of the Colorado River compact, to be delivered to them, or any of them, at Lee Ferry designated in said Colorado River compact or elsewhere.'"

The next amendment was printed (but not offered) by Senator Bratton on April 20, 1928—to Sec. 4(a):

"SEC. 4. (a) This Act shall not take effect, and no authority shall be exercised hereunder, unless and until (1) the States of California, Colorado, Nevada, New Mexico, Utah, Arizona, and Wyoming shall have ratified the Colorado River compact mentioned in section 12 hereof, and the President, by public proclamation, shall have so declared, or (2) if after one year from the date of the passage of this Act the said States shall fail to ratify the said compact, then six

[12]

States, including the State of California, shall ratify said compact, and shall consent to waive the provisions of the first paragraph of Article II of said compact, which makes the same binding and obligatory only when approved by each of the seven States mentioned in said section 12, and shall have approved said compact without conditions, save that of such six States' approval, and the President, by public proclamation, shall have so declared: *Provided,* however, That if ratification should be upon a six-State basis, then California shall agree in the ratifying Act that the aggregate annual consumptive use in California of waters of the Colorado River shall never exceed four million two hundred thousand acre-feet, and that the use by California of the excess or surplus waters unallocated by the Colorado River compact shall never exceed annually one-half of such excess or surplus waters, such use always to be subject to the terms of the Colorado River compact."

The next amendment to Sec. 4(a) was printed by Senator Phipps on April 20, 1928 as follows:

"On page 5, strike out lines 7 to 10 inclusive, and insert in lieu thereof the following 'until the Colorado River compact, mentioned in section 12 hereof, shall have been approved by the Seven States signatory thereto or until the State of California and at least five of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have approved said compact and shall have consented to a.' "

On May 3, 1928 there was printed the first so-called Phipps Amendment to Sec. 4(a), deleting the limitation language in Sec. 5 but adding the "shall conform to 4(a)" to Sec. 5, which limited the Secretary's authority to contract.

"SEC. 4 (a). This Act shall not take effect and no authority shall be exercised hereunder and no work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, and no water rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or perfect any claims to the use of water pertinent to such works or structures unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River Compact, mentioned in section 12 hereof, and the President by public proclamation shall have so declared, or (2) if said States fail to ratify the said compact within one year from the date of the passage of this Act, then, until six of said States, including the State of California, shall ratify said compact and shall consent to waive the provisions of the first paragraph of Article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven states signatory thereto, and shall have approved said compact

without conditions, save that of such six State approval, and the President by public proclamation shall have

so declared, and, further, until the State of California, by Act of its legislature, shall agree with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this Act, that the aggregate annual diversions of water of and from the Colorado River for use in the State of California, including all diversions under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million six hundred thousand acre-feet of the waters apportioned to the Lower Basin States by the Colorado River Compact and/or more than one-half of any excess or surplus waters unapportioned by said compact, such diversions always to be subject to the terms of said compact.

On page 7, strike out lines 4 to 12, inclusive, and insert in lieu thereof the following: 'permanent service and shall conform to paragraph (a) of section 4 of this Act. No person shall.' "

On May 28, 1928 (69 Cong. Rec. 10259) Senator Pittman (Nev.) discussed the recommendations of the Governors' Conference and stated that Nevada accepted those terms. He asked that an amendment to Sec. 4(a) drawn by Mr. Wilson of New Mexico be printed in the record, although he did not suggest action on the proposal. His discussion follows:

"Now, briefly, I desire to refer to another phase of this question. I have opposed final adjournment; I still believe if we shall be given sufficient time we may bring about action on the Boulder Dam bill. My fear has been, there being so many other matters before the Senate which Senators think of importance, and on which time is taken in discussion, that delay might eventually cause Senators to leave. Let me say that the States of Arizona, California, and Nevada are not

very far apart on any of the questions involved. We spent four weeks at Denver, Colo., last summer and last autumn discussing them. At that time California's representative and Arizona's representative presented to a commission representing the seven Colorado River States their position. California asked Arizona, 'If we agree on the equitable distribution of the benefits of the power development will you then be satisfied?' Arizona said, 'If you will agree on two things, the equitable distribution of water and of power; yes.' So they worked for weeks. I say that the question of power distribution has already been agreed upon; that is out of the way. The two power provisions, which I offered in committee as an amendment to the bill of the Senator from California (Mr. Johnson) and which were reported out favorably by the Senate committee, were also reported out favorably by the House committee and are now included in the House bill as it comes over here.

[14]

Those provisions satisfied Nevada and those provisions satisfied the people of Arizona. So we have nothing but a question of the division of water that separates the two States. Nevada is not complaining about water; she has always accepted the little handful of water that has been given her; but when we assembled at Denver the governors of the four upper Colorado River Basin States, trying to reconcile the difference on water between California and Arizona, finally made this proposition:

	Acre feet of water
California	4,200,000
Arizona	3,000,000
Nevada	300,000

How did they get at that? Under what is called the seven-state agreement we find this clause in Article III:

(a) There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

In other words, those State governors believed that there was only 7,500,000 acre-feet of water to divide, and they proposed to divide it, as I have said, 4,200,000 acre-feet to California, 3,000,000 acre-feet to Arizona, and 300,000 acre-feet to Nevada.

California said, 'We can not possibly do with that amount of water; we must have 4,600,000 acre-feet instead of 4,200,000 acre-feet.' Arizona would not yield more. Then, we came back here, and while no agreement was reached and never has been, and there is no provision in the bill with regard to the division of water, in a meeting that was held in my office between friendly representatives of California and friendly representatives of Arizona and the Nevada delegation it was discovered that there was another paragraph of Article III, which is (b) which reads as follows:

(b) In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum.

In other words, we discovered that there were 1,000,000 acre-feet of water more to divide than we had discussed at Denver. Then we said, 'Divide that 1,000,000 acre-feet between California and Arizona.' What is the result? California will get 4,700,000 acre-feet which is 100,000 acre-feet more than she finally insisted on at Denver; Arizona will get 500,000 acre-feet more than she insisted on, and Nevada would get exactly the same as originally planned. So there is plenty of water there.

[15]

While that tentative agreement was reached, between certain representatives of the three states after the bill was reported out of the Senate, because this extra million feet was not discovered until after the bill had been reported, for one reason and another, we have the deadlock which we find here. I am not here for the purpose of criticizing anyone as to why this deadlock exists, but it does exist, and it may continue notwithstanding how close we are to reaching a compromise. Therefore, we should pass this joint resolution as a safety measure.

I wish to place in the RECORD at this point a suggested amendment. It is not to be proposed, because that would be perfectly useless, but it has been suggested. It is in accordance with the conference to which I have just referred and it is designed to carry out that idea at some date. It was largely drawn by Mr. Wilson, the commissioner of New Mexico, in the course of the conference to which I have just referred. It is only to be published in the RECORD; it is not offered as an amendment.

The Presiding Officer. Without objection, the suggested amendment will be printed in the RECORD.

The suggested amendment is as follows:

Strike out all of lines 1 to 18, both inclusive, and insert in lieu thereof the following:

'SEC. 4(a) This act shall not take effect and no authority shall be exercised hereunder, unless and until the States of Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming shall have ratified the Colorado River compact mentioned in section 12 hereof, and the President, by public proclamation, shall have so declared: *Provided,* That the ratification act of the State of California shall contain a provision agreeing that the aggregate annual consumptive use by that State of waters of the

Colorado River shall never exceed 4,200,000 acre-feet of the water apportioned to the lower basin by paragraph (a) of Article III of said compact, and that the aggregate beneficial consumptive use by that State of waters of the Colorado River shall never exceed 500,000 acre-feet of the water apportioned by the compact to the lower basin by paragraph (b) of said Article III; and that the use by California of the excess or surplus waters unapportioned by the Colorado River compact shall never exceed annually one-half of such excess or surplus waters; and that the limitations so accepted by California shall be irrevocable and unconditional, unless modified by the agreement described in the following paragraph, nor shall said limitations apply to water diverted by or for the benefit of the Yuma reclamation project for domestic, agricultural, or power purposes except to the portion thereof consumptively used in California for domestic and agricultural purposes.

[16]

'The said ratifying act shall further provide that if by tri-State agreement hereafter entered into by the States of California, Nevada and Arizona the foregoing limitations are accepted and approved as fixing the apportionment of water to California, then California shall and will therein agree (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 3,000,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) of the 1,000,000 acre-feet in addition which the lower basin has the right to use annually by paragraph (b) of said article there shall be apportioned to the State of Arizona 500,000 acre-feet for beneficial consumptive use, and (3) that the State of Arizona may annually use one-half of the excess or surplus waters unappor-

tioned by the Colorado River compact, and (4) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (5) that the waters of the Gila River and its tributaries shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico; but if, as provided in paragraph (c) of Article III of the Colorado River Compact, it shall become necessary to supply water to the United States of Mexico from waters apportioned by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply one-half of any deficiency which must be supplied to Mexico by the lower basin, and (6) that the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water which can not reasonably be applied to domestic and agricultural uses, and (7) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact.' "

When the Senate reconvened in the 2nd Session of the 70th Congress on December 5, 1928, the first order of unfinished business was S. 728. Since the House had already passed H. R. 5773, Senator Johnson asked unanimous consent to substitute H. R. 5773 for S. 728 (70 Cong Rec. 67). There was no objection and the substitution was ordered (70 Cong. Rec. 68). Senator Johnson then asked unanimous consent to strike out all after the enacting clause of H. R. 5773 and in lieu thereof to insert all after the enacting clause of S. 728 as reported out of committee. This was granted (70 Cong. Rec. 68).

[17]

On December 6, 1928, Senator Hayden made the following comment (70 Cong. Rec. 161):

> "Mr. Hayden. Mr. President, yesterday, just prior to the adjournment of the Senate, I offered an amendment to the Senate bill that has been offered as a substitute for House bill 5773, which relates to an apportionment of the waters of the Colorado River to the lower basin of that stream. The amendment was taken from the Congressional Record of May 28, 1928. On that date the senior Senator from Nevada (Mr. Pittman) asked to have the amendment printed in the Congressional Record, for the information of the Senate."

He then offered the amendment in the following language (70 Cong. Rec. 162):

> "SEC. 4(a). This act shall not take effect and no authority shall be exercised hereunder, unless and until the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact mentioned in section 12 hereof, and the President, by public proclamation, shall have so declared: Provided, That the ratification act of the State of California shall contain a provision agreeing that the aggregate annual consumptive use by that State of waters of the Colorado River shall never exceed 4,200,000 acre-feet of the water apportioned to the lower basin by paragraph (a) of Article III of said compact, and that the aggregate beneficial consumptive use by that State of waters of the Colorado River shall never exceed 500,000 acre-feet of the water apportioned by the compact to the lower basin by paragraph (b) of said Article III; and that the use by California of the excess or surplus waters unapportioned by the Colorado River compact shall never exceed annually one-half of such excess or sur-

plus waters; and that the limitations so accepted by California shall be irrevocable and unconditional, unless modified by the agreement described in the following paragraph, nor shall said limitations apply to water diverted by or for the benefit of the Yuma reclamation project for domestic, agricultural, or power purposes except to the portion thereof consumptively used in California for domestic and agricultural purposes.

The said ratifying act shall further provide that if by tri-State agreement hereafter entered into by the States of California, Nevada, and Arizona the foregoing limitations are accepted and approved as fixing the apportionment of water to California, then California shall and will therein agree (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 3,000,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) of the 1,000,000 acre-feet in addition which the lower basin has the right to use annually by paragraph (b) of said article, there shall be apportioned to the State of Arizona 500,000

[18]

acre-feet for beneficial consumptive use, and (3) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (4) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (5) that the waters of the Gila River and its tributaries shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico, but if, as provided in paragraph (c) of Article III of the Colorado River compact, it shall become necessary to supply water to the United States

of Mexico from waters apportioned by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply one-half of any deficiency which must be supplied to Mexico by the lower basin, and (6) that the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water which can not reasonably be applied to domestic and agricultural uses, and (7) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact."

Following this was a lengthy discussion of the proposal, during which Senator Hayden commented at 70 Cong. Rec. 163:

". . . The State of Arizona is, therefore, interested in an apportionment of the waters of the lower basin. That is what the amendment which I have offered proposes to do."

Senator King, in regard to the California demand for 4,600,000 acre-feet and Arizona's desire to limit California to 4,200,000 acre-feet a year, commented (70 Cong. Rec. 164):

"There is a difference now of 400,000 acre-feet between the two States. I do not pretend to determine which of the two States is right in this controversy, although I will say frankly to my friend from California that my sympathies have been with Arizona in some phases of the issues between the two States. I have felt that California has been rather too exacting, and that the rights of Arizona under the Constitution have not been fully recognized. In view of the fact that California furnishes no part of the water, that the dam site is in Nevada and Arizona, it has seemed to me that California ought to modify the demands

which she has made. If there are only 400,000 acre-feet dividing the two States, I suggest to the Senator that earnest efforts in the most conciliatory and Christian-like spirit should be made between the representatives of the two States to reach some common ground so that the compact may be ratified.

[19]

I make no comment at this time—I may later on—in regard to the scheme which has been proposed in the pending bill, but I do make an earnest appeal to my friends from Arizona and California to reach an agreement upon all controversial matters."

Senator Bratton of New Mexico again pointed up the fact that only 400,000 acre feet were separating Arizona and California (70 Cong. Rec. 165):

"The Senator from Arizona now is proposing an amendment to this legislation looking to an adjustment of the differences between Arizona and California. As I understand the purport of the amendment, it is to provide that in the act of ratification the State of California shall obligate herself not to claim more than 4,200,000 acre-feet annually of the apportioned water, and no more than 500,000 acre-feet annually of the unallocated or unapportioned water.

Mr. Hayden. No; the Senator has not had an opportunity, perhaps, to read the amendment carefully.

Mr. Bratton. I have not read it carefully, and I shall appreciate it if the Senator will correct me.

Mr. Hayden. The provision in the amendment is that the State of California shall agree not to use more than 4,200,000 acre-feet of the water apportioned in perpetuity to the lower basin, and not more than 500,000 acre-feet of the additional 1,000,000 acre-feet which the compact authorizes to be appropriated in the lower basin.

Mr. Bratton. That is the thought I had in mind, although I did not express it accurately.

If the State of California is willing thus to bind herself, is it the opinion of the Senator from Arizona that that will result in composing the differences among the lower-basin States, and will bring about a 7-State ratification?

Mr. Hayden. Certainly. That is exactly what we are trying to do.

Mr. Bratton. I understand that. The Senator believes that the adoption of this amendment probably will lead to an early ratification by all seven States?

Mr. Hayden. I certainly do, or I would not offer it.

Mr. Bratton. I appreciate that. I should like very much to know if the proposition is entertainable by the State of California.

[20]

Mr. Johnson. No; the amount is not one that it is possible to accept. I am very glad to use it as a basis for an endeavor to reach some conclusion, to do everything that lies within my power to the end that that conclusion will lead either to the ratification of the 7-State pact or to the passage of this bill; but I did not understand the Senator from Arizona in his speech of yesterday to say that a division of water alone would lead to a composition of the differences which exist. I understood him yesterday to insist not alone upon a division of water, as he suggests now, but, as well, to rest upon a substantial prohibition in this bill of the erection by the United States Government of a generating plant at Boulder Dam. Is not that what was said yesterday by the Senator from Arizona?

Mr. Hayden. The Senator from Arizona stated yesterday that there were three essentials to a complete settlement of this controversy: First, the insistence of the States of the upper basin on a 7-State ratification of the Colorado River compact; second, subordinate to that, an apportionment of the waters of the lower basin,

as authorized by the compact; and, third, a provision in this bill which will carry out the recommendations made in the President's message with respect to power.

Mr. Johnson. But the Senator stated yesterday distinctly what he desired, and that was that only private enterprise could erect a generating plant at the Boulder Dam; and he stated the reason. He said that his State desired to charge a taxable amount for the property thus created by private enterprise. Is not that correct?

Mr. Hayden. I interpreted the President's message to mean that the legislation enacted would provide for private development of power at Boulder Dam.

Mr. Johnson. Correct.

Mr. Hayden. In that event everything that Arizona has ever asked for would be accomplished.

Mr. Johnson. All right. Let me say, then, to the Senator from New Mexico, that there are two conditions annexed here: First, Arizona says, 'You must divide the water in accordance with what has been suggested.' Secondly, 'You must forbid the great Government of the United States from erecting, if it desires in the future, a generating plant at Boulder Dam.'

Mr. Bratton. Mr. President, will the Senator from Arizona yield?

The Presiding Officer. Does the Senator from Arizona further yield to the Senator from New Mexico?

Mr. Hayden. I do.

[21]

Mr. Bratton. Let us separate the two things for the moment and discuss only the division of water.

The Senator from Arizona now says that, in his opinion, a restriction to 4,200,000 acre-feet will bring about a ratification of the compact by all seven States, including Arizona. I understand the Senator from California to say that the amount thus designated is not altogether satisfactory.

Mr. Johnson. The Senator is quite right. That is correct, sir.

Mr. Bratton. Is the Senator in position to say what is entertainable?

Mr. Johnson. The lowest amount conceivable from the standpoint of the information now at hand with me is 4,600,000 to be put in as an amendment to this bill by the Senator from Wyoming; but what I was calling to the attention of the Senator was this:

Of what avail is it to say, 'You ought to make sacrifices of water and water rights that are now perfected'; of what avail is it to say to California, 'You must yield that which you practically have today, and that is absolutely necessary to the welfare of your people, to have a composition,' when the second condition is annexed that 'You, too, must say that your Government never shall be permitted to erect a generating plant at the Boulder Dam'?

Mr. Bratton. But if we pass the bill in the alternative condition in which it now stands that will govern; will it not?

Mr. Johnson. But you have not reached a composition between Arizona and California, then. That is the difficulty.

I will say to the Senator from New Mexico that in my opinion I could sit down with him, and possibly with the Senator from Arizona—because our relations are most friendly—and we might reach an agreement as to water. I am not clear as to that; I would be glad to; but I can not, sir, reach an agreement as to water that shall be a composition of the differences existing and pledge myself that the Congress of the United States will enact a law that a generating plant never can be erected by the United States Government.

Mr. Bratton. Discussing the subject of water separate and apart from all other features of the bill, there seems to be a difference of 400,000 acre-feet between Arizona and California.

Mr. Johnson. So there seems.

Mr. Bratton. Without taking sides either way, we in the upper-basin States desire to adjust the whole matter satisfactorily to all of the States concerned. Any other attitude would be unbecoming a State.

[22]

Mr. Johnson. I am sure that is the attitude of the gentlemen who confront me here.

Mr. Bratton. We entertain the friendliest feeling toward each State; but it does seem to me, representing one of the upper-basin States deeply and vitally concerned in the matter, that when we are dealing with 15,000,000 acre-feet, a difference of 400,000 acre-feet should not be permitted to defeat the entire proposal. I think each side could afford with profit to yield something, and not let a controversy respecting that slight volume of water defeat one of the most important measures that Congress has considered during a long time in the past and perhaps one of the most important that it will consider during a long space of time in the future. I want to join with the Senator from Utah (Mr. King) in saying that it is the earnest desire of the upper-basin States to aid the lower-basin States in adjusting and composing these differences and passing this legislation in a form that will be reasonably satisfactory to the two States and the other five as well.

Mr. Johnson. I am sure that is so.

Mr. Bratton. I want to urge that this difference of 400,000 acre-feet be not allowed to stand as a barrier to the passage of this legislation. There are no two men in the Senate more willing or disposed to discuss a thing dispassionately and progressively and constructively than the Senator from California and the Senator from Arizona."

During this debate, an important exchange was commenced at 70 Cong. Rec. 167 by Senator Hayden:

"I want the Senate to understand why it was that Arizona did not approve the compact. The reason was perfectly simple. The Legislature of Arizona, after the most careful consideration, arrived at the conclusion that it was unsafe for the State of Arizona to approve that agreement unless there should be an understanding as to how the waters of the lower basin should be apportioned between the States of Arizona and California. They found on record filings by the State of California which claimed all of the water of the Colorado River.

Mr. Johnson. Mr. President, will the Senator yield?

Mr. Hayden. I yield.

Mr. Johnson. Can the Senator state how much of perfected water rights there are in the State of California to-day from the Colorado?

Mr. Hayden. The best way I can answer the Senator from California is to read to him from a proposal made by the commissioners representing the State of California on the 1st day of December, 1925, wherein those commissioners suggested an allocation of water:

> That there is hereby allocated from the waters of the Colorado River in the State of California in present perfected rights,

[23]

> in addition to all other allocations of beneficial consumptive use, 2,146,600 acre-feet of water.

In other words, in the year 1925 the State of California claimed to have perfected a right to the use of 2,146,600 acre-feet of water.

Mr. Bratton. Mr. President, will the Senator yield?

Mr. Hayden. I yield.

Mr. Bratton. Can the Senator tell us what the present perfected rights in Arizona amount to?

Mr. Hayden. I cannot; I have not that information at hand.

Mr. Johnson. Let me call the attention of Senators to the fact in that connection, too, that the amounts

that are now actually appropriated, and that are being applied to use, or are in process of being put to use, in either of which events the appropriation is perfectly good and the water cannot be taken away, are 4,508,708 acre-feet.

Mr. Hayden. Does the Senator include in that amount an appropriation filed by the city of Los Angeles for water for domestic use?

Mr. Johnson. Yes; it is a perfectly good filing and a legal filing. It has its standing to-day.

Mr. Hayden. I will say to the Senator very frankly and in the best of spirit that that filing, without the passage of legislation by Congress, without the construction pursuant to that legislation of a dam to impound the water of the Colorado River, will produce no more water for the city of Los Angeles than was contained in the ink used by the person who signed the document in behalf of that city.

Mr. Johnson. Let us even concede that——

Mr. Hayden. As a practical matter, the filing is utterly worthless unless the Congress of the United States appropriates money to build the Boulder Dam.

Mr. Bratton. How much is involved in that filing?

Mr. Johnson. One million and ninety-five thousand acre-feet.

Mr. Bratton. How far has that filing progressed?

Mr. Johnson. It has progressed to the extent that every legal formality has been complied with and over $1,000,000 have been expended already by the city of Los Angeles in respect to it.

In addition to that, I want to make clear—although I ought not to interrupt the Senator from Arizona, and I will conclude with just this statement—in addition to that there are rights to which appropriation rights have not yet attached, but which, under the known feasibility,

[24]

with the all-American canal, will be equal to not less than 338,800 acre-feet, making a total of 5,264,300 acre-

feet. I am giving these figures because I am going to compare them ultimately, and ask the Senator from Arizona to compare them, first, with the number of acre-feet which thus far have been appropriated by Arizona and the number possible to be used by Arizona under the construction that is contemplated by this bill; and I want those figures to be borne in mind by Senators when they consider water and water rights.

Mr. Walsh of Montana. Mr. President, will the Senator yield?

Mr. Hayden. I yield.

Mr. Walsh of Montana. I would like to inquire of the Senator from California what is the character of the diversion contemplated in the Los Angeles appropriation?

Mr. Johnson. The character is a pumping from the river over 1,400 feet of hills into an aqueduct.

Mr. Walsh of Montana. Does it contemplate any dam or any storage at all?

Mr. Johnson. No; not that I am aware of. I think no dam is contemplated there.

Mr. Walsh of Montana. Is any such amount of water available from the natural flow of water without storage?

Mr. Johnson. I do not think that amount of water is available at all at the present moment.

Mr. Walsh of Montana. I would think that the appropriation, to be of any value, must contemplate works making it feasible.

Mr. Johnson. Those works thus far have been commenced in the expenditure of a million dollars in surveys and the like, and somebody sometime—the city of Los Angeles or the Government or somebody—will unquestionably construct a dam.

Mr. Walsh of Montana. That is what I wanted to know. The dam would be constructed somewhere in the State of Nevada or Arizona?

Mr. Johnson. I presume that is likely, although this diversion is from Arizona.

Mr. Walsh of Montana. Would the city of Los Angeles be authorized, without specific authority from Congress, to throw a dam across the Colorado River in Arizona?

Mr. Johnson. I think not. My offhand 'shotgun' opinion would be no.

Mr. Walsh of Montana. Then, it seems to me there is some question about it.

[25]

Mr. Johnson. There is one aspect in which it might be done, and that is by the Federal Power Commission. It strikes me that under the Federal water power act the privilege could be accorded to the city of Los Angeles to erect a dam.

Mr. Walsh of Montana. Would not the appropriation be nugatory in the absence of that authority in view of the existing statute under which the water power commission is without power?

Mr. Johnson. I would change the adjective. I would not say 'nugatory.' I would say 'futile.'

Mr. Walsh of Montana. Suspended?

Mr. Johnson. Suspended is a better word still.

Mr. King. Mr. President, will the Senator from Arizona suffer an interruption?

Mr. Hayden. I yield to the Senator from Utah.

Mr. King. As I understood the Senator in reading from the document a few moments ago, it showed that there is a claim of 2,000,000 acre-feet plus of perpetual water right in California.

Mr. Hayden. That is right.

Mr. King. I would like to know if the document states just what was done to perfect those rights and whether there was any water used under those rights other than in the Imperial Valley?

Mr. Hayden. I have here a proposal made in 1925 by the commissioners appointed by the State of California to the State of Arizona for an apportionment of the water of the lower basin. The best way to

answer the Senator from Utah is to read just what the proposal says:

> ART. 3. The States of California and Nevada hereby release to the State of Arizona any and all claims of every kind and nature to the use of the waters of the Gila River, the Williams River, and the Little Colorado River and all of their respective tributaries for agricultural and domestic use, and the States of Arizona and California hereby release to the State of Nevada any and all claims of every kind or nature to the use of the waters of the Virgin River and all of its tributaries for agricultural and domestic use, in consideration of which there is hereby allocated from the waters of the Colorado River to the State of California 1,095,000 acre-feet of water per annum in perpetuity for beneficial consumptive use.

It will be observed that at that time the State of California asked the States of Arizona and Nevada to allocate for the use of that State 1,095,000 feet of water upon condition that California would waive any claim that it might have to the waters of the tributaries of the Colorado River in Arizona and Nevada. At that time apparently the

[26]

State of California had not made any filing, had not posted a notice on a stone or post somewhere near the Colorado River, had not filed a document in some public office, asserting an appropriation of water for domestic use by the municipalities of southern California.

I take it from the similarity of the figures, 1,095,000 acre-feet, that they represent an equal quantity of water desired by the cities of southern California, as was just expressed by the Senator from California. At that time California was seeking to obtain water for domestic purposes; and it was indeed very kind and very generous of the California commissioners to say that they would waive any and all claims to the waters of the

tributaries of the Colorado River in Arizona and Nevada in consideration of California being allowed to have that amount of water. They were willing to give Arizona and Nevada what the two States already possessed in order to obtain the use of 1,095,000 acre-feet of the water for domestic purposes.

Mr. Walsh of Montana. Mr. President, if the Senator will pardon me, I would like to pursue a little further the colloquy I had with the Senator from California.

Mr. Hayden. I yield to the Senator from Montana for that purpose.

Mr. Walsh of Montana. If the city of Los Angeles has this enormous appropriation of the waters of the Colorado River, a perfected appropriation or an inchoate appropriation, does it follow, if the Government erects this dam across the Colorado River and creates a great storage basin, that it must yield up that amount of water to the city of Los Angeles?

Mr. Johnson. I rather think so, just exactly as if it were a perfected right for irrigation purposes.

Mr. Walsh of Montana. Yes; but I always understood that the interest that stores the water has a right superior to prior appropriations that do not store.

Mr. Johnson. Possibly so. What is the point?

Mr. Walsh of Montana. The point is that apparently, if that is correct, then this expenditure is being made with no right in the Government of the United States to control the water which is stored, but that it must go to those appropriators.

Mr. Johnson. No; the bill provides that a contract in advance must be made for the storage of water by the Secretary of the Interior.

Mr. Walsh of Montana. A contract with whom?

Mr. Johnson. With those who utilize and take and appropriate the water.

Mr. Walsh of Montana. That is to say, the Government may dispose of the stored water as it sees fit?

Mr. Johnson. Yes; under the terms of this bill.

Mr. Walsh of Montana. Then how can it be said that the city of Los Angeles has a perfected interest?

Mr. Johnson. It has a perfected right there unquestionably, but the bill requires the city of Los Angeles to conform to it, and the city of Los Angeles is perfectly willing to conform to it just exactly as if it had no perfected right.

Mr. Walsh of Montana. Am I correct in the assumption that the Government of the United States must distribute the water to the various appropriators in accordance with their several appropriations?

Mr. Johnson. If they contract.

Mr. Walsh of Montana. Yes; but to contract means a liberty of contract. That is what I want to know. Can the Secretary give the water to them or withhold it from them as he sees fit?

Mr. Johnson. Certainly, because before he begins work upon the dam he has to have the contract in his possession for its payment, and he is the one who is to fix the sums that are to be paid.

Mr. Walsh of Montana. Yes, but that is quite contradictory. It seems to me that the city of Los Angeles has no rights by virtue of this appropriation.

Mr. Johnson. Certainly it has, but those rights unquestionably will be controlled by this bill.

Mr. Walsh of Montana. I should like to have a very much clearer understanding about that than I have.

Mr. Johnson. I fear I cannot make it any clearer to the Senator. I would like to do so if I were able.

Mr. Walsh of Montana. Let me inquire of the Senator, then, of what value to the city of Los Angeles is this appropriation? It goes to the Secretary of the Interior to furnish water pursuant to its appropriation. The Secretary of the Interior says, 'I do not accept your terms at all. I will not contract with you upon

that basis.' Someone else comes along who offers to make a contract with the Secretary of the Interior for the water, that is satisfactory to him and to them. Where, then, does the city of Los Angeles come out?

Mr. Johnson. I doubt very much if the Secretary, under the circumstances, would make such a contract.

Mr. Walsh of Montana. Then he is obliged to contract with the city of Los Angeles?

Mr. Johnson. No; he is not obliged to do so, but he is obliged to contract with somebody that makes the same claims to the same waters,

[28]

and unless the contract is by mutuality agreed upon then he will not build the dam. That is the condition precedent to the construction of the dam.

Mr. Walsh of Montana. Then he is at liberty to contract with the city of Los Angeles, which has an appropriation, or with someone else that has not an appropriation?

Mr. Johnson. Yes; he is at liberty to contract with the city of Los Angeles, which has an appropriation.

Mr. Walsh of Montana. But can he disregard the city of Los Angeles?

Mr. Johnson. I doubt very much if he can.

Mr. Walsh of Montana. And contract with someone else who has no appropriation?

Mr. Johnson. I doubt very much, first, if he would, and I doubt secondly, if he could.

Mr. Hayden. Mr. President, if the Senator from Montana will permit me, I want to assure him that so far as these paper appropriations of water are concerned there are just as many of them on the Arizona side of the river as there are on the California side.

Mr. Walsh of Montana. I rather assumed so.

Mr. Hayden. I am quite sure one paper appropriation of water is just as valuable as another. I do know that the Arizona High Line Canal Association has filed an application for all of the water of the Colorado

River in due and legal form in the State of Arizona. If that is of real and substantial value, then Arizona has good title to all the water in the Colorado River.

Mr. Walsh of Montana. I directed the inquiry merely for the purpose of trying to find out, if I can, under what kind of obligation the Government of the United States, should it build this dam, would be to those who have the appropriations.

Mr. Johnson. The Government would be under no obligations until it makes its terms. I seem unable to make that plain. But here is everything in this scheme, plan, or design: Everything is dependent upon the Secretary of the Interior contracting with those who desire to obtain the benefit of the construction, and he is not to undertake any expenditure nor to undertake any construction until that shall have been accomplished.

Mr. Walsh of Montana. Let us suppose the Arizona people are perfectly willing to meet the requirements and that the Los Angeles people are perfectly willing to meet the requirements, and other people who have not even attempted to make any appropriation are perfectly able and willing to meet the requirements. Who then has the right?

[29]

Mr. Johnson. The Secretary of the Interior and the Government have the right.

Mr. Walsh of Montana. The Secretary of the Interior may utterly ignore those appropriations?

Mr. Johnson. Possibly so.

Mr. Walsh of Montana. That is what I am curious to find out about.

Mr. King. Mr. President, will the Senator yield?

Mr. Hayden. I yield.

Mr. King. It occurs to me that the Secretary of the Interior would be derelict in his duty, if this bill were to become a law, if he should spend one penny in the construction of a dam until he had determined the

different rights existing either in California or in Arizona with respect to the waters of the river. If there are suspended or inchoate rights in either of those States which might not ripen into perfected rights through a contract or recognition of the same, and there is sufficient water to meet all of those suspended or inchoate or perfected rights, it will be the duty of the Secretary of the Interior, if he were fully to discharge his duty, to obtain from those claimants a waiver of their rights, inchoate or perfected. If not, when the dam was constructed and the water impounded the Government of the United States might have a dozen law suits; persons who had made filings might insist that the water impounded was theirs; that they had been interfered with by a superior physical power, to wit, the Government of the United States, and that they had been prevented from completing rights which they had initiated either under State laws or by reason of acts of Congress. It is obvious that there are claims here for a vast amount more water than flows in the Colorado River.

Mr. Hayden. Mr. President, if the Senator will permit me, I should like to say that that is not an unusual situation. On every stream throughout the entire western part of the United States where irrigation is practiced appropriations have been filed for many times more water than flows in the streams. There is nothing to prevent any qualified citizen of the United States or any corporation organized under the laws of any State from posting a notice, upon a rock, or tacking it to a monument on the bank of the river or going to some county recorder's office and making a filing, claiming a vast quantity of water out of the stream. That condition exists everywhere and it does not alarm anyone. Appropriations of that kind have been made in California, and have been made in Arizona, and none of them are of any value whatsoever so far as the future is concerned until the Government of the United States spends some sixty or seventy

million dollars to build a dam and impound the waters of the Colorado River and make the same actually available for diversion and use.

Mr. King. Mr. President, if the Senator will pardon me, I think that the last statement made by him is a little too broad. The

[30]

Senator in the plenitude of his experience in the Western States knows that sometimes a right is initiated by the weaker party, if I may use that expression, and a superior party, sometimes by physical force, comes in and builds a dam sooner than the other man. I have known them to be driven from the construction by guns. It is obvious that the man who has been driven off or been prevented from completing his rights would have some standing in a court of equity if he were to attack the rights or the claimed rights of the superior party who had perhaps control of the dam and had taken the water out of the stream.

It seems to me that the statement made by the Senator should admonish us that if this bill is to be passed there should be a provision in it that there shall be no work done under the law until the conflicting rights, if there be any, shall be determined, and, if necessary, that a bill in equity be filed against all persons who claim water in the stream, in order that the rights may be adjudicated and waivers obtained.

Mr. Hayden. Let me say to the Senator from Utah that I do not concede that any such provision is at all necessary. The only thing required in this bill is contained in the amendment that I have offered, that there shall be apportioned to each State its share of the water. Then, who shall obtain that water in relative order of priority may be determined by the State courts.

Mr. King. If the Senator means by his statement that the Federal Government may go into a stream, whether it be the Colorado River, the Sacramento River, or a river in the State of Montana, and put its powerful

hands down upon the stream and say, 'This is mine; I can build a dam there and allocate water to whom I please, regardless of other rights, either suspended, inchoate, or perfected,' I deny the position which the Senator takes.

Mr. Hayden. The amendment that I have offered contemplates no such possibility.

Mr. Walsh of Montana. Mr. President, let me remark——

Mr. Phipps. Mr. President, will the Senator from Arizona yield to me?

The Presiding Officer. Does the Senator from Arizona yield; and if so, to whom?

Mr. Hayden. I yield first to the Senator from Montana.

Mr. Walsh of Montana. Let me remark in that connection that if, as contended apparently by the Senator from California, the city of Los Angeles has a right, inchoate in character, in process of perfection, which entitles it to a certain amount of water out of the Colorado River, if we allocate so much of the water to the State of Arizona as interferes with its rights, would not we be taking property from the people of Los Angeles without due process of law?

Mr. Hayden. If the right were of a character that must be recognized, I would agree with the Senator.

[31]

Mr. Walsh of Montana. That, I understand, is the contention of the Senator from California, that the hands of the Government are tied; that if we shall erect a dam there at all we shall have to give enough water out of that dam to the city of Los Angeles to satisfy its appropriation.

Mr. Hayden. But I am quite sure, if I understood correctly the Senator from California, that he qualified that statement by saying that, after all, the Secretary of the Interior could allow the city of Los Angeles to

have such quantity of water as might be determined by contract."

Senator Hayden also commented at 70 Cong. Rec 171:

"Mr. Hayden. I really cannot tell the Senator, because I have at hand no accurate figures on the total quantity of water in the Arizona tributaries.

Since that subject has been mentioned, let me say to the Senate that in the case of a river—for example, the Gila River—wholly within the State of Arizona, whose waters are used in the very heart of the State, if those waters were released from a reservoir when needed at a time of drought they must flow down a wide, sandy river bed for some 200 miles before they could reach any other State. It is perfectly obvious that under those conditions the water never would arrive. It would simply be lost by evaporation. Therefore we say that the physical situation is such that it is utterly impossible for any water out of the Gila River or its tributaries to be delivered to any other State or to Mexico during a time of drought, when water is needed; and that is the only time when Arizona would be called upon for a delivery of water. Therefore the physical facts are such that it is utterly impossible, even though some State had a right to acquire the use of water from that stream, for any other State to obtain any of the water. Therefore no State other than Arizona has any interest in the waters of the Gila River. That would be equally true of a tributary such as the Bill Williams, which in time of drought goes down to a mere trickle; or of the Little Colorado River, a tributary in northern Arizona which likewise goes dry in places during a period of drought. There is no water in the tributaries of the Colorado River in the State of Arizona that could be of any possible benefit to any other State in time of drought. If reservoirs existed on these tributaries, and any other State had a right to come into the State of Arizona and insist that the reservoir be opened and the water turned down its natural course to flow into some

other State, not a drop of water would arrive during the dry period. Therefore we have felt, naturally, that no other State had any interest in those tributary streams, and particularly so in the case of the Gila River, which empties into the Colorado River below the Laguna Dam.

Under the terms of this bill under the plan of the United States Reclamation Service the last and lowest point on the Colorado River where any water will be diverted from that stream is at Laguna Dam, and Laguna Dam is some 10 or 12 miles above the mouth of the Gila River.

[32]

It is true that at the present moment water is diverted from the Colorado River into the State of California just a short distance above the international boundary line at what is known as Hanlon Heading. It is possible for waters which come down the Gila River in time of flood to flow from that stream into the Colorado and then a short distance down the Colorado and into Hanlon Heading and over into Imperial Valley. But the diversion at Hanlon Heading, which is in existence at the present moment, is to be superseded by a transfer of the heading up the stream to Laguna Dam. The Imperial irrigation district is under contract with the Secretary of the Interior to move its heading to Laguna Dam and is now paying annually on that contract. The privilege that they can have of diverting water at Hanlon Heading is only temporary. There is in existence a restraining order of the courts to prevent a diversion there, and each year the court requires the posting of a bond that if any damage results to the United States reclamation project at Yuma by reason of the placing of a weir to divert water from the Colorado River into Hanlon Heading the United States will be made safe from all such damage. Everyone knows that under the terms

of the Swing-Johnson bill California never can obtain a drop of water out of the Gila River.

Mr. King. Mr. President, will the Senator permit an inquiry?

Mr. Hayden. Certainly.

Mr. King. Have the owners of the waters in Imperial Valley, or the irrigation district, at any time ever claimed the Gila River or any part of its waters as necessary for the irrigation of Imperial Valley, or as a proper tributary to their stream?

Mr. Hayden. Whether they have claimed it or not, there is no question but that they have used the waters of the Gila River when that stream happened to be flowing into the Colorado. But, as I stated to the Senator a moment ago, there are long periods in almost every year when, for more than a hundred miles from its mouth, the Gila River is absolutely dry. The Gila River, in truth and in fact, has been more of a menace to the Imperial Valley than a benefit. The people of the Imperial Valley would much prefer to move their point of diversion up the stream to Laguna Dam, and then obtain water from the Boulder Canyon Reservoir, than to depend upon any rights they may have to the waters of the Gila River, because the supply is so unstable as to be practically valueless to them.

Mr. King. I have understood from the records, and from my observation, that the Gila River is what some denominate as a 'flash' stream; that when they amounted to anything, and might be of any value for irrigation purposes in the Imperial Valley, the waters in the Gila came down at a time when there was ample water flowing down the Colorado River from above to answer all the demands of the Imperial Valley, and therefore the Imperial Valley had never used the waters of the Gila River.

I do not mean by that to say that the waters of the Gila River did not commingle with the waters of the Colorado River, and at a time when there was water being taken out of the Colorado River at that

point for the Imperial Valley, but my understanding is that whenever there was water flowing from the Gila River into the Colorado River, at that time there was more than sufficient water flowing down the Colorado River to answer all the demands of the Imperial Valley.

Mr. Hayden. The flow of the Gila is so spasmodic and so irregular that no rule can be laid down as to when a flood may be expected. A study of the records will show that during some months each year the river has been dry, and in other years during some months water has flowed from the Gila River into the Colorado. But, in truth and fact, from the best information I have from residents of the Imperial Valley, they have not depended upon the Gila River for any part of their water supply. When the Gila River is in flood it carries large quantities of silt, and they would much prefer, for that reason, if for no other, to move the point of diversion up the Colorado River to Laguna Dam."

In discussing the 1925 California proposal and the 1927 Governors' Conference proposal, Senator Hayden commented (70 Cong. Rec. 171):

"These two documents express the demands of Arizona and California, made prior to the Denver conference. When the Denver conference was held, the governors of the four upper-basin States asked each State to indicate just how much water they wanted out of the Colorado River. The State of Nevada again asked for 300,000 acre-feet out of the seven and a half million acre-feet apportioned in perpetuity to the lower basin.

The State of Arizona again agreed that Nevada should have that quantity of water, and asked for one-half of the water in the Colorado River.

The State of California submitted a demand for 4,600,000 acre-feet of water. How they arrived at

that figure I do not know. It may have been based, first, upon present perfected rights, as they asserted, of 2,146,600 acre-feet, plus 1,095,000 acre-feet desired by the municipalities of southern California. But those two figures do not equal 4,600,000 acre-feet of water. Adding the amount of water asserted by California on December 1, 1925, to be a perfected right which is 2,146,000 acre-feet, to 1,095,000 acre-feet, which they did not at that time assert to be such a right, but as a mere desire on the part of the municipalities of southern California to obtain that amount, the two combined amount to 3,241,000 acre-feet. But in Denver, California asked for 4,600,000 acre-feet of water.

The governors of the four upper-basin States, having carefully considered the proposals made by the three States of the lower basin, made the following finding:

> The governors of the States of the upper division of the Colorado River system suggest the following as a fair apportionment of water between the States

[34]

> of the lower division, subject and subordinate to the provisions of the Colorado River compact:
>
> 1. Of the average annual delivery of water to be provided by the States of the upper division at Lees Ferry under the terms of the Colorado River compact:
>
> (a) To the State of Nevada, 300,000 acre-feet.
>
> (b) To the State of Arizona, 3,000,000 acre-feet.
>
> (c) To the State of California, 4,200,000 acre-feet.

The governors have not explained in any printed document, so far as I know, how they arrived at this compromise. I was told that it was based upon the following facts: They endeavored, by questioning the California representatives at that conference, to ascer-

tain not only what California claimed but the quantity of water to which California had actually perfected rights to use, based upon the normal flow of the Colorado River, unregulated by any reservoir; and they determined that amount.

They also endeavored to determine how much water was being actually used in the State of Arizona, or how much water the State of Arizona had acquired a perfected right to use, and from the total quantity ascertained to be the amount that California had a right to use; they subtracted the amount that Arizona now has a similar right to use and found the difference to be 600,000 acre-feet of water. So the governors said: 'Perfected rights must be respected. California has a larger perfected right to the use of water than Arizona. Therefore we will deduct from the demand of Arizona for one-half of the total quantity of the water of the stream, 600,000 acre-feet.'

Subtracting 300,000 acre-feet for Nevada from seven and one-half million acre-feet, and then dividing the remainder, would give to Arizona 3,600,000 acre-feet and to California 3,600,000 acre-feet. The governors, after careful consideration, recommended that from Arizona's demand of half the water, or 3,600,000 acre-feet, there be subtracted 600,000 acre-feet, leaving 3,000,000 acre-feet for the State of Arizona. They added to the other half of the water 600,000 acre-feet, increasing California's proportion of the water from 3,600,000 to 4,200,000 acre-feet. That was the recommendation of the governors.

The State of Arizona, through its legally appointed commissioners, consisting of the governor of the State, five members of the legislature of the State, and two other citizens of the State, by a formal vote, accepted the recommendation of the governors of the upper-basin States, and agreed to accept, out of the main Colorado River, 3,000,000 acre-feet.

Mr. Johnson. Is the Senator certain there was no condition attached to that?

[35]

Mr. Hayden. I can read the last expression made by the Arizona-Colorado River Commission.

Mr. Johnson. I am just asking the Senator; is he certain there was no condition attached to it?

Mr. Hayden. There were conditions, yes; but nothing of grave importance. I shall very shortly read the last statement on the subject of water as made by the Arizona commissioners.

The governors at Denver went on further and stated, in addition:

> 2. To Arizona, in addition to water apportioned in subdivision (b), 1,000,000 acre-feet of water to be supplied from the tributaries of the Colorado River flowing in said State, and to be diverted from said tributaries before the same empty into the main stream. Said 1,000,000 acre-feet shall not be subject to diminution by reason of any treaty with the United States of Mexico, except in such proportion as the said 1,000,000 acre-feet shall bear to the entire apportionment in (1) and (2) of 8,500,000 acre-feet.
>
> 3. As to all water of the tributaries of the Colorado River emptying into the river below Lees Ferry not apportioned in paragraph (2) each of the States of the lower basin shall have the exclusive beneficial consumptive use of such tributaries within its boundaries before the same empty into the main stream, provided, the apportionment of the waters of such tributaries situated in more than one State shall be left to adjudication or apportionment between said States in such manner as may be determined upon by the States affected thereby.

That last provision referred particularly to the Virgin River, which was partly in Utah, partly in Arizona, and partly in Nevada, the only important tributary that is a stream of interstate character.

4. The several foregoing apportionments to include all water necessary for the supply of any rights which may now exist, including water for Indian lands in each of said States.

5. Arizona and California each may divert and use one-half of the unapportioned waters of the main Colorado River flowing below Lees Ferry, subject to future equitable apportionment between the said States after the year 1963, and on the specific condition that the use of said waters between the States of the lower basin shall be without prejudice to the rights of the States of the upper basin to further apportionment of water as provided by the Colorado River compact.

[36]

As I said, the State of California refused to accept the Denver apportionment. At the close of the conference the Arizona-Colorado River Commission addressed this statement to the governors of the upper division of the Colorado River Basin:

> The lawful representatives of the State of Arizona, members of the Colorado River Commission of said State, and their advisers, in attendance upon the conference called by you and convened at the City of Denver, Colo., on July 22, 1927, deeply regret that the full purpose of the conference, to bring about an agreement which would result in complete ratification by seven States of the Colorado River compact and solution of the Colorado River problem, has not been effected.
>
> Such agreement not having been reached, we desire at this time to state concretely Arizona's position, as taken by her representatives at this conference and disclosed by the record, in a sincere and earnest effort to accomplish the purposes thereof.

This is the important part of the document with respect to water:

We hold that Arizona possesses the land, the natural facilities, to economically utilize within her borders a very large proportion, if not all, of the waters of the Colorado River system available for irrigational use in the lower basin; that as a matter of justice, right and equity, if the law of prior appropriation is to be superseded by a compact, she is entitled to the undisturbed, undisputed, and unlimited use, to the extent that such use is feasible, of the waters of her tributary streams, just as the State of California is entitled to and has the use of the water of her streams, and that she is equally entitled to at least one-half of the flow of the main stream of the Colorado River available for use in the States of the lower division, after due allowance is made for the practical irrigational requirements of the State of Nevada. Nevertheless, for the purpose of effecting an agreement at this time, and out of consideration for the untiring efforts of the governors of the States of the upper division to bring about such an agreement, and in deference to their judgment as to what under the circumstances would be fair and reasonable, we have accepted, with certain interpretations of language relating to the immunization of Arizona's tributaries against depletion for the benefit of Mexico, the proposal of the governors of the States of the upper division submitted on September 19, 1927, which said proposal, so interpreted, would allocate to the State of California 4,200,000 acre-feet of water per annum; to Arizona, 3,000,000 acre-feet and the right to the use of such of the waters of her tributaries as may be diverted therefrom for beneficial use; and would divide the unallocated flow of the river,

[37]

available for the use of the lower-division States, equally between Arizona and California.

Nothing was accomplished by the Denver conference with respect to a division of water by reason of the fact that California refused to accept the recommendation made by the four governors, and so the matter stood when Congress met.

Mr. Johnson. Mr. President, may I ask the Senator a question?

Mr. Hayden. Certainly.

Mr. Johnson. Does the Senator assert that Arizona accepted the recommendations made by the governors?

Mr. Hayden. I have just read the last word that Arizona said on that subject.

Mr. Johnson. With certain reservations.

Mr. Hayden. Arizona accepted the water proposal of the upper-basin governors with certain reservations, interpretative only with respect to any demand for water that might be made by Mexico. We will not disagree at all that the Arizona acceptance of the proposal was not consummated by a further negotiation and understanding until the minds of the governors and the representatives of all the States actually met and agreed upon the document. If they had done so, the controversy would have been over.

When Congress assembled in December, 1927, no agreement had been made. The senior Senator from Nevada (Mr. Pittman), in continuation of the earnest efforts that he has made all these years to bring about a settlement of the controversy between the States with respect to the Colorado River, invited a number of us to conferences in his office and there we talked over the situation.

It was discovered at that time, as the Senator said, that instead of being able to divide the 7,500,000 acre-feet of water, which was not enough to satisfy the demands of all the States, we could legally, under the terms of the Colorado River compact, divide an additional million acre-feet. Therefore the proposal was made that the recommendation made by the governors of the four upper-basin States be accepted and that

there be added thereto the additional million acre-feet of water apportioned by the compact to the lower basin, and that that quantity of water be divided equally between California and Arizona, which would increase the total apportionment to each State by 500,000 acre-feet. By the new plan the State of California would have 4,700,000 acre-feet of water in the main stream of the Colorado River, or 100,000 acre-feet more than that State asked for at Denver, and the State of Arizona would have 3,500,000 acre-feet, or within 100,000 acre-feet of the quantity she originally asked for at Denver. By such an arrangement it was felt that the rights and the desires of all of the States could be accommodated. That arrangement has been incorporated in the amendment which I have offered to the bill and which is now pending. I would like to discuss that amendment in detail."

[38]

Senator Hayden continued the explanation of his amendment at 70 Cong. Rec. 174:

"Mr. Hayden. The hour is getting late. If I may, I should like to continue the reading of the amendment that I have offered so that I may explain its terms. I have read the proposal now contained in the bill as reported to the Senate and as recommended by the Senate Committee on Irrigation and Reclamation for the purpose of pointing out that the committee placed in the bill the 4,600,000 acre-feet of water, which, as I have said, was the demand made by California; whereas in the amendment that I have offered is 4,200,000 acre-feet of water, which is the quantity recommended for apportionment to California by the governors of the four upper basin States. Thus far the provisions are the same except for the difference of 400,000 acre-feet. To go on with the amendment, which provides further—

and that the aggregate beneficial consumptive use by that State of waters of the Colorado River shall never exceed 500,000 acre-feet of the water apportioned by the compact to the lower basin by paragraph (b) of said Article III—

That refers to the extra million acre-feet apportioned to the lower basin by the Colorado River compact. So that, adding together the 4,200,000 acre-feet apportioned by paragraph (a) of Article III of the Colorado River compact and the 500,000 acre-feet apportioned to the lower basin by paragraph (b) of the same article of the compact the total quantity of water which we ask the State of California to be limited to is 4,700,000 acre-feet out of the main stream of the Colorado River, which is 100,000 acre-feet more than California demanded at Denver.

In addition my amendment provides—

and that the use by California of the excess or surplus waters unapportioned by the Colorado River compact shall never exceed annually one-half of such excess or surplus waters.

A similar provision is found in the committee amendment, and a similar provision is found in the recommendation of the governors, that the excess or surplus water be divided equally between the two States—

and that the limitations so accepted by California shall be irrevocable and unconditional, unless modified by the agreement described i the following paragraph, nor shall said limitations apply to water diverted by or for the benefit of the Yuma reclamation project for domestic, agricultural, or power purposes except to the portion thereof consumptively used in California for domestic and agricultural purposes.

That last phrase appears in the amendment as a sort of supercaution, so to speak. There were those who feared because the water used for irrigation upon the Yuma project in Arizona was first diverted from the Colorado River in California, carried for some distance in that State, and conveyed into Arizona by a siphon which goes under the Colorado River, that unless specific mention was made of the fact, California, because the water was diverted in that State, might be charged with water used in Arizona. Of course, we had no intention of doing anything of that kind and protected that point accordingly.

I have read what California is required to do and how that State is limited. Let me now tell the other side of the story, as it appears in the amendment.

The said ratifying act—

That is, the ratifying act of the Legislature of California—

> shall further provide that if by tri-State agreement hereafter entered into by the States of California, Nevada, and Arizona the foregoing limitations are accepted and approved as fixing the apportionment of water to California, then California shall and will therein agree (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet—

That is, the quantity apportioned to Nevada by the governors' conference at Denver—

> and to the State of Arizona 3,000,000 acre-feet for exclusive beneficial consumptive use in perpetuity—

That likewise agrees with the recommendation made by the governors of the upper basin States—

and (2) of the 1,000,000 acre-feet in addition which the lower basin has the right to use annually by paragraph (b) of said article, there shall be apportioned to the State of Arizona 500,000 acre-feet for beneficial consumptive use—

Again dividing the water equally with California so far as the additional million acre-feet are concerned—

And (3) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (4) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State—

As I have already explained to the Senate, the Gila River empties into the Colorado River below the Laguna Dam. It empties into it at a point where neither the State of California nor any other State can use any of its surplus waters. Therefore we felt justified in asking

[40]

the State of California to exclude from any computation of water the Gila River and its tributaries. The only other area that could have any possible claim upon the waters of the Gila River is Old Mexico, and even Mexico could not obtain any water from that stream in time of drought when the water was needed—

and (5) that the waters of the Gila River and its tributaries shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of Article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters apportioned by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply

one-half of any deficiency which must be supplied to Mexico by the lower basin.

During the consideration of the Colorado River compact by the Arizona Legislature those who opposed the approval of that agreement asserted that if the Legislature of Arizona ratified the Colorado River compact it would place a cloud upon the appropriation of all waters in the State of Arizona. Some were even so frightened as to think in case the Senate should ratify a treaty with Mexico granting a certain quantity of water to that country and the demand was made for it, that the treaty would be the supreme law of the land, and that the gates of the Roosevelt Dam or the gates of the Coolidge Dam would have to be opened and water turned down to Old Mexico.

It is an utterly foolish thing, a thing that it is physically impossible to do, but at the time it made an impression upon the minds of many people in the State of Arizona. They felt that they had in existence at this time actual, completely protected, bona fide, vested rights—if I knew of any other term that would describe the perfect water right which they possess I would use it—and they did not want to agree that a cloud of any kind could be placed upon their title to the use of that water. I refer particularly to the water now being used under the Salt River project. Therefore there has been insistence from time to time that the Gila River, of which the Salt River is the principal tributary, be exempt from any claim in the future so far as water for Mexico is concerned. But it will be noticed, Mr. President, that the State of Arizona and the State of California, if this agreement shall be carried out, will mutually agree to share equally the Mexican burden out of the waters of the main stream of the Colorado River.

In truth and in fact that is the only place where any water could be obtained for use in Mexico. In our arguments with our California brethren we have

found a peculiar situation. It was their desire to place upon paper the total amount of water running in every little stream in the State of Arizona which was tributary to the Colorado River, add that to the total quantity of water in the main stream, and then say, 'This total quantity of water is subject to the burden of furnishing water to Old Mexico, or may be subject under some future treaty. Taking the total water of the Arizona tributaries and the

[41]

total water flowing in the main stream, we will divide the obligation to furnish water to Mexico upon that basis.'

The water that is to be furnished to Mexico must all come out of the main river; we all agree to that; but the net result of such figuring on paper would result in Arizona being compelled to supply the great bulk of the water that must be supplied to Mexico under any treaty, and would practically exempt California from furnishing any appreciable quantity of water at all.

Arizona's answer to that contention has been that it would be just as reasonable and just as sensible to include in the total quantity of water to be calculated the flow of the Sacramento or the San Joaquin Rivers in California as to include the flow of the Gila River. In time of drought, when Mexico would make the demand for water, it would be as impossible to obtain any water out of the Gila River and deliver it to Mexico as it would be to obtain water from the Sacramento River or the San Joaquin River and deliver it to Mexico. Therefore we have said, and I think justly and fairly, that we were willing to divide with California the burden of furnishing water to Old Mexico, to assume an equal part of that burden, but that the delivery must be made and the division must be made out of the water that is divisible, and from the only source where water is obtainable for Mexico; to wit,

the main stream of the Colorado River. That is the only place where Mexico could get it, and that is the only water that could be divided. It is unfair to add up the total quantity of water that could be impounded by the Roosevelt Dam and the Coolidge Dam and some other reservoir upon some other tributary stream in Arizona, for the reason, as I say, that, if in time of drought the gates of the reservoir were opened and the water allowed to flow out, not one drop would ever reach Mexico, because it would be compelled to flow down during the time of drought in a wide sandy river bed for hundreds of miles, and the water would be totally evaporated and lost, and Mexico could not obtain a drop of it.

We, therefore, say that it is unfair and unjust and that it is not equitable to use the quantity of water that exists in the Arizona tributaries, or may be found in them, as a basis for determining what quantity of water must be allocated to Mexico. The physical facts are against any such plan. We do say that Arizona is willing, as this amendment provides, to agree that if, under any treaty with Mexico, it is necessary for the States of the lower basin to furnish water to lands in Mexico, Arizona will furnish an equal quantity of that water with California out of the main stream of the Colorado River. We believe that to be a fair and a reasonable proposition, and one that upon investigation I am sure the senior Senator from California and his colleague will find is the only practical way in which the burden of furnishing water to Mexico can be met.

Mr. Shortridge. Mr. President, may I ask the Senator a question?

Mr. Hayden. I yield.

[42]

Mr. Shortridge. Do you proceed upon the theory that Arizona is entitled to the same quantity of water as California?

Mr. Hayden. In the main stream of the Colorado; yes.

Mr. Shortridge. Quite regardless of the population of the two States?

Mr. Hayden. If that were the issue, Mr. President, the State of Arizona would be entitled to much more water than the State of California. That is to say, in the total area within the drainage basin of the Colorado River there is a much larger population in the State of Arizona than there is in the State of California.

Mr. Shortridge. I merely wish to know the position the Senator is taking.

Mr. Hayden. We found——

Mr. Shortridge. Will you pardon me to put the question in this form, for it may hereafter be the subject of some comment:

Do you contend, as to two States divided by a given stream, that each State's right to the water is dependent upon population, present or future, or upon present irrigated lands or lands subject to future reclamation and irrigation? Is it dependent upon territory, or is it dependent upon population—upon one, or the other, or both?

Mr. Hayden. It seems to me that it would be impossible to use one or the other or both of those factors as a means of determining what the relative rights of the States are.

Mr. Shortridge. Would the Senator contend that State A, for example, which had a very limited population, was entitled to as much of the given water as State B, with a very great population?

Mr. Hayden. If State A, with limited population, were so situated that because of the topography of the country or for other reasons it could not use the water within any reasonable period of time, then the fact that an adjoining State happened to have a larger population which could use it would be one that should receive very careful consideration. That, I believe, is the view of the State of Nevada at this time.

The State of Nevada is so situated that it can not use the water, and therefore it does not ask for more than a reasonable amount. But where the two States, State A and State B, regardless of their population, have lands upon which the water can be placed to beneficial use, it does not appear to us in Arizona that merely because one State happened to be settled sooner than another, that is any reason why the development of the other State should be denied.

[43]

Mr. Shortridge. May I ask the Senator, then, a final question? I have gathered from his remarks thus far that he seemed to insist that Arizona was entitled to one full half of the given water. Has not that been the contention of the Senator?

Mr. Hayden. Yes; that has been the contention of my State; and so far as I am personally concerned I think that contention can still be urged in all equity and all justice. But inasmuch as the commissioners representing the State of Arizona have submitted the matter to the mediation of four governors, who went into the matter very carefully and found that they were entitled to a less amount, in order to compromise our differences we have agreed to accept less.

Mr. Shortridge. I merely wished to know the position of the Senator.

Mr. Pittman. Just a minute, Mr. President. The Senator has mentioned Nevada as claiming only 300,000 acre-feet. I wish to say that the position of Nevada in the matter is this:

That the sovereignty of States is equal, without regard to population; that the State of Nevada, under the law of appropriation, if it had irrigable lands to put it on, could take all of the water of the Colorado River legally and proceed to put it on those lands, if it did it without interfering with prior rights of some other State or some other people. We contend also

that the State of Nevada has at least an equal right in the benefits to be derived from the use of the water from that dam, whether for power or whatever it can legitimately use it for.

The facts are stated accurately, however. While the State of Nevada might contend for one-third of this water to be used at some future date in the development of the State, our engineers have come to the conclusion that there are only about 100,000 or so acres of land that it would be practicable to irrigate; and we estimate that 300,000 acre-feet will accomplish that. We have therefor entirely removed from consideration, as far as Nevada is concerned, the legal question which was raised by the Junior Senator from California. We know we can not use it—at least, we are so advised—and we are perfectly willing and glad to allow all the rest of that water to be divided, if it may be equitably, between the other two States.

Mr. Hayden. Mr. President, in conclusion, let me say that I have offered this amendment in good faith. I have offered it in the exact language in which it appeared in the CONGRESSIONAL RECORD of May 28, 1928, when printed at the request of the senior Senator from Nevada (Mr. Pittman). I have offered it in the exact language as prepared by Mr. Francis Wilson, of New Mexico, the interstate river commissioner of that State, a disinterested person, a lawyer of great ability, a man of high character, who honestly and sincerely has sought on every and all occasions to bring about a settlement of this controversy between the States of Arizona and California with respect to the water of the lower basin.

[44]

I hope that the senior Senator from California and his colleague will take the amendment and study it. If they can suggest any better way of arriving at a settlement of our difficulties based upon this amendment, if they can suggest changes in it that will be

equitable as between the two States, I shall be delighted to confer with them and to do everything within my power to bring this matter to an adjustment.

As I understand the parliamentary situation, the House bill has been substituted for the Senate bill, and there now appears upon our desks as an amendment to the House bill the Senate bill as reported to this body. So there is one amendment pending; and the amendment which I have now offered, and which is now pending, is the only amendment to the bill at the present moment upon which a vote could be taken. Am I correct in that assumption?"

The debate on H. R. 5773 and the proposed amendments continued on December 7, 1928 at which time Senator Pittman of Nevada commented (70 Cong. Rec. 232):

"What is the difficulty? We have only minor questions involved here. There is practically nothing involved except a dispute between the States of Arizona and California with regard to the division of the increased water that will be impounded behind the proposed dam; that is all. An agreement has been entered into between the seven States interested in this river by which half of that water is retained to the four upper States and half of it let down to the three lower States. The four upper States have ratified the agreement. The question is now for Arizona to ratify the agreement. Arizona, as I understand, will ratify the agreement whenever there shall be a provision in the bill or a separate agreement between Nevada and Arizona and California dividing the water let down to the three lower States. Of the 7,500,000 acre-feet of water let down that river they have gotten together within 400,000 acre-feet. They have got to get together, and if they do not get together Congress should bring them together."

There followed a lengthy discourse by Senator Johnson on California rights, which is of some importance but not

vital to this compilation, except for the following passage beginning at 70 Cong. Rec. 235:

"Mr. Hayden. Mr. President, will the Senator yield?

The Presiding Officer. Does the Senator from California yield to the Senator from Arizona?

Mr. Johnson. I yield.

[45]

Mr. Hayden. Can the Senator tell me how many acres are now being irrigated in Imperial Valley?

Mr. Johnson. Approximately 400,000.

Mr. Hayden. The district comprises a larger area?

Mr. Johnson. Very much larger.

Mr. Hayden. I understood the Senator to say 476,000 acres.

Mr. Johnson. The Senator may be right. Under the appropriation the canals constructed and now in use provide for about 515,000 acres.

Mr. Hayden. The reason why less than the total area under the canal is irrigated is, as I understand it, because with the present unregulated flow of the river there is not water enough to irrigate those lands.

Mr. Johnson. That is true in large measure.

Mr. Hayden. So that it could not be reasonably expected that there would be any material increase in the area of land irrigated within the present limits of the Imperial irrigation district unless Boulder Canyon Dam were built.

Mr. Johnson. To a large extent that is true.

Mr. Hayden. So that whatever these water rights may be, although they may date back to 1896, there is no way in which the water to supply those lands can be obtained except by the construction of Boulder Canyon Dam.

Mr. Johnson. Adequate water, I will say. I think that is quite so. There are constant accretions and constantly new land, as the Senator knows, is being put under irrigation, but to take a large area I think we

would need the storage capacity in order to accomplish the desired results.

Mr. Hayden. Warning in that respect has come to the farmers of Imperial Valley on more than one occasion, because they have suffered a shortage of water and have lost large sums in perishable crops.

Mr. Johnson. Quite so. In one year there was a drought, which, I think, caused a loss of $5,000,000.

Mr. Hayden. I am merely bringing out the fact to illustrate that however far back this water right may date—and it may go back to 1896, indeed—it is not a perfected water right in the sense that it supplies all the water necessary for the irrigation of the land in the Imperial Valley and that something must be done to perfect

[46]

it, to wit, secure appropriations from Congress, build a dam and impound the water. It is the contention of the people of Arizona that under those circumstances it shall not be urged that the maximum amount applied for in 1896, which can not be obtained from the river's natural state, is the limit of California's water right.

Mr. Johnson. That is a very natural contention, too. I am not going to quarrel with the Senator about his contention in that regard. In fact, I would rather not quarrel with him at all. But the difficulty is that I think he makes it necessary. He thinks I make it necessary, and so there we are."

On December 8, 1928, Senator Bratton of New Mexico had printed a proposed amendment to section 4(a) as follows:

"SEC. 4. (a) This Act shall not take effect and no authority shall be exercised hereunder, unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact mentioned in section 12 hereof, and the President, by public proc-

lamation, shall have so declared, or (2) if said States fail to ratify the said compact within one year from the date of the passage of this Act then, until six of said States, including the State of California, shall ratify said compact and shall consent to waive the provisions of the first paragraph of article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States signatory thereto, and shall have approved said compact without conditions, save that of such six-State approval, and the President by public proclamation shall have so declared: Provided, That in either event the ratification act of the State of California shall contain a provision agreeing that the aggregate annual consumptive use by that State of waters of the Colorado River shall never exceed 4,400,000 acre-feet of the water apportioned to the lower basin by paragraph (a) of article III of said compact, and that the aggregate beneficial consumptive use by that State of waters of the Colorado River shall never exceed 500,000 acre-feet of the water apportioned by the compact to the lower basin by paragraph (b) of said article III; and that the use by California of the excess or surplus waters unapportioned by the Colorado River compact shall never exceed annually one-half of such excess or surplus waters; and that the limitations so accepted by California shall be irrevocable and unconditional, unless modified by mutual agreement subsequently entered into by all of the States affected, to wit: Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, nor shall said limitations apply to water diverted by or for the benefit of the Yuma reclamation project for domestic, agricultural, or power purposes except to the portion thereof consumptively used in California for domestic and agricultural purposes."

In explanation of his amendment, Senator Bratton said (70 Cong. Rec. 333):

"As I understand, California holds to the belief that 4,600,000 acre-feet is an irreducible minimum. Arizona contends that a maximum of 4,200,000 acre-feet is the largest that she will consider. Personally, I am not wedded to either figure. The thing that is uppermost in my mind is to do equity and justice as nearly as can be done toward both States, and, at the same time, pass a bill that will be effectuated, and will secure the results which we all desire.

I think we should adopt that course. The two States have exchanged views, they have negotiated, they have endeavored to reach an agreement, and until now have been unable to do so. This controversy does not affect those two States alone. It affects other States in the Union and the Government as well.

Without undertaking to express my views either way upon the subject, I do think that if the two States are unable to agree upon a figure then that we, as a dis-interested and friendly agency, should pass a bill which, according to our combined judgment, will justly and equitably settle the controversy. I suggest 4,400,000 acre-feet with that in view. I still hold to the belief that somewhere between the two figures we must fix the amount, and that this difference of 400,000 acre-feet should not be allowed to bar and preclude the passage of this important measure dealing with the enormous quantity of 15,000,000 acre-feet of water and involving seven States as well as the Government.

Mr. King. Mr. President, will the Senator yield?

Mr. Bratton. I yield.

Mr. King. I will ask the Senator if it is not a fact that at the time when the governors' conference considered the matter and recommended a settlement upon a basis of 4,200,000 acre-feet to California there had not been fully discussed and fully appreciated the fact that there was probably a million acre-feet subject to capture which, under the compact, was allocated to Arizona and to California, so that if 4,200,000 acre-

feet were awarded out of the 7,500,000 there would be an additional 500,000 acre-feet out of this 1,000,000 acre-feet which, under the compact, was to be allocated to the two States, so California in the aggregate would get 4,700,000 acre-feet?

Mr. Bratton. That is true if the estimated surplus actually exists. At the same time, Arizona would get her 3,000,000 acre-feet agreed to by the governors as her just share of the allocated water, plus 500,000 acre-feet, being one-half of the unallocated surplus, so that while California would get 4,700,000 acre-feet Arizona would get 3,500,000 acre-feet. The surplus to which the Senator from Utah refers would be equally divided between Arizona and California. Neither State would get an advantage by reason of the division of the surplus."

[48]

The Phipps Amendment to the Hayden amendment to the Johnson substitute (of the language of S. 728 for that of H. R. 5773) was offered on December 10, 1928 (70 Cong. Rec. 324):

"Mr. Phipps. Mr. President, will the Senator from New Mexico yield to me for a moment for the purpose of presenting an amendment?

Mr. Bratton. I yield to the Senator.

Mr. Phipps. I understand that the pending amendment is the one offered by the junior Senator from Arizona (Mr. Hayden). I desire to offer an amendment to that amendment, which I believe is permissible under the rule in force.

The Presiding Officer. The Chair will ask the Senator from New Mexico whether he has submitted his amendment? Is it pending?

Mr. Bratton. It has been printed and is lying on the table, but has not been formally proposed.

The Presiding Officer. Then the amendment of the Senator from Colorado to the amendment will be in order.

Mr. Phipps. I ask to have my amendment to the amendment printed in the RECORD.

There being no objection, the amendment was ordered to be printed in the RECORD as follows:

SEC. 4(a). This Act shall not take effect and no authority shall be exercised hereunder and no work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, and no water rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or perfect any claims to the use of water pertinent to such works or structures unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact, mentioned in section 12 hereof, and the President by public proclamation shall have so declared, or (2) if said States fail to ratify the said compact within one year from the date of the passage of this Act then, until six of said States, including the State of California, shall ratify said compact and shall consent to waive the provisions of the first paragraph of Article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States signatory thereto, and shall have approved said compact without conditions, save that of such six-State approval, and the President by public proclamation shall have so declared, and, further, until the State of California, by act of its legislature, shall agree with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this Act,

[48a]

that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California,

including all uses under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million six hundred thousand acre-feet of the waters apportioned to the lower basin States by the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

On page 7, strike out lines 4 to 12, inclusive, and insert in lieu thereof the following: 'permanent service and shall conform to paragraph (a) of section 4 of this Act. No person shall'.

[49]

Senator Phipps' amendment (in the last portion quoted) consisted of an amendment to Sec. 5 requiring that all water delivery contracts executed by the Secretary of the Interior should be for "permanent service and shall conform to paragraph (a) of Section 4 of this Act".

The question of division of water continued in an exchange between Senators Johnson and King (70 Cong. Rec. 330):

"Mr. Johnson. Speaking in round numbers, the annual consumption of water that is constantly, continually utilized is 2,100,000 acre-feet, I think, in the Imperial Valley; but I will segregate the figures as best I can if the Senator desires them.

Mr. King. Mr. President, the hearings disclose that the volume in the Colorado River often is less than 1,200 second-feet, and, as I read the record, I am inclined to believe that the quantity of water used in the Imperial Valley is less than that indicated by the Senator from California. The Senator knows that even if I had the power I would not deprive the people of Imperial Valley of a single drop of water to which they are entitled. The quantity of water which they

have used from year to year they are entitled to have in the future. If they have actually applied to beneficial use 2,000,000 acre-feet, then they should in the future have the same amount.

As I have indicated, in view of the claims of the Senator from California that his State should have 4,600,000 acre-feet and in addition 500,000 acre-feet of a claimed unappropriated 1,000,000 acre-feet, and in view of the fact that the necessity for the 4,600,000 acre-feet partly rests upon the assumption that the Imperial Valley has used 2,000,000 acre-feet, then it is important to determine just what amount the Imperial Valley has used.

If but 300,000 acres have been cultivated annually and twelve or fifteen hundred thousand acre-feet are all that have been actually applied and all that are actually necessary to cultivate the lands which annually have been irrigated, then it would seem that there is sufficient reason for the contention of Arizona that California should not receive the 4,600,000 acre-feet as claimed.

Mr. Johnson. I do not know whether the Senator is speaking from the legal standpoint now or from an equitable standpoint that ultimately he would like to see adopted. From the legal standpoint they are entitled under their filings to water for the purpose of irrigation that they put to beneficial use in the territory covered by the particular filing. There is no question on that score.

Mr. King. I am not certain that I understand the Senator, but

[50]

if I interpret his position correctly there would be some question. To illustrate my meaning, if the people of Imperial Valley have made filings for 5,000,000 acre-feet of water and have used only 1,000,000 acre-feet annually, that would be the measure of their vested right for which Congress should legally and equitably provide.

Mr. Johnson. No; as I understand, the filings are made for the use of water for a particular designated territory, and then the water is appropriated for beneficial use for that particular designated territory.

Mr. King. Mr. President, if pursuant to the filing for a particular designated territory, water is used upon that territory, and a right acquired, then there would be no disagreement between my friend and myself. If, however, there is a filing by the Imperial Valley corporations or by individuals or corporations in Arizona or California which is not followed by actual physical appropriation upon the lands in question, that would not be the basis of a vested right so far as we desire to provide for vested rights in the bill which is under consideration.

Mr. Johnson. No, Mr. President—and I hope the Senator from New Mexico will pardon me, for this will be my last interruption upon that subject, and only in response to my friend from Utah do I trespass upon the time of the Senator from New Mexico—when an appropriation is made for a particular territory, if the water is put to beneficial use and then reasonable diligence is exercised in utilizing additional water in that territory for additional land, the right is a perfected right under the water law of the West."

The problem of the Gila River was discussed by Senators Hayden and Phipps at 70 Cong. Rec. 335 and 336:

"Mr. Hayden. Under the circumstances I should like to inquire of the Senator from Colorado how he arrives at the figure 4,600,000 acre-feet of water instead of 4,200,000 acre-feet as proposed in my amendment?

Mr. Phipps. It was just about as difficult for me to arrive at 4,600,000 acre-feet as it would have been to arrive at 4,200,000 acre-feet. The arguments pro and con have been debated in the committee for quite a period of time. The contentions made by the Senators from Arizona have not been conclusive to my

mind. For instance, I will refer to the fact that Arizona desires to eliminate entirely all waters arising in the water-shed and flowing out of the Gila River.

Mr. Hayden. There is nothing of that kind in the Senator's amendment.

[51]

Mr. Phipps. There is nothing of that kind in the Senator's amendment, but that has been one of the arguments advanced by California as being an offset to the amount to which Arizona would try to limit California.

Mr. Hayden. If the Senator thought there was force in that argument, I should think that he would have included in his amendment a provision eliminating the waters of the Gila River and its tributaries, as my amendment does.

Mr. Phipps. I do not consider it necessary because the bill itself, not only the present substitute measure but every other bill on the subject, ties this question up with the Colorado River compact.

Mr. Hayden. My amendment does that.

Mr. Phipps. Yes; that is true, but under estimates of engineers—one I happen to recall being made, I think, by Mr. La Rue—notwithstanding all of the purposes to which water of the Gila may be put by the State of Arizona, at least 1,000,000 acre-feet will return to the main stream. Yet Arizona contends that that water is not available to California; whereas to-day and for years past at least some of the waters from the Gila River have come into the canal which is now supplying the Imperial Valley.

It is not a definite fixed fact that with the enactment of this proposed legislation the all-American canal is going to be built within the period of seven years; as a matter of fact, it may not be built at all; we do not know as to that. But I do not think that the water from the Gila River, one of the main tributaries

of the Colorado, should be eliminated from consideration. I think that California is entitled to have that counted in as being a part of the basic supply of water.

Mr. Hayden. I will state to the Senator that the primary reason why the Colorado River compact was not approved by the State of Arizona was that the Gila River and its tributaries were included in the Colorado River Basin. The people of Arizona felt—and justly so—that they had appropriated and put to beneficial use all of the waters of that stream, and that by remaining out of the compact under no circumstances could the waters of that stream be burdened with furnishing any water to Old Mexico, while by entering the compact they would assume a liability that does not at the present moment exist. Such being the case, since the Gila River is the very lifeblood of our State and the great majority of the people of Arizona live within its drainage, they felt that they were asked to do more than they should be required to do in approving that Interstate Agreement.

Mr. Pittman. Mr. President——

[52]

The Presiding Officer. Does the Senator from Arizona yield to the Senator from Nevada?

Mr. Hayden. I do.

Mr. Pittman. I think it is true, as stated by the Senator from Colorado, that Mr. La Rue has estimated that even after all of the water of the Gila that may be put to beneficial use by every means, even including pumping, is taken out, the return flow will still supply 1,000,000 acre-feet at the mouth of that river where it flows into the Colorado.

Mr. Hayden. No; the Senator from Nevada is mistaken. If the Senator will examine Mr. La Rue's report, he will find this to be the fact: That if three or more million acre-feet of water were diverted out of the main stream of the Colorado River and conveyed

into the lower Gila Valley, and there used for irrigation, after a water table was established in irrigating some 800,000 acres of land, the return flow from that land would provide a very substantial amount of water for Mexico, because it could be used at no other place. Originally, however, that water must be diverted from the main Colorado River, diverted out of the Colorado River for irrigation of lands in the Gila Valley, and would represent but little, if any, water from the watershed of the Gila River in Arizona.

Mr. Pittman. Does the Senator know what he figured the present return flow is to the Colorado from the Gila?

Mr. Hayden. The figures that Mr. La Rue used must have been derived from the record of stream measurements made by the United States Geological Survey. Over a long period of years the Geological Survey records will show an average run-off into the Colorado River of somewhere in the vicinity of a million acre-feet. That record goes back over a long period of years. The record will show a continual diminution of the run-off, first, because of the construction of the Roosevelt Dam; second, other uses for irrigation in the drainage area of the Gila; and, more recently, the construction of the Coolidge Dam. So that as reservoirs are constructed on the Gila and its tributaries, the quantity of water that will run out of that stream into the Colorado River will be reduced. The only way in which the water discharged from the mouth of the Gila River can be increased is by diverting water from the Colorado as proposed in the plan of irrigation which the State of Arizona has recommended, using that water to irrigate lands in the lower Gila Valley.

* * * * * *

Mr. Hayden. Nothing could prevent the return and drainage water from passing into Mexico.

But there is another side of the story. What I have stated is true of every acre irrigated in Colorado, Wyoming, New Mexico, Utah, Nevada, or Arizona, because in each case when the water is applied to the land some part of it can return to the stream, and ultimately go down to Mexico. In the Imperial Valley, however, there is no chance there for any return flow. There you are at the bottom of the bowl, with the result that from a broad national point of view it is uneconomic to irrigate lands in the Imperial Valley.

An acre-foot of water used in Colorado will probably return 50 per cent to the stream. An acre-foot of water used in Arizona will return at least 25 per cent to the stream for additional use; but an acre-foot of water diverted for use in the Imperial Valley is gone forever. There is no place where any part of it can be used again. Therefore, when the Californians appear before the Congress of the United States they set up not the highest use of water, not the most economic advantage that could be taken of a national asset. That is not the basis of their claim. The basis of their demand is that of necessity, that they must have so much water. The senior Senator from California (Mr. Johnson) himself in his remarks the other day, stated that the Imperial irrigation district claimed the right to waste 900,000 acre-feet of water into the Salton sink. If that water were used in the upper basin, if it were used in Arizona, it would irrigate more than 200,000 acres of land. Its use in the Imperial Valley, where there is no land below that the water can be again applied to beneficial use, means a loss to the Nation of farms and homes for thousands of American citizens.

Let me make it perfectly clear to the Senator from Nevada that if that is all the objection any one has to the amendment I have offered—that it lays a claim to return waters of the Gila River passing out of the mouth of that stream into old Mexico—we can very

readily change the amendment to cure that fault without difficulty.

But I return to the question that I addressed to the Senator from Colorado (Mr. Phipps). He states that the State of California shall be allowed 4,600,000 acre-feet of water. The only basis there is for fixing that figure is that the State of California has demanded that much water. The State of California has said that her necessities are such that she must have that much water to irrigate lands within the State and to furnish water for domestic use in the State of California.

Mr. Shortridge. Mr. President, may I ask the Senator a question?

The Presiding Officer. Does the Senator from Arizona yield to the Senator from California?

Mr. Hayden. I yield.

[54]

Mr. Shortridge. Suppose it is agreed that California shall have that quantity of water. In view of the physical facts, will not Arizona have ample for all her purposes and uses? Will there not be plenty left for her?

Mr. Hayden. I am sorry that there will not. That the total quantity of water is so limited is the basis of the controversy between Arizona and California.

Mr. Shortridge. Including, of course, all your tributary waters, which you claim to own, I take it, in fee simple, absolutely?

Mr. Hayden. The State of Arizona claims the waters of her tributaries to no more or no less extent than any other State would claim the tributaries of the Colorado River within its boundaries. If the water has been placed to beneficial use, then a right has been acquired to use it. If it has not been placed to beneficial use, of course the water will pass into the main stream of the Colorado River and become part of the body of water which is divisible.

Mr. Shortridge. Arizona does not claim title to the water after it has passed into the stream on its way to the gulf?

Mr. Hayden. Not at all."

At 70 Cong. Rec. 339 Senator Phipps modified his proposed amendment in two respects:

1. He suggested that California's limitation should be irrevocable and unconditional.

2. He suggested a change from the one year period for 6-state ratification of the compact to six months.

The debate on this phase was:

"Mr. Bratton. Mr. President, a parliamentary inquiry.

The Presiding Officer. The Senator will state it.

Mr. Bratton. Is the amendment offered by the senior Senator from Colorado (Mr. Phipps) subject to amendment?

The Presiding Officer. It is not at this stage.

Mr. Bratton. That is the inquiry I wanted to propound. In view of that, if the Senator from Arizona will permit me——

Mr. Hayden. Certainly.

[55]

Mr. Bratton. I suggest to the Senator that on page 2, line 18, following the word 'agree,' there should be inserted the words 'irrevocably and unconditionally.'

Mr. Phipps. Will the Senator give me a reference to the substitute bill, the Johnson bill, now before the Senate?

Mr. Bratton. I refer to the amendment offered by the Senator himself as a substitute.

Mr. Johnson. Will the Senator state again the line and page?

Mr. Bratton. It is the amendment of the senior Senator from Colorado, page 2, line 18. Following the word 'agree' insert the words 'irrevocably and unconditionally.'

Mr. Phipps. Mr. President, it had not occurred to me that should be necessary. An agreement on the part of a State by its legislature may be looked upon as binding upon the State as a moral obligation. However, I do not see that any harm would be done by making the modification the Senator suggests; therefore I will ask permission——

The Presiding Officer. Does the Senator from Colorado withdraw his amendment?

Mr. Phipps. No. I was about to ask permission to perfect my amendment by adding the words which have been suggested by the Senator from New Mexico.

The Presiding Officer. The Senator from Colorado modifies his amendment by adding the words suggested by the Senator from New Mexico.

Mr. Phipps. I desire to perfect my amendment by adding after the word 'agree,' in line 18, on page 2 of my amendment, the words 'irrevocably and unconditionally.' Then the amendment would stand in that form.

Mr. President, at this point I want to make the request that I be further permitted to make another change in the pending amendment and that is to make the term for agreement under the 7-State compact, the time during which the 7-State compact may be entered into before a 6-State compact shall become effective, six months instead of one year. It seems to me that one year is perhaps longer than necessary in which all of the seven States might, if they are going to at any time, agree to a 7-State compact.

The Presiding Officer. The Chair will state that the Senator has a right at any time before his amendment is acted upon to modify it as he desires.

Mr. Phipps. I was aware of that, but I desired that those who are deeply interested in this amendment should know my reasons and the modus, and then I desire to perfect my amendment by changing 'one year' to 'six months.'"

On December 11, 1928, Senator Hayden, for parliamentary reasons, withdrew his proposed amendment. As a result, Senator Phipps' proposed amendment to the Hayden amendment to Sec. 4(a) lost its status and was again proposed by Senator Phipps without change in language (including the proviso added to Sec. 5) (70 Cong. Rec. 382):

"Mr. Hayden. Mr. President, I should like to have the attention of the Senate, that I may discuss the parliamentary situation as it exists and what I may do, if possible, to remedy it, in order that the amendment offered by the Senator from Colorado (Mr. Phipps) may be perfected.

As I understand the situation, the amendment offered by the Senator from Colorado (Mr. Phipps) is an amendment in the second degree, an amendment to the amendment which I have offered, and therefore not subject to amendment. The Senator's amendment contains three substantive propositions, upon which there is a difference of opinion between the States of Arizona and California, and we must vote upon all of them as one if his amendment is not subject to amendment. But if the Senator's amendment could be made subject to amendment the Senate could vote upon the various propositions separately. For example, the Senator has taken from another part of the bill a provision that the State of California shall have 4,600,000 acre-feet of water on the Colorado River. Arizona agrees that the State of California shall have 4,200,000 acre-feet of water.

I desire it arranged so that the Senate may vote upon the question of whether it shall be one figure or the other.

I should like to inquire of the President of the Senate, whether, if I should withdraw the amendment which I have offered, would then the amendment offered by the Senator from Colorado be an amendment in the second degree and subject to amendment?

The Vice President. Will the Senator state his question again?

Mr. Hayden. If I should withdraw the amendment which I have offered, to which the amendment of the Senator from Colorado is a substitute, will his amendment then be an amendment in the first degree and subject to amendment?

The Vice President. The amendment of the Senator from Colorado would have to go along with the amendment of the Senator from Arizona if the Senator from Arizona withdraws his amendment.

[56a]

Mr. Hayden. Would it not then be possible for the Senator from Colorado to immediately reoffer his amendment?

The Vice President. The Senator from Colorado could do that.

Mr. Hayden. I want to state to the Senate that what I am trying to accomplish is to get a vote on the one particular question of whether the quantity of water which the State of California may divert from the Colorado River should be 4,200,000 acre-feet or 4,600,000 acre-feet. I can state in 15 or 20 minutes all the reasons why Arizona favors the lesser figure, and then the Senate may have a vote upon that question.

Mr. Phipps. Mr. President, will the Senator yield?

Mr. Hayden. I yield.

Mr. Phipps. I desire to call attention to the fact that 4,600,000 acre-feet was the figure adopted by the

Senate committee and was written in the substitute bill offered by the Senator from California (Mr. Johnson). Therefore it seems to me that the point comes right down to the question of 4,600,000 acre-feet as recommended by the Senate committee and 4,200,000 acre-feet as written in the amendment of the Senator from Arizona.

Mr. Hayden. And upon that particular issue and upon nothing else I desire to have a vote of the Senate at this time.

Mr. Phipps. The other item that is in the amendment to which the Senator calls attention, as I understand, is the provision regarding the Federal Power Commission. That is the only other matter, is it not?

Mr. Hayden. My amendment as originally offered provides for a 7-State ratification of the Colorado River compact. The Senator from Colorado in his amendment provides for a 6-State ratification. That is another question upon which I should like to have the Senate take a vote. If the Senate will bear with me for a moment, I desire to say that it is only fair to the State of Arizona that the several substantive propositions which are contained in the amendment of the Senator from Colorado and in my amendment be voted upon, each upon its own merits by the Senate, and not grouped together in one particular amendment. If I am privileged to do so, Mr. President, I withdraw, without prejudice, the amendment I have offered.

The Vice President. The Senator has that right. The amendment of the Senator from Arizona to the so-called Johnson amendment is withdrawn.

Mr. Hayden. Now, if the Senator from Colorado (Mr. Phipps) will again offer his amendment just as it is, we can proceed to debate it, to amend it, and to vote upon it.

[56b]

Mr. Phipps. Mr. President, I understand the Senator from Arizona has withdrawn his amendment.

I desire again to offer my amendment as it is now before the Senate.

The Vice President. The question is on agreeing to the amendment offered by the Senator from Colorado (Mr. Phipps).

Mr. Hayden. I offer the following amendment to the amendment offered by the Senator from Colorado.

Mr. Smoot. Let the amendments be now read.

The Vice President. The clerk will state the amendment of the Senator from Colorado and the amendment of the Senator from Arizona to the substitute amendment.

The Chief Clerk. On page 4 it is proposed to strike out all of lines 22 to 25, inclusive, and on page 5 to strike out lines 1 to 14, inclusive, and to insert in lieu thereof the following:

Sec. 4(a). This act shall not take effect and no authority shall be exercised hereunder and no work shall be begun and no moneys expended on or in connection with the work of structures provided for in this act, and no water rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or perfect any claims to the use of water pertinent to such works or structures unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact, mentioned in section 12 hereof, and the President, by public proclamation, shall have so declared, or (2) if said States fail to ratify the said compact within one year from the date of the passage of this act then, until six of said States, including the State of California, shall ratify said compact and shall consent to waive the provisions of the first paragraph of Article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States signatory thereto, and shall have approved said

compact without conditions save that of such 6-State approval, and the President by public proclamation shall have so declared, and, further, until the State of California, by act of its legislature, shall agree with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this act, that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed 4,600,000 acre-feet of the waters apportioned to the lower basin States by the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.'

[56c]

On page 6, strike out line 25, and on page 7, lines 1 to 8, inclusive, and insert in lieu thereof the following: 'permanent service and shall conform to paragraph (a) of section 4 of this act. No person shall.'

At 70 Cong. Rec. 383 Senator Hayden proposed an amendment to the Phipps amendment to Sec. 4(a) which would reduce the limitation on California from 4,600,000 to 4,200,000 acre feet per annum. This was defeated on a roll call vote (70 Cong. Rec. 384).

Senator Bratton then proposed a substitute to the Phipps amendment which would change the 4,600,000 to 4,400,000 acre-feet per annum for California (70 Cong. Rec. 385) and in explanation, he commented (70 Cong. Rec. 385):

"Mr. President, it is perfectly obvious to all of us that we have an immense project here, respecting which

the two States, California and Arizona, can not agree. The dispute has narrowed itself primarily to 400,000 acre-feet of water, California saying that 4,600,000 acre-feet is her irreducible minimum and Arizona insisting that California shall be limited to 4,200,000 acre-feet.

If this legislation shall be effectuated, the dam constructed, and the river controlled, and the benefits designed to be accomplished by the measure given full fruition, these States must ratify the compact. In my judgment that will never be accomplished if we give to one all that she asks and deny to the other everything she seeks.

It seems to me, therefore, Mr. President, that in justice to the two States, they having been unable to agree, we should tender our offices by dividing the difference and requiring California to limit herself in her act of ratification, irrevocably and unconditionally, to a maximum consumptive use of 4,400,000 acre-feet. That divides the difference and is the amount fixed in the amendment I have proposed. It differs from the proposal of the Senator from Colorado by reducing California's claim 200,000 acre-feet. It differs from the amendment of the Senator from Arizona by increasing California's consumptive use by 200,000 acre-feet.

[57]

I believe this is an equitable solution of the problem. It may not be entirely satisfactory to either State, but in my judgment it is the best compromise that is available at this time.

Mr. Ashurst. Mr. President, for years, in some portions of the press and on the floor of the Senate, Arizona has been accused of being unwilling to extend the hand of amity, compromise, and friendship on this bill. The accusation is false. Arizona scorns all bribes and wears no chains.

I am going to vote for the amendment just offered by the Senator from New Mexico, and by so doing

Arizona takes another step looking toward a compromise of the differences surrounding this legislation. In making this advance looking toward some composition of our differences, and in hope of reaching some *modus vivendi,* I trust that Arizona shall no longer be accused of stubbornness.

Mr. Johnson. Mr. President, the offer that has been made by the Senator from New Mexico (Mr. Bratton) is, I take it, an offer by way of compromise. The Senator from New Mexico represents one of the States of the upper Colorado River Basin. He, of course, is intensely interested in what shall be done with the waters of the Colorado, just as the States of the lower basin are equally interested in what shall be done with the waters of the Colorado.

It is a fact, sir, that in the State of California there are rights perfected to-day and those which may be perfected in the near future, rights indeed that under the law no human agency can take from the people who reside in the State of California, that far exceed the amount of water that is fixed as the maximum in the amendments that California ever shall use. Were I here in disinterested position, Mr. President, were the dire necessity of Imperial Valley not so clearly before me, sir, if I did not understand as few men upon this floor understand the absolute necessity of legislation of the character that has here been proposed, never for one instant would I assent to an amendment such as has been presented by the Senator from Colorado or that which has now been presented as an amendment by the Senator from New Mexico.

I venture the assertion, and I call upon men whose vision is greater perhaps than a mere limit[illegible] territory that they may represent, that never in the history of legislation has there been written into a law such a drastic provision as that which is suggested by the Senator from Colorado and that which is in part suggested by the Senator from New Mexico.

Do Senators realize what this provision is? In order that its citizens may be protected from flood, in order that its citizens may have what God gives even to the birds of the air and the beasts of the field, which is potable drinking water, it compels the State of California, before it shall consider even legislation of this sort, by act of its legislature 'irrevocably and unconditionally'—and I read the language of the amendment itself—to agree with the United States and for the benefit of

[58]

the other States of the Colorado River Basin——

> as an express covenant and in consideration of the passage of this act, that the aggregate annual consumptive use of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed 4,600,000 acre-feet.

More than that and within a brief period by perfected rights, that the law can not touch in this particular territory that is thus assured, can be obtained. Talk to me of taking water from the State of California? Not a bit of it! Not a bit of it! All the expert testimony—and I have put in the RECORD that of the distinguished engineer of the State of Nevada—is that if we give to the State of Arizona the water that the State of Arizona now asks, she can not by any possible process of irrigation use that water to the full or utilize all of it. All of the testimony that has been adduced reaches that conclusion, save that, of course, of some of the gentlemen connected with the State of Arizona.

But that is neither here nor there. I want Senators to understand what the amendment is. It is the most drastic amendment that was ever written into a law

against the people of a State, the most drastic thing that was ever asked of them. I would stand here and never tolerate it if I did not know that 60,000 people are in jeopardy in the Imperial Valley who demand and who ask and who beg and who pray that they may have the consideration of the Congress.

I say to the gentlemen from Arizona, 'You say that California shall have but 4,200,000 acre-feet.' We say, and the testimony of Mr. Francis Wilson is the best upon that subject, that the irreducible minimum of the State of California is 4,600,000 feet. You say to us, 'You must bind your people for all time in the future never to go beyond it by this amendment.' The amendment does not divide the water between Arizona and California. It fixes a maximum amount beyond which California can not go. I say to the gentlemen from Arizona, though I think it is a wicked amendment, though I think it is an amendment that harnesses the State of California and its people as they never should be harnessed in the days to come, though I believe it to be an injustice against those who reside in California and in its southern part to-day and those who may reside there in the future—I say to you that if 200,000 acre-feet of water will settle this controversy with them, whatever the wrong, whatever the injustice, whatever may be the yoke that is put upon our people, I will take that as a compromise and a settlement of the differences that exist.

But unless it be by compromise, this injustice ought not to be put upon us and the compromise should be that the amendment as written, with the permanent amount of water that the Senator from New Mexico (Mr. Bratton) offers, shall be adopted, and then that the bill shall be passed without further delay and without any filibuster

[59]

at all. If we can compromise, let it be done upon that basis, but do not require us to do what is unnecessary

and what ought not to be crowded down our throats unless it be actually by way of compromise.

Mr. Pittman. Mr. President, I want to say that the amendment of the Senator from Colorado (Mr. Phipps) now offered is substantially recommended by the committee. The bill as originally introduced by the Senator from California (Mr. Johnson) had no reference in it to water at all, but it became evident to the committee that there had to be some reference with regard to water because not only were the States of California and Arizona interested in this larger supply of water but the four upper States were interested as well. This amendment was offered in committee by the Senator from Wyoming (Mr. Kendrick) for the purpose of protecting the water rights of the four upper States. In other words, there are only 15,000,000 acre-feet in the river. Seven million five hundred thousand are forever to be retained in the upper States, to be put in use some time in the future.

Now, unless there was an agreement as to exactly how much water should go to the lower States out of the 7,500,000 acre-feet that went down to them, what might be the result? If Arizona stays out of the agreement, she would have her legal right to appropriate as much water as she could put to beneficial use. On the other hand, California would only be restricted by the 7,500,000 acre-feet that went down, with the result that there would be nothing in the compact to prevent California from using the entire 7,500,000 acre-feet and there would be nothing in the compact to prevent Arizona from using the 7,500,000 acre-feet if she never went into the compact.

So the upper States said: 'We have got to be assured that there is not used in the lower basin more than the 7,500,000 acre-feet because, if there is more used, then when we get ready to use it in the future it will not exist under the law of appropriation that applies in that section of the country.' Consequently,

in view of the fact that Arizona might never go into the compact, might never be bound by the compact, might be perfectly free to exercise her equal right and put to use as much as she could put to beneficial use, it was said in the committee, 'If Arizona does not come in and if it is limited to six States only, then we must be assured that California will not take the full 7,500,000 acre-feet and then Arizona take some more.' So the Senator from Wyoming (Mr. Kendrick) offered an amendment in committee, to which the committee agreed, and that amendment provided that California should never consumptively use of the Colorado River over 4,600,000 acre-feet.

The Phipps amendment does not do anything else except that it states how California shall ratify. The Congress of the United States could not impose it upon California unless California assented to it, because California already has sovereign rights over the water, and the law recognizes her right to use as much

[60]

as she can put to beneficial use. Consequently the Senator from Colorado (Mr. Phipps) has simply taken the amendment which was recommended by the committee and put it in legal language and provided a legal method for California to ratify it. I do not think it is any harder on California than it was before.

Let me now call attention to the fact that the committee adopted the Kendrick amendment. They adopted the amount that California demanded, which was 4,600,000 acre-feet. I voted for that amendment. Why? I voted for it because otherwise Arizona would not participate in the compact and would not participate in the division of water. In other words, it was apparent to me that California was so dissatisfied with it that we had to treat without Arizona. We treated without Arizona in the committee, and we put the amount in there that California demanded before the four governors at Denver.

I participated as a representative of Nevada for four weeks in the hearing at Denver, where the governors of the seven States met. Those governors decided that California was entitled to only 4,200,000 acre-feet of that water. They may have been right or wrong. The dispute has been going on for a long time. On the other hand, California contended that she had to have 4,600,000 acre-feet.

Now, we have this situation: We have the committee, which adopted the Kendrick amendment, standing for 4,600,000 acre-feet. We have the four governors of the upper States who arbitrated, standing for 4,200,000 acre-feet. We have a difference of just 400,000 acre-feet out of a total of 7,500,000. I think the proposition of splitting that in two is going to accomplish more good and get rid of more disputes than anything else that can possibly be done. I believe that if the two Senators from Arizona vote for 4,400,000 acre-feet, in accordance with the amendment of the Senator from New Mexico (Mr. Bratton), they will be able to go before their legislature and sustain that position and I believe if they do go before their legislature and sustain the proposition, that Arizona will ratify the 7-State agreement.

Mind you, this 6-State agreement is only an expedient. It is not what any of the seven States want. All of the seven States want a fair treaty between the seven States, and we have been striving to that end for several years. It looks to me as though we are on the eve of getting an agreement. I do not believe it is possible for the two Arizona Senators to pledge what the Arizona Legislature will do in this matter, but I believe that they have influence with it, and I believe when they go before the legislature and say 'We stated on the floor of the Senate that this was a fair compromise, and we were representing the sentiment of the people of the State,' the legislature will ratify it.

I think it would be a terrible mistake when everyone has reached the point of compromise as we have here. If California's allotment

[61]

is reduced 200,000 acre-feet out of 7,500,000 and Arizona concedes 200,000 acre-feet to California for the purpose of compromise, we should vote for it, because if we do not bitterness is bound to exist between these States. If we do not, there have got to be a number of other provisions in the bill to satisfy the other States, because there is fear in the four upper States with regard to any kind of a ratification except by all the States. That fear does not exist in my mind; I think it is perfectly groundless. I think it is as groundless as is the fear of Mexico getting any more water than she is getting now. However, I plead with the Senators to allow us to make the first compromise that has ever been made in seven years with regard to this matter, and vote to split these 400,000 acre-feet and make the quantity that California will receive 4,400,000 acre-feet.

Mr. Johnson. Mr. President, I thought I made myself plain upon this matter, but I want to make it doubly so. If we are compromising on the question of water, I will submit to what I think is an injustice; if we are compromising our controversy, I am willing to accept it; but I want to know first whether we are settling the controversy and whether or not we are settling the matters of difference. The junior Senator from Arizona (Mr. Hayden) has been very active, and I ask him if that is the situation?

Mr. Hayden. Mr. President, I have been very active submitting various suggestions of compromise to those who spoke for the State of California. I have had no response to those offers. The only thing that I could do was what I have done this morning, to submit the issues separately to the judgment of the Senate, and that is what we are doing now. We are taking up the

question of the quantity of water that the State of California shall receive, and let the Senate vote on it. When we come to other issues we shall again ask the Senate to vote on those. That is all we can do."

The Bratton amendment to the Phipps amendment was put to a vote and approved (70 Cong. Rec. 387), thereby establishing the 4,400,000 acre-feet per annum limitation on California.

[62]

Senator Hayden then stated that he proposed to offer an amendment differing in some respects from his original proposal (70 Cong. Rec. 387 *et seq.*):

"Mr. Hayden. Mr. President, as the senior Senator from California is well aware, there have been other issues in controversy between the States of California and Arizona with respect to the apportionment of water, one issue being whether or not the States of Arizona and California should share equally the burden of furnishing water to Mexico. Another was whether the Gila River, one of the principal tributaries of the Colorado River in Arizona, should be completely reserved for use in the State of Arizona.

In offering my original amendment I provided for both of those matters. I have had conferences with some gentlemen from California, and they have suggested some changes in that part of my proposal. I intend to submit it now, so that it may be printed for the information of the Senator from California and the entire Senate, in order that we may take it up for consideration later.

I now send the amendment to the desk and ask the clerk to read it for that purpose. I shall offer it later.

Mr. Johnson. Mr. President, has the amendment been printed.

Mr. Hayden. My original amendment was printed. I have made some changes in it.

Mr. Johnson. The original amendment that the Senator refers to is the one we passed upon, is it not?

Mr. Hayden. No, sir. The Senator will remember that I offered an amendment which was pending, which comprised——

Mr. Johnson. Why not have the amendment printed and lie on the table?

Mr. Hayden. I desire to have it read and printed and lie on the table.

Mr. Heflin. Let us have it read.

Mr. Johnson. Let us dispense with the reading of it for the moment and go on with the bill. Of course, the Senator has that right if he wishes.

Mr. Hayden. I prefer to have it read, so that the Senate may understand what it contains.

Mr. Johnson. All right.

[63]

The Vice President. The amendment will be read for the information of the Senate.

The legislative clerk read the amendment, as follows:

Amendment by Mr. Hayden to the amendment offered by the Senator from Colorado (Mr. Phipps): On page 3, after line 7, insert a new paragraph, as follows:

'The said ratifying act shall further provide that if by tri-State agreement hereafter entered into by the States of California, Nevada, and Arizona the foregoing limitations are accepted and approved as fixing the apportionment of water to California, then California shall and will therein agree (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive

beneficial consumptive use in perpetuity and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of Article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin and (5) that the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water which can not reasonably be applied to domestic and agricultural uses and (6) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact.'

The Vice President. The amendment will be printed and lie on the table."

Before action was taken on the above proposal Senator Hayden offered (70 Cong. Rec. 388) an amendment which would strike the provision for six-state ratification of the Colorado River Compact as contained in

the Phipps version of Sec. 4(a).

The amendment offered by Senator Hayden was defeated (70 Cong. Rec. 394) and the authorization for a six-state compact remained.

On December 12, 1928 the Senate again considered the Phipps amendment to Sec. 4(a). Senator Phipps suggested two changes in his proposal, which changed the first paragraph of 4(a) to read as finally adopted. The suggestions were made as follows (70 Cong. Rec. 459):

> "Mr. Phipps. Referring to the amendment which is now before the Senate, in order to remove any possible misunderstanding regarding the 4,400,000 acre-feet of water, I desire to perfect the amendment by inserting, on page 3, line 4, after the word 'by' the words 'paragraph (a) of article 3 of,' so that it will show that that allocation of water refers directly to the seven and one-half million acre-feet of water that are mentioned in paragraph 3.
>
> Mr. Hayden. I will state that I have no objection to the amendment offered by the Senator from Colorado to his own amendment, because it makes it even more in conformity with the amendment that I now offer.
>
> The Presiding Officer. The Chair will state that the Senator from Colorado has the right to modify his amendment.
>
> Mr. King. Mr. President, will the Senator yield?
>
> The Presiding Officer. Does the Senator from Arizona yield to the Senator from Utah?
>
> Mr. Hayden. I yield.
>
> Mr. King. If I may have the attention of the Senator from California and the Senator from Colorado, I direct attention to line 5, page 3, of the amendment offered by the Senator from Colorado. Let me read back a few words:

'plus not more than one-half of any excess or surplus waters unapportioned by said compact.'

I was wondering if there might not be some uncertainty as to what surplus waters were therein referred to. I think it was the intention to refer to the surplus waters mentioned in paragraph (b) of article 3 of the compact, being the 1,000,000 acre-feet supposed to be unappropriated.

Mr. Johnson. No; that is not quite my understanding. It is by no means certain that there is any other, and it is by no

[65]

means certain that there is the 1,000,000; but the language referred to any other waters.

Mr. King. Speaking for myself, I have no objection; but I was under the impression that the purpose was to link it with paragraph (b) so as to be sure that California was to receive one-half of the 1,000,000 acre-feet.

Mr. Johnson. Not necessarily. This gives one-half of the unapportioned water, and I think it is a better way to leave the matter.

Mr. King. If it is sufficiently certain to suit the Senators of the lower basin, I have no objection.

Mr. Johnson. I think it is."

Senator Hayden then formally offered his amendment which would add the second paragraph of 4(a), providing for a tri-state compact. In explanation, he said (70 Cong. Rec. 459 *et seq.*):

"Mr. Hayden. Mr. President, an examination of the amendment offered by the Senator from Colorado (Mr. Phipps) will disclose that it proposes that the State of California shall agree with the United States, for the benefit of the States of Arizona and Nevada, that the aggregate annual consumptive use of water

from the Colorado River by the State of California shall not exceed 4,400,000 acre-feet. Further, that the State of California may have one-half of any excess or surplus waters unapportioned by the Colorado River compact.

The first part of my amendment is a mere corollary to the amendment offered by the Senator from Colorado. It provides that the remainder of the seven and one-half million acre-feet there shall be apportioned to the State of Nevada 300,000 acre-feet, and to the State of Arizona 2,800,000 acre-feet, which, combined, with 4,400,000 acre-feet which the State of California will use, completely exhausts the seven and one-half million acre-feet apportioned in perpetuity to the lower basin.

The second proposal in my amendment is that the State of Arizona may annually use one-half of the surplus or unapportioned water, which is likewise a corollary to the proposal made by the Senator from Colorado, which likewise disposes of the total quantity of surplus or unapportioned waters in the lower basin.

Mr. King. And that is provided in the compact, is it not?

Mr. Hayden. Yes; and the compact has been so interpreted. If the Senator from Utah is interested in an interpretation of the meaning of surplus unapportioned water, I might well

[66]

read to him an answer to a question I addressed to Mr. Hoover shortly after the compact was written. I asked Mr. Hoover:

> What is the estimated quantity of water which constitutes the undivided surplus of the annual flow of the Colorado River and may the compact be construed to mean that no part of this surplus can be beneficially used or consumed in either the upper or the lower basins until 1963, so that the entire quantity above the apportionment must flow into Mexico,

where it may be used for irrigation and thus create a prior right to water which the United States would be bound to recognize at the end of the 40-year period?

Mr. Hoover's answer to that question was:

The unapportioned surplus is estimated at from 4,000,000 to 6,000,000 acre-feet, but may be taken as approximately 5,000,000 acre-feet.

He referred to the unapportioned surplus in both basins.

The right to the use of unapportioned or surplus water is not covered by the compact. The question can not arise until all the waters apportioned are appropriated and used, and this will not be until after the lapse of a long period of time, perhaps 75 years. Assuming that each basin should reach the limit of its allotment and there should still be water unapportioned, in my opinion, such water could be taken and used in either basin under the ordinary rules governing appropriations, and such appropriations would doubtless receive formal recognition by the commission at the end of the 40-year period.

There is certainly nothing in the compact which requires any water whatever to run unused to Mexico, nor which recognizes any Mexican rights, the only reference to that situation being the expression of the realization that some such right may perhaps in the future be established by treaty. As I understand the matter, the United States is not 'bound to recognize' any such rights of a foreign country unless based upon treaty stipulations.

So Mr. Hoover, who was the chairman of the commission which made the compact, expresses it as his opinion that surplus and unappropriated waters above the allocation in the compact are unaffected by the compact, and are subject to appropriation in any State. I think that is not only a very important interpretation

of the compact, but it is a sane, logical, and legal conclusion.

Mr. King. Mr. President, will the Senator yield?

[67]

Mr. Hayden. I yield.

Mr. King. Does the Senator interpret the compact to mean that if there is any unappropriated water in addition to the 1,000,000 acre-feet referred to in the compact, that that is subject to the same disposition or division as the 1,000,000 acre-feet?

Mr. Hayden. There is no question about it, in the light of the statement I have just read, which was written to me in answer to a specific question which I propounded to Mr. Hoover.

Now, I direct the attention of the Senate—and Senators will find on their desks a copy of my amendment—to the fifth and sixth items of it. The fifth item, beginning in line 22, reads:

> That the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water, which can not reasonably be applied to domestic and agricultural uses.

That is a mere repetition of language which appears in the Colorado River compact. In section (e), Article III, of the Colorado River compact are found these words:

> The States of the upper division shall not withhold water, and the States of the lower division shall not require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses.

I will state frankly that I placed that provision in my amendment after conferences with gentlemen representing the State of California, who thought it proper that there should be the same pledge as between the

three States in the lower basin as is contained in the original compact with respect to the upper and the lower basins. I could see no harm in it; on the contrary, it might, in time, be a valuable provision for the benefit of some State which might otherwise be injured. If a provision of that character is found in the original compact, it would therefore be well to repeat it in any supplemental agreement between Arizona and Nevada.

The sixth provision in my amendment is:

> That all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact.

That provision conforms to a similar provision in the Phipps amendment, which states that such uses, that is, by the State of California, shall always be subject to the terms of said compact. So that as to five of the substantive propositions

[68]

that are contained in my amendment, as numbered in it, there can be no controversy. I have mentioned these matters first so that we may get down to the gist of my amendment.

Proposal No. 3 in my amendment is——

> That the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State.

The fourth provision is——

> that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of Article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are

surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River one-half of any deficiency.

Let me read the portion of the compact to which reference is made in my amendment. It is paragraph (c) of Article III:

> If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River system, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b).

That is, over and above the seven and a half million acre-feet apportioned in perpetuity to each basin, a total of 15,000,000 acre-feet, and over and above 1,000,000 acre-feet additional which the lower basin is given the right to use. From that surplus of unapportioned water Mexico must first be satisfied.

Continuing the reading of paragraph (c) of Article III of the compact:

> And if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lees Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d).

In paragraph (d) the upper basin is required to deliver

[69]

75,000,000 acre-feet during the course of any 10-year period, but, in addition to that, the upper basin assumes the duty of supplying one-half of any water that may

be demanded by Mexico under any treaty, in the event that the surplus waters are not sufficient to meet the Mexican demand.

My proposal is that as far as the lower basin is concerned the State of Nevada shall be exempt from furnishing any water to Mexico under any conditions. The State of Nevada has been so modest in its demands, asking for only 300,000 acre-feet of water, which quantity of water is so small that we have felt in Arizona that there should never be any question but that the State of Nevada should have all of it.

Mr. King. Mr. President, will the Senator yield?

Mr. Hayden. I yield.

Mr. King. Does the Senator interpret the compact to mean that if there should be, for instance, 16,000,000 acre-feet of water in the river, and by any treaty negotiated between the two Governments Mexico should be allocated a million acre-feet, that that million acre-feet should be taken from the million surplus; that is, the 16,000,000 and not any part of the 15,000,000 be called upon to meet that payment?

Mr. Hayden. The compact, from the literal interpretation of its words, means that the upper basin and the lower basin shall meet that deficiency equally, regardless of how much water is apportioned in each basin.

In further answer to the question of the Senator from Utah, the compact states that any water must first be supplied to Mexico out of the surplus or unapportioned water; but if it is necessary to supply Mexico with any water out of that water which is apportioned in each basin—that is to say, the 7,500,000 acre-feet apportioned to the upper basin and the 8,500,000 acre-feet apportioned to the lower basin—then the upper basin is burdened with furnishing one-half of the water, and these words, I think, should convince the Senator:

> And if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall

be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lees Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d).

Mr. King. I am not quite sure yet, in view of the statement of the Senator. My understanding is that if there should be, as an illustration, 18,000,000 acre-feet in the river, and the upper States should subtract from the stream 7,500,000 acre-feet and there should flow down the difference between 7,500,000 acre-feet

[70]

and 18,000.000 acre-feet, and by treaties Mexico should be allotted 3,000,000 acre-feet, 500,000 acre-feet more than that surplus, then the upper States would be called upon to furnish one-half of that 500,000 acre-feet and the lower States one-half of that 500,000 acre-feet. But suppose Mexico should be allocated only 2,000,000 acre-feet, and that quantity of water was there plus the 7,500,000 acre-feet allocated to the lower basin, then that unappropriated 2,000,000 acre-feet—unappropriated because it is above the 7,500,000 acre-feet—would be taken from the lower basin States and there would be left 7,500,000 acre-feet and the upper States would not be compelled to contribute anything.

Mr. Hayden. I do not so interpret the Colorado River compact. The compact is perfectly clear to me not only because of the specific reference to the 7,500,000 acre-feet apportioned to each basin but also to the additional 1,000,000 acre-feet:

> Such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b).

That is, over and above the 7,500,000 acre-feet plus the 1,000,000 acre-feet, and then in addition thereto, if

it is necessary to furnish water to Mexico, each basin shall share the burden equally.

All that my amendment seeks to accomplish is to follow the same rule that was laid down as between basins, which is an equality of obligation to furnish water to Mexico under any treaty, of which each basin must furnish an equal amount. My amendment seeks to establish the same principle with respect to that part of the water which must be furnished by the lower basin to Mexico by requiring California and Arizona to share that burden equally.

Mr. McKellar. How would they do it under the bill as now proposed?

Mr. Hayden. The bill does not cover the subject at all.

Mr. McKellar. This, then, is an addition to the bill.

Mr. Hayden. Yes; and I want to make that certain. The effect of my amendment would be, if carried out by the tri-State agreement that is contemplated under it, to use round figures, in the event that a million acre-feet of water must be furnished to Mexico under some treaty, 500,000 acre-feet of that amount would be furnished by the upper basin, 250,000 by Arizona and 250,000 by California. Arizona and California would each assume one-quarter of the burden devolving upon the lower basin. I would relieve Nevada from furnishing any water at all, because of the very small amount of water allotted to that State under the tri-State agreement. It seems to me if it is fair to divide the burden between the basins equally, then likewise it is fair to divide the burden equally between Arizona and California.

[71]

Mr. Shortridge. Mr. President——

The Presiding Officer (Mr. Fess in the chair). Does the Senator from Arizona yield to the Senator from California?

Mr. Hayden. Yield.

Mr. Shortridge. The Senator's position is that the States of Arizona and California shall contribute equal amounts quite regardless of whether one or the other has used or needs the water to be delivered to Mexico. Is not that the position of Arizona? So that if that contingency should arise, a treaty having been entered into and a demand having been made upon the United States for a certain quantity of water, California must contribute as much as Arizona contributes.

Mr. Hayden. No more and no less.

Mr. Shortridge. No more and no less, even though California has not the water to deliver, having devoted it to beneficial uses, and Arizona not having devoted its portion to such uses.

Mr. Hayden. In that event, if Arizona had not used her water, of course it would be surplus water and there could be no question about calling upon California for any water. It is only in the contingency that both States are using all of their water, having made valid appropriations of it by applying it to their lands. Then the question comes that there will be a shortage of water in order to supply Mexico under the treaty. Who is going to bear the shortage? It means that certain farm lands in both States will not receive as much water as they otherwise would. In that event Arizona says that California and Arizona should bear that burden equally.

Let me point out to the Senator the other side of the picture. The time when the demand would be made would be during a period of drought. The Senator is well aware that we have long cycles of dry years in the West. The record of a study of the flow of the Colorado River will show that for a period of years by reason of lack of rainfall there is a great reduction in the flow of that stream. For another period of years we may have floods that will greatly increase the average flow of the river. During periods of flood or rainy years Mexico would have all the water she would want, and everybody

else would, too. The pinch comes only during a period of drought. Then by reason of the decreased flow of the river there would not be delivered to Mexico all the water she was entitled to receive under the treaty.

Mr. Shortridge. Mr. President——

The Presiding Officer. Does the Senator from Arizona yield to the Senator from California?

Mr. Hayden. I yield.

[72]

Mr. Shortridge. Taking it as of that condition of affairs and as of that time—Arizona is not then using her water, but California is using her water—does the Senator still think that California should contribute one-half of the waters demanded by Mexico?

Mr. Hayden. If Arizona were not using the water, it would not disappear. It would remain in the channel of the Colorado River and would go down to Mexico, and Mexico would be supplied without any demand upon California at all. If Arizona were not using the water, out of Arizona's share of that water Mexico would be fully supplied. It is only in the contingency that both States are using the full allotment of water provided in the bill, and in that event, if a demand comes from Mexico for water, what is the situation? A period of drought has arrived. Mexico has certain rights to water under a treaty. The water is taken out in the upper basin and in California and Arizona and Nevada, and diverted to such an extent that there does not cross the Mexican border line the quantity of water Mexico has a right to receive. Under the terms of the treaty, the Mexican Government would request of our Government that there be delivered at the boundary whatever shortage existed. Where should that water be obtained? Only in the main stream of the Colorado River.

Mr. Shortridge. May I ask the Senator a further question?

Mr. Hayden. Certainly.

Mr. Shortridge. Does the Senator construe the compact and the proposed amendment to make it necessary for either California or Arizona to discontinue the use of water which it may have put to beneficial use in order to meet the demands of Mexico?

Mr. Hayden. Certainly. A treaty would be the supreme law of the land.

Mr. Shortridge. Certainly.

Mr. Hayden. And if the treaty provided that a certain quantity of water should be delivered to Mexico, the compact contemplates that then and in that event, out of the waters appropriated and used in both States, if there were a shortage, the upper basin would be compelled to let down half of the quantity necessary to supply Mexico. Under my amendment California would furnish one-quarter and Arizona the other quarter until the total quantity was furnished to Mexico, and it would then of necessity deprive land of irrigation water.

Mr. Shortridge. Does not that excite some fear in the mind of the Senator as applied to his own State?

Mr. Hayden. That is exactly what it does; and it was fear which prevented the Legislature of the State of Arizona from ratifying

[73]

the Colorado River compact when first presented to it. The Legislature of the State of Arizona viewed the matter in this light. It was said that by the inclusion of the Gila River and its tributaries in the Colorado River system and then placing upon that system in its entirety the burden of furnishing water to Mexico under any treaty, if Arizona ratifies and approves the compact, she takes on an obligation which may in time to come interfere with the proper irrigation of land now under existing irrigation projects in the Gila River or its tributaries. If anyone does not approve the

compact the only place the water can be obtained from Mexico is out of the main stream of the Colorado River, because, as I have said a number of times to the Senate, this demand would be made during a time of drought, during a time when the tributaries were diminished by reason of a long dry season; and anyone who is acquainted with the Gila River knows that in such a period it is absolutely dry."

Senator Hayden commented on the relationship of the Gila River to Mexico and California as follows (70 Cong. Rec. 464):

"Under the plan contemplated by the Swing-Johnson bill, once it is put into effect, neither the State of California, nor any other State for that matter, would ever obtain any water out of the Gila River. That would be ended. So we in Arizona say that if that is the case, what interest has the State of California in the Gila River? Her wants and needs will be completely supplied by the water impounded at Boulder Dam. The Gila River has never been anything but a menace to the State of California. Senators who are familiar with the facts will remember that the original break in the levee, which inundated a part of the Imperial Valley, was caused by a flood which came down the Gila River. The Gila River broke the levee and the Colorado River entered the break and kept it open. That was what happened. At all times the flash floods of the Gila, which vary tremendously in their volume, are a greater menace to the Imperial irrigation district than the floods of the Colorado River, so far as breaking the levee is concerned.

In addition to that, talk with any farmer in the Imperial Valley, and he will tell you that the muddy, silty flood waters of the Gila River—and that is the only kind they ever get out of that stream—are a positive detriment to their land and they will be most happy

when they can escape from the necessity of accepting any water from the Gila River.

Under the new scheme the Colorado River water will be desilted at Boulder Dam and will come down relieved of a great burden of silt which now fills the canals or is deposited upon the lands of the Imperial Valley farmers.

In fact, under the plan proposed in this bill the State of California, once the Boulder Dam is built and once the

[74]

all-American canal is connected with the Laguna Dam, will have no further interest in the Gila River, and can have none. Whatever water can flow in that stream will be of use not to California but to Mexico and to Mexico alone.

Such being the case, the people living on the Gila River in the State of Arizona feel that they should not have their present rights burdened by any demand that may be made by Mexico. They are willing that the State of Arizona shall assume one-half of the burden of furnishing water to Mexico under any treaty that may be made, notwithstanding the fact that in the main stream, which is the only place where the water can be obtained, Arizona will be allocated but 2,800,000 acre-feet and California 4,400,000, a difference of 1,600,000 acre-feet in favor of California. Yet, notwithstanding the fact that Arizona has 1,600,000 acre-feet of water less than California in the main stream, Arizona will will equally assume the burden. We will pay that price in order that there may be no cloud upon the water rights of the existing irrigation projects on the Gila River."

Senator Johnson obtained the floor to state his views on the Hayden amendment (70 Cong. Rec. 466):

"However that may be, there are certain reasons it seems to me, why the amendment should not be adopted.

The vice of it is, first, in the exemption of the tributaries of the State of Arizona, particularly the one to which he has just adverted, the Gila River, and, secondly, in the endeavor to divide, in the fashion which he says is a perfectly plain and perfectly frank and perfectly open division, the burden that may come to the Colorado River in relation to Mexican lands. He is quite right in one thing. The desideratum that ought to be a desideratum of everybody connected with this bill, whether he represents a State or whether he represents some outside influence, should be entirely the ratification of the Colorado River compact, and anything that will enable us to reach the ratification of that compact that is within reason I am very glad indeed to undertake and very glad indeed to accept.

The argument to me has grown somewhat stale, in relation to every amendment that is presented, that if we would accept that particular amendment then we may at some time in the future accomplish the desideratum that is ours and ratify the Colorado River pact. I need but refer to the very frank statement of the Senator from Arizona (Mr. Ashurst), for which I thanked him yesterday, in that regard, where he said, and said without equivocation in the slightest degree:

> If the Senator from California (Mr. Johnson) beguiles himself into the belief that because of the adoption of this amendment, opposition will relax as to other features of this bill, he is sadly mistaken. The adoption

[75]

> of this water division amendment will by no means remove the thorns and blades of injustice that would yet remain in the bill respecting power and other subjects, and we shall contend to the last, indeed we shall retire into the rocky passes of the Senate rules and there fight until we secure a bill which will, amongst other features, require a 7-state ratification of the so-called Santa Fe—or Colorado River—compact.

That was a statement frankly made by the senior Senator from Arizona yesterday. When upon every amendment it is insisted that if that particular amendment should be adopted we may reach a conclusion and a compromise, I confess, with the eloquence of the Senator from Arizona ringing in my ears, I receive such assurance with a wee bit of skepticism.

Let us see what the Colorado River compact relates to. I read first from the purposes of the Colorado River compact, Article I:

> The major purposes of this compact are to provide for the equitable division and apportionment of the use of the waters of the Colorado River system.

Now, what is the Colorado River system? The Colorado River system then, with meticulous care, is described in the compact in Article II:

> As used in the compact (a) the term 'Colorado River system' means that portion of the Colorado River and its tributaries within the United States of America.

Again, sir, we find in Article III the reference to the Mexican situation, and I read it because I have in my hand at the present time the compact itself. We find in paragraph (c) of Article III the following:

> If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right in the use of any waters of the Colorado River system, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantity specified in paragraphs (a) and (b); and if such surplus shall prove insufficient for this purpose, then, the burden of such deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lees Ferry water to supply one-half of the

deficiency so recognized in addition to that provided in paragraph (d).

We find, therefore, that the compact toward which we are all devoting our efforts in order to get everybody satisfied and to unite in agreeing upon it provides for a division of the

[76]

water of the Colorado River basin, and we find, sir, that in this compact the Colorado River basin embraces not alone the main stream, but embraces the tributaries of the main stream as well.

Sir, the distinguished Senator from Arizona (Mr. Hayden) read remarks that were made in answer to queries of his in writing of Mr. Herbert Hoover, who is to be inaugurated soon as President of the United States. He laid great stress upon Mr. Hoover's ability. He said Mr. Hoover knew more about the Colorado River and its intricacies and all the technical aspects of it than probably any other one man, and read to his purposes, as was his right, certain questions that he had propounded in writing to Mr. Hoover and answers which Mr. Hoover had in writing made to him.

But, Mr. President, in reading the queries that thus the Senator put in writing to Mr. Hoover, and which he says were answered so elaborately, so well, so intelligently, and so accurately, the Senator omitted to read one of the very first of the queries that thus he propounded to President-elect Hoover. This is one of the queries that he then propounded to Mr. Hoover that Mr. Hoover in writing answered to him:

> Question 4. Why was the term 'Colorado River system' used in paragraph (a) of Article III, wherein 7,500,000 acre-feet of water is apportioned to the upper and lower basins respectively?

That is the question propounded in writing by the junior Senator from Arizona to Mr. Herbert Hoover,

who at that time was the president of the Colorado River Commission, and here is the reply that was made by Mr. Hoover to the distinguished Senator from Arizona:

This term is defined in Article II—

I have just read Article II to Senators—

> as covering the entire river and its tributaries in the United States. No other term could be used, as the duty of the commission was to divide all the water of the river. It serves to make it clear that this was what the commission intended to do and prevents any State from contending that, since a certain tributary rises and empties within its boundaries and is therefore not an interstate stream, it may use its waters without reference to the terms of the compact. The plan covers all the waters of the river and all its tributaries, and the term referred to leaves that situation beyond doubt.

What is the Senator asking by this amendment? He is asking, indeed, that we amend the Colorado River compact by the action

[77]

of the Congress of the United States; and then, followed to its logical conclusion, what must occur? Every State must in like fashion take up the amendment of the Colorado River compact, possibly, and thereafter amend it in conformity with this particular amendment.

Mr. Hayden. Mr. President, if the Senator from California will be kind enough to yield, I am sure he does not want to overstate my position. I am not asking that the Colorado River compact be amended in any particular.

Mr. Johnson. I am stating the effect of the Senator's amendment.

Mr. Hayden. I am asking that this effect be secured: That the State of California, which has and will have

no interest in the Gila River, waive any claim to the waters of that stream.

Mr. Johnson. The Senator from Arizona is asking, in effect, sir, that the Colorado River compact be amended. I stand by that statement because it is entirely accurate. That would be the effect of the Senator's amendment if adopted, that the Colorado River compact shall be amended. No one here ought to wish that to be done, and when the definition is made by the compact itself as to what the Colorado River system means, we ought not to be required here to take as a condition precedent to legislation by the Congress of the United States another definition entirely. That in reality and in effect is what is sought by the amendment that is submitted by the Senator from Arizona.

There is, however, another thing in this amendment, too. It sounds well; how fair it is smilingly to say to us, 'Why, we will divide this water into two parts, and each of us will bear a like burden.' It is all well enough to say that the Gila River is this and the Gila River is that; that no water of the Gila River comes down under certain circumstances and too much water comes down under other circumstances; it is all well enough to say when the all-American canal ultimately shall be constructed that that all-American canal will be above where the Gila River runs into the Colorado River and that there will be no occasion for differences at all; all those things may be well enough as matters of speculation; but the fact is, sir, that there comes from the Gila River 3,500,000 acre-feet, all of which is claimed by the State of Arizona—every drop of it. When Arizona says that she has but 2,800,000 acre-feet of water, to that must be added the Gila River with its 3,500,000 acre-feet, and it will then be found that Arizona has in reality two-thirds of the water of the Colorado River itself. If we should exempt, as possibly we may should this amendment be adopted, the Gila River from any burden or any servi-

tude that might thereafter attach because of water to Mexico, we should then exempt a large portion of the water of the stream from bearing its part at all, and say the rest of the stream, owned in equal shares, shall bear the burden equally, so far as California is concerned and so far as Arizona is concerned.

[78]

Mr. Hayden. Mr. President, will the Senator from California yield to me?

Mr. Johnson. I yield.

Mr. Hayden. Taking the statement that there are three and one-half million acre-feet of water in the Gila River in Arizona, if Arizona obtains 2,800,000 acre-feet, from the Colorado the combined sum amounts to 6,300,000 acre-feet. The State of California has allocated to it——

Mr. Johnson. California has allocated to it 4,400,000 acre-feet of water.

Mr. Hayden. It is the Senator's contention that when the time comes to supply water to Mexico the proportion borne by Arizona and California should be in that ratio?

Mr. Johnson. By no means; I am not asking that at all, because we hope by the storage in this dam to control Mexican water; and if the Senator from Arizona will follow the testimony of Mr. Hoover, which he has read to-day, he will find that that is one of the designs; but what I do not wish to do is to exempt the Gila River at this time and put the whole burden upon the two States subsequently in the proportion the Senator has indicated.

Mr. Hayden. The Senator is unwilling that California should divide the burden equally with the State of Arizona?

Mr. Johnson. Not a bit; but there would not be an equal division under the system the Senator proposes. It is a division, on the one hand, by which it is pro-

posed to exempt from the stream, first, 3,500,000 acre-feet—and sometimes the people of Arizona have said that there were 6,000,000 acre-feet in that stream, as the Senator is well aware, but taking the lower figure, 3,500,000 acre-feet—the Senator is seeking to deduct that first and then have a division made of the waters that are in the main stream itself.

There is not any necessity for any action in this regard at all. It is an uncertain thing to do to-day; it is a thing from which no man can tell what the consequences may be; and it ought not to be done. Particularly, it ought not to be done in view of the definitions that are found in the Colorado River compact, and which I have read here. Sufficient it is, for us to accomplish that purpose subsequently when the dam shall have been erected. Into this bill write, if you desire, any notice to Mexico that you wish—and I want no water to go down there in excess of that which any law permits Mexico to have to-day—do anything in regard to international comity that you desire, but do not write into this measure in this fashion an exemption which would destroy in one aspect, the definitions that are contained in the Colorado River compact and would put an additional

[79]

burden on the waters that are to bear the burden of Mexico. That is unjust and unfair from our standpoint.

Mr. Hayden. Mr. President, if the Senator will yield to me, I want to find out what he thinks is just and fair.

Mr. Johnson. I think it is just to do nothing in relation to that portion of this amendment. It has no place in this bill at all. What are the reasons why the Senator wants this amendment?

Mr. Hayden. The reason I want this amendment is that I may say to the people of Arizona that the State

of California has agreed with them to furnish one-half of any water that may be demanded by Mexico.

Mr. Johnson. But the Senator does not say anything of the kind in the amendment. He says after exempting the tributaries in the State of Arizona that then the State of California agrees out of the main stream to bear one-half of the burden.

Mr. Hayden. Would the Senator be willing to have incorporated in this bill the simple proposition that California shall accept one-half of that burden?

Mr. Johnson. I do not want anything to interfere with the compact.

Mr. Hayden. There would be no interference with the compact. The compact provides for an equal division.

Mr. Johnson. No; I am speaking as to the exemption of the tributaries in Arizona. Let them alone; let the situation remain as it is. We will bargain with Arizona ultimately or agree with her ultimately, as the case may be, but this is neither the time nor the place to alter the compact that is now the desideratum of everybody connected with this enterprise.

Mr. Hayden. If the Senator will permit me to say so, I am not seeking in any manner to interfere with the compact. The only effect that the compact can have upon his State is that that State will be bound to furnish one-half of the water which Mexico may receive under any treaty. Beyond that the State of California has no interest in the matter."

Senator Pittman expressed his views on the Hayden amendment and offered two changes: (1) To strike the preamble requiring California to agree to a tri-state compact, and (2) To add a seventh provision dealing with the effective date of the tri-state compact, as follows (70 Cong. Rec. 468):

"Mr. Pittman. Mr. President, the Senate is apt to forget that

any States are interested in this legislation except the States of Arizona and California. As a matter of fact, one of the reasons that started this whole compact was the realization of four States in the upper Colorado River that unless this impounding of water at Boulder Dam was regulated, when they got ready to use the water of the Colorado River in the future there would not be any; it would all be appropriated in the lower basin. Consequently, we started out in 1921, with the aid of Congress, which authorized the seven Colorado River States to try to agree on the distribution of water and the terms upon which it would be used.

Now we come down to this proposition:

The Senate has already determined upon the division of water between those States. How? It has been determined how much water California may use, and the rest of it is subject to use by Nevada and Arizona. Nevada has already admitted that it can use only an insignificant quantity, 300,000 acre-feet. That leaves the rest of it to Arizona. As the bill now stands it is just as much divided as if they had mentioned Arizona and Nevada and the amounts they are to get; but there is just one other phase to the matter. The amount that either one of those States is entitled to under this legislation may be reduced if at some future time it is agreed, by treaty or contract or otherwise, that a certain amount of this water should, in justice, be used in Mexico.

Presently, as I have said before, I think the amount that can be used in Mexico is insignificant. I think, also, that under the comity that exists between nations the only water that Mexico could claim would be water that she has appropriated from the natural flow of the stream, and that she could claim none of the benefits of the water increased by our own impounding works. That, however, is not the question. The question is one of satisfying the States.

Why should we satisfy the States? Because if you do not satisfy a State as to the exact thing that is going to happen to it under legislation, it will oppose the legislation.

As a matter of fact and as a matter of law, I do not believe that the Gila River is in any danger whatever from any demands for water in Mexico for two reasons: In the first place, there is bound to be enough overflow or return flow to satisfy that demand. In the second place, the Congress of the United States has no constitutional authority through the passage of any act to take away a vested water right. If the people of Arizona on the Gila River have put to beneficial use the water of that stream—and they claim that they have—then there is no power in Congress to take it away from them, nor would there be any power by treaty to take it away from them. A treaty certainly is nothing more than a statute and in my opinion we could not make a treaty that would violate the Constitution of the United States any more than we could a statute. That, however, is not the question. The question is, Are we going to reach a settlement

[81]

with Arizona?

A majority of the people of Arizona believe that there is danger of their vested rights in water, of the water that they are actually using, being taken in part to supply Mexican demands. As I have said before, I do not think there is any ground for that belief; but if that is the belief of the majority of the Legislature of the State of Arizona and their governor, then we have, if possible, to remove their fear before we can get their ratification.

Do we want their ratification? Is their ratification necessary to this legislation? I think it is. Why?

This bill provides that no construction shall take place—nothing shall be done until six of the seven States, including California, ratify. Where are we

going to get the States to ratify? We had six States that ratified the 7-State agreement; but since that ratification the Legislature of Utah has solemnly annulled its ratification. Now we stand in the position that there are no six States in the humor at the present time to ratify. Utah has refused to ratify the agreement and is out of it. Arizona has refused to ratify it. We must get one of those States to ratify in order ever to work under the bill if we pass it—one of them. We must either get Utah back or we must get Arizona.

As a matter of fact, there have been rumblings in the State of Colorado against the safety of a 6-State compact. Personally, I do not agree with them. I do not think there is any ground for any fear. I think the 6-State compact protects the upper basin; but there is a fear there, nevertheless, and a fear expressed by some very able lawyers in Colorado.

Colorado might pull out of a 6-State compact. It would be a splendid consummation if we could get all seven States to agree with regard to this whole legislation.

Let us see what we are up against. There is no question but that we have settled satisfactorily to all States the water question. Now we have gotten down to the question of liability to Mexico, which, while to my mind it amounts to nothing, arouses a great deal of fear in the minds of some people in Arizona.

Admitting that all of the water of the Gila is now being put to use, except the return flow—and in this amendment the return flow is subject to the demands of Mexico—if it is all put to use, as a legal matter, that can never be disturbed. The Senator says, 'Why mention it if it can never be disturbed?' There is only one reason I know of and that is to overcome the fears of the people who do not believe as I do, that the fears are groundless.

Our engineer in Nevada, Mr. Malone, agrees with Mr. La Rue

with regard to the return flow of the river. At the present time it is at least five or six hundred thousand acre-feet. It will undoubtedly be increased greatly with further irrigation from the Colorado River water. The Department of the Interior has estimated that there never can be, from the waters of the Colorado, over three or four hundred thousand acres irrigated, and that not by subsurface pumping but by diversion. There is such a limit on it.

As I understand this amendment, Arizona to-day has practically allocated to it 2,800,000 acre-feet of water in the main Colorado River. It is there for their use. As I understand it, they are willing to give up any amount that may be necessary to meet the demands of Mexico from that 2,800,000 acre-feet, provided it is matched by an equal amount of water out of California's allocation of 4,400,000 acre-feet.

In the circumstances, I am exceedingly anxious to bring about a condition that will cause the Legislature of Arizona to ratify the 7-State agreement. I am afraid if we do not make that possible, we may go on trying to get a 6-State agreement for a year or so and maybe find we will have to come back here and try to get legislation for a 5-State agreement or something else.

I would not ask of California to bear any additional burden over what Arizona bears. I can not see that it does. I can not see that there is any danger. But there is one thing in this amendment—and I want the attention of the Senator from Arizona to this—which I do not like. I do not like the form of it. I do not like the method of getting at it. It provides:

> The said ratifying act shall further provide that if by tri-State agreement hereafter entered into by the States of California, Nevada and Arizona the foregoing limitations are accepted and approved as

fixing the apportionment of water to California, then California shall and will therein agree.

That does not seem to be the regular form of entering into an agreement, to have California first proceed to limit herself as to what she will do as consideration for the passage of this measure. I think it should be a mutual agreement between the three States. I do not think we should bind up this tri-State agreement with ratification. I did believe that it was essential to have California limit herself as to the amount of water she would take in a ratification, in view of the fact that possibly Arizona would never ratify. But this is attempting to have the State of California in advance, as a condition of the taking effect of this measure, state that she will enter into certain agreements with Arizona. In other words, it is coercive.

Mr. Hayden. Is it any greater coercion, if the Senator will permit me, than for the State of California to insist that, as a condition to her ratification of the main contract, Congress

[83]

shall do certain things, to wit, provide storage to the extent of 20,000,000 acre-feet of water in the main stream.

Mr. Pittman. I do not consider that coercion.

Mr. Johnson. It was impossible to hear what the Senator from Arizona said. All I heard was, 'the State of California.'

Mr. Hayden. I withdraw the remark, because I do not want to have any remark I might make misinterpreted.

Mr. Pittman. I do not think that the demand on the part of California that there should be a storage of at least 20,000,000 acre-feet of water is coercion. I think it is essential, as shown by the report of the commission. A demand for what is essential is not coercion.

This is what I suggest, that we provide for an agreement between the three States, and let them enter into it if they want to, but if they do not want to, let them stay out of it. That is not coercing a State.

This is what I propose, to strike out all of the Hayden amendment down to and including the word 'agree' on page 1, in line 6, and in lieu thereof insert the following:

> The States of Arizona, California, and Nevada are authorized to enter into an agreement, which shall provide.

Then go ahead and put down the provisions of the Hayden amendment, and at the end of the Hayden amendment put in a seventh paragraph, which shall read:

> Said agreement to take effect upon the ratification of the Colorado River compact by Arizona, California and Nevada.

The Constitution requires that before States may enter into an agreement they shall be authorized by Congress to enter into the agreement. I start out by having Congress, by this act, authorize an agreement. I make the agreement specific by reason of the fact that otherwise it might be held that they would have to come back to Congress for approval of the agreement they entered into. They approve a specific agreement in advance and authorize it. The terms are set out. It does not take effect unless all three States ratify the Colorado River compact.

Mr. Hayden. It should not.

Mr. Pittman. It should not. It does not require California to enter into that agreement. It does not require Arizona to enter into that agreement. It does not require Nevada to enter into that

agreement. If they do not enter into that agreement, then we have the bill as it stands. Whatever States

do not ratify are not bound by this measure. That, then, becomes an optional matter and not a coercive matter.

I am confident, however, that if the State of Arizona were willing to enter into such an agreement she would, of course, ratify the Colorado River compact, and if she were not willing to ratify the Colorado River compact she would not want California bound by these conditions, because she would not be in the 7-State compact, and would have nothing to do with it.

Therefore I say that the fair and practical way is to set out the terms of an agreement which the Congress of the United States would be satisfied for the States to enter into, and say that if they see fit to enter into it they may, but it shall not become effective as a subsidiary agreement to the main 7-State compact until those three States do ratify the 7-State compact.

I offer that as a suggestion. I do not want to interfere with the vote on this amendment, but I would like very much to have it in a voluntary agreement, rather than impose it upon California as a condition of the ratification.

Mr. Hayden. Mr. President, I am not at all insistent that my amendment be adopted in the exact language in which it is offered. The suggestion made by the Senator from Nevada is entirely satisfactory to me.

Mr. Pittman. Then I offer it.

The Presiding Officer. The amendment would be an amendment in the third degree, and it would not be in order.

Mr. Hayden. Have I the privilege of perfecting my amendment so as to carry out the suggestion of the Senator from Nevada?

The Presiding Officer. The Senator can do that.

Mr. Hayden. Then I am pleased to do that."

Senator Pittman continued his comments (70 Cong. Rec. 471):

"Mr. Pittman. Mr. President, this question has been here now for seven years. The seven States have been attempting to reach an agreement. Apparently the Senate of the United States is about to reach an agreement as to what ought to be done. The Senate has already stated exactly what it thinks about the water. That might have been an imposition on some States. Why do we not leave it to California to say how much water she shall take out of the river or leave it to Arizona to say how much water she shall take out of the river? It is because it happens to become a duty of the United States Senate to settle this matter, and that is the reason.

[85]

Has the State of California or Arizona or Nevada asked for any different kind of an agreement than the one that is here? Does the State of New Mexico desire that there should be a different agreement between California, Arizona and Nevada than the one that has been suggested? If so make another suggestion. Why be so fearful with regard to the imposition upon Nevada, Arizona and California when the representatives of neither one of those States so far have got up here and raised such an objection? California has not asked for any particular form of agreement between the States; Nevada has not asked for any particular form of agreement between the States; Arizona has not asked for any particular form of agreement between the States. Arizona, however, has stated that unless certain things are agreed to by California this bill shall not go into effect. I objected to that. I do not think that California alone should be made to agree to anything. I think, however, that if we have in mind a certain agreement that might be entered into by the three of them, if something better shall be submitted we ourselves ought to submit it. That is all that is happening here.

We have already decided as to the division of the water, and we say that if the States wish they can enter into a subsidiary agreement confirming that. We have already agreed that the 7-State pact shall be binding."

Senator Johnson voiced his feelings (70 Cong. Rec. 471):

"Mr. Johnson. Here is the difficulty which strikes me in the matter: First of all, we are authorizing the doing of something that already the States have the right to do. Secondly, we are stating the things that the three States are to do, and we are making a sort of Procrustean bed upon which they must lie in the determination of matters that are suggested within this amendment, without any elasticity, without any opportunity to alter phraseology or possibly terms. What is done by the amendment is to put the impress of the Federal Government upon the necessity of agreement, and, if one of the States should not agree, leave that State in a position which would not be particularly enviable.

With the distinct understanding that this authorization is one that is after all an authorization that is wholly unnecessary, because the parties may, in any fashion they desire, meet together and contract and subsequently come to Congress for ratification of that contract; that there is no impress of the Congress upon the terms, which might be considered coercive to any one of those States, I am perfectly willing to accept the amendment.

Mr. Pittman. There is nothing necessary at all, of course, so far as the adoption of this amendment is concerned, unless the element of time is considered valuable. If it should happen, mind you, that two weeks from now the legislatures of the three States,

being in session, should be perfectly satisfied with the terms of this proposed agreement and should ratify

it, they could on the next day also ratify the 7-State agreement. On the other hand, if we do not adopt this amendment now, but allow the three States to meet together and agree and they should agree, then it will be necessary for them to come to Congress next fall; and we might find that Congress next fall would not ratify the agreement entered into by the three States, might we not?

Mr. Johnson. That is possible.

Mr. Pittman. Suppose, for instance, a majority of the Senate found there were certain things in the agreement it did not like.

Mr. Johnson. That is all right; but what I want to make clear is that this amendment shall not be construed hereafter by any of the parties to it or any of the States as being the expression of the will or the demand or the request of the Congress of the United States.

Mr. Pittman. Exactly, not.

Mr. Johnson. Very well, then.

Mr. Pittman. It is not the request of Congress.

Mr. Johnson. I accept the amendment then."

The Vice President then put the question on the Hayden amendment (as modified by the Pittman suggestions) to the Phipps amendment to Sec. 4(a) of the Johnson substitute bill and it was adopted without a roll call (70 Cong. Rec. 472).

The Phipps amendment to the Johnson substitute was approved without roll call (70 Cong. Rec. 473).

(Note: The Phipps amendment at all stages dealt not only with Sec. 4(a) but also included the provision in Sec. 5 that all contracts executed by the Secretary "shall conform to paragraph (a) of section 4 of this Act".)

On December 14, 1928, H. R. 5773 as amended was approved by the Senate.

The House concurred in the Senate Amendment (70 Cong. Rec. 837-38) without further change.

[87]

Section 8

The evolution of Sec. 8 of the Project Act commenced with H. R. 6251 (69th Congress, 1st Session). This section as introduced read:

"SEC. 8. (a) That the United States, in managing and operating the dam, canals, and other works herein authorized, including the delivery of water for the generation of power, irrigation, or other uses, shall observe and be subject to and controlled by the Colorado River Compact[1] as signed at Sante Fe, New Mexico, on November 24, 1922, and particularly described in section 13 herein.

(b) Also all rights of the United States in or to waters of the Colorado River, howsoever acquired, as well as the rights hereafter arising of those claiming under the United States, shall be subject to and controlled by said compact.

(c) Also all patents, grants, contracts, concessions, leases, permits, licenses, rights of way, or other privileges from the United States or under its authority, necessary or convenient for the use of waters of the Colorado River, or for the generation or transmission of hydroelectric power generated by means of the waters of said river, shall be upon the express condition and with the express covenant that the rights of the recipients or holders thereof to waters of the river, for the use of which the same is necessary, convenient, or incidental, shall likewise be subject to and controlled by said compact.

(d) The conditions and covenants referred to herein shall be deemed to run with the land and water right, and shall attach as a matter of law, whether set out or referred to in the instrument evidencing any such patent, grant, contract, concession, lease, permit,

license, right-of way, or other privilege from the United States or under its authority, or not, and shall be deemed to be for the benefit of and be available to the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, and the users of water thereunder, by way of defense or otherwise, in any litigation respecting the waters of the Colorado River."

In the hearings on H. R. 6251 before the House Committee on Irrigation and Reclamation, (69th Congress, 1st Session), at p. 39, Charles P. Squires, a witness from Nevada suggested an addition to the then language of Sec. 8(a) as follows:

"I would respectfully suggest to your committee that a clause be added to the committee print bill now under consideration,

[88]

directing that the Secretary of the Interior, in the allocation of rights, shall make such allocation in accordance with the terms of a compact now in process of negotiation between the States of Arizona, California, and Nevada, provided such a compact shall be negotiated and ratified by the legislatures of said three States and consent thereto be given by Congress on or before March 4, 1927.

Such a clause, permitting Arizona, California, and Nevada to proceed with the orderly and peaceful solution of their own problems, but leaving the Secretary of the Interior free to act under the terms of the bill as now drawn in case no agreement is arrived at, may be added, substantially as follows:

Page 9, section 8(a), line 7, add, following the word 'herein':

and by the terms of a compact between the States of Arizona, California, and Nevada for the division of the benefits accruing to said three States, under

said Colorado River compact, provided such a compact between said three States shall be negotiated and ratified by the legislatures thereof and consent thereto be given by Congress on or before March 4, 1927.

Mr. Hayden. You are a member of the commission that is negotiating the compact between the three States of the lower basin?

Mr. Squires. Yes, sir.

Mr. Hayden. When do you expect to have your next meeting?

Mr. Squires. It has been my hope to have one very soon. When I left Nevada some of the members of the California commission were absent, and prior to that some members of the Arizona commission had been absent from the State. I anticipate that we will have a meeting very soon.

Mr. Hayden. Do you sincerely believe that the representatives of the three States can reach an agreement with respect to an apportionment of water and other matters of difference between them?

Mr. Squires. I sincerely do.

Mr. Hayden. Is that opinion based upon meetings that have been held and your information as to the general situation?

Mr. Squires. Yes, it is.

Mr. Hayden. I believe you stated that Nevada wanted an assurance of sufficient water for her land, and would be satisfied with about 300,000 acre-feet.

[89]

Mr. Squires. Yes, sir; probably not quite that. We don't know just what it will amount to, but that will be ample. That figure was suggested by the California and Arizona commissions in these sessions we had.

Mr. Hayden. Are you satisfied that 300,000 acre-feet will fully take care of all of the needs of the State of Nevada?

Mr. Squires. I am satisfied that it will be ample.

Mr. Hayden. What is the proposed division of the water?

Mr. Squires. The unconsumed portion would run back and flow down the stream and then divide between the other States.

Mr. Hayden. Between California and Arizona?

Mr. Squires. Yes, sir.

Mr. Hayden. After Nevada has been cared for?

Mr. Squires. Yes, sir.

Mr. Hayden. Upon what basis?

Mr. Squires. Upon such basis as the States agree upon.

Mr. Hayden. Has there been any tentative division of the waters between the two States?

Mr. Squires. There have been some proposals back and forth, which have not been mutually satisfactory, but which have shown rather a tendency toward coming to an agreement, I think."

Mr. Squires proposal was not then accepted by the committee.

On February 27, 1926 Mr. Swing introduced H. R. 9826, as a substitute for H. R. 6251, without change in Sec. 8. On the same date S. 3331 was introduced in the Senate and Sec. 8 was the same as in H. R. 9826 and as originally proposed in H. R. 6251, *supra*.

The committee print of April 10, 1926 (at p. 93 Hearings before House Committee on Irrigation and Reclamation) deleted Sec. 8 (a) and (b) and (at pp. 93 and 94 of the reported hearings) substituted the following:

"SEC. 8(a) The United States, its permittees, licensees, and

[90]

contractees, and all users and appropriators of water stored, diverted, carried, and/or distributed by the reservoir, canals, and other works herein authorized,

shall observe and be subject to and controlled by said Colorado River compact and the terms of such compact, if any, between the States of Arizona, California, and Nevada, for the equitable division of the benefits, including power, arising from the use of water accruing to said States, subsidiary to and consistent with said Colorado River compact, which may be negotiated and approved by said States and to which Congress shall give its consent and approval on or before March 4, 1927; and the terms of any such compact concluded between said States and approved and consented to by Congress after said date: Provided, That in the latter case such compact shall be subject to all contracts, if any, made by the Secretary of the Interior under section 5 hereof prior to the date of such approval and consent by Congress in the construction, management, and operation of said reservoir, canals and other works and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other purposes, anything in this act to the contrary notwithstanding, and all permits, licenses, and contracts shall so provide.

(b) The rights of the United States in or to waters of the Colorado River and its tributaries howsoever claimed or acquired, as well as the rights of those claiming under the United States, shall be subject to and controlled by said the Colorado River compact."

A second committee print of April 14, 1926 contained several amendments to Sec. 8, including the Nevada proposal which appeared as subsection (d). The new section appears at pp. 117 and 118 of the printed committee hearings:

"SEC. 8(a) All appropriations of water from the Colorado River, incident to or resulting from the construction, use, and operation of the works herein authorized, shall be made and perfected in and in con-

formity with the laws of only those states which may or shall have approved the Colorado River compact ratified in section 12 of this Act.

(b) The place of application to use of the waters impounded, discharged, delivered, or carried by the works or structures herein authorized, whether for domestic, irrigation, generation of power, or for other beneficial purposes, and whether the use be by the United States or by others shall be confined in each and every instance to the States that shall have approved said Colorado River compact, and nothing herein contained shall be construed to interfere with the State control of the use of water in any of said States, but present users of water in any nonapproving State shall not be affected by the requirements of

[91]

this paragraph.

(c) The United States, its permittees, licensees, and contractees, and all users and appropriators of water stored, diverted, carried and/or distributed by the reservoir, canals, and other works herein authorized, shall observe and be subject to and controlled by said Colorado River compact in the construction, management, and operation of said reservoir, canals, and other works and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other purposes, anything in this Act to the contrary notwithstanding, and all permits, licenses, and contracts shall so provide.

(d) Also the United States, in constructing, managing, and operating the dam, reservoir, canals, and other works herein authorized, including the appropriation, delivery and use of water for the generation of power, irrigation, or other uses, and all users of water thus delivered and all users and appropriators of waters stored by said reservoir and/or carried by said canal,

including all permittees and licensees of the United States or any of its agencies, shall observe and be subject to and controlled, anything to the contrary herein notwithstanding, by the terms of such compact, if any, between the States of Arizona, California, and Nevada, for the equitable division of the benefits including power, arising from the use of water accruing to said States, subsidiary to and consistent with said Colorado River compact, which may be negotiated and approved by said States and to which Congress shall give its consent and approval on or before March 4, 1927; and the terms of any such compact concluded between said States and approved and consented to by Congress after said dates; Provided, That in the latter case such compact shall be subject to all contracts—if any, made by the Secretary of the Interior under section 5 hereof prior to the date of such approval and consent by Congress.

(e) Nothing in this Act shall be deemed to waive any of the rights or powers reserved or granted to the United States by paragraph 7 of section 20 of the Act providing for the admission of Arizona, approved June 20, 1910, and by the 10th paragraph of Article XX of the constitution of Arizona, but the Secretary of the Interior is authorized on behalf of the United States to exercise such of said rights and powers as may be necessary or convenient for the construction and use of the works herein authorized and for carrying out the purposes of this Act."

Mr. Delph Carpenter, a witness from Colorado commented on the proposal for a lower basin compact at pp. 202 and 203 (House Committee Hearings):

"SECTION (d) is proposed by Nevada, which State makes a proposal, I might observe out of consideration for the protection of the three lower States—in the recognition of any compact that may

hereinafter be entered into between them respecting the use and disposition of the Colorado River water allocated by the Colorado River compact. On the phraseology of this amendment we have no comment. That is more a matter for the proponents of the amendment. We do, however, heartily join in the request of Nevada that this or some such provision be put in this bill, because it was the thought of the framers of the Colorado River compact that the water allocated to the lower basin would be ultimately apportioned between the three States of the lower basin by separate subsidiary compacts concluded between them. The suggestion has recently been made that the upper States should have joined in an apportionment of the lower basin water between the lower States. The upper basin States refrained from considering any such proposition because it became very evident at the outset that the problems of the Colorado River, because of the climatology and geography, and all other natural features controlling the water of that river, irrespective of the will of man and the works he might create—all those features divided the river into two natural basins, in which the natural features were to be contrasted rather than compared.

Therefore it would be very presumptuous for the upper States to have stepped in and tried to force a local apportionment between the three lower States. The negotiations now proceeding, or which recently proceeded, between Nevada, Arizona, and California, are in harmony with the intent of the compact and should be encouraged; and anybody who attempts to interfere with those negotiations should be discouraged in such effort."

and at page 204 of the Hearings:

"Mr. Hayden. I desire to inquire as to the desirability of fixing a time limit, such as March 4, 1927, within which the State of Arizona must agree.

Mr. Carpenter. I have been fearful that the section would be misconstrued in the very manner that you suggest. I think it is the intent of the framers of the amendment that the compact when entered into and approved by Congress should be controlling upon the works herein authorized, but they wish to fix a reasonable time within which to arrive at a compact to deal with the waters with perfect freedom, knowing that if the Secretary of the Interior enters into contracts for disposition of water and power to be generated, that any compact between the three States would confront those contracts, and the three lower States might be put in a position of recognizing those contracts irrespective of their effect upon any one State. It was the thought of the framers of the amendment to stay the hand of the Secretary of the Interior in any such contracts for such a time as may be necessary for the three lower States to conclude a compact. That is the reason for inclusion of the date."

SEC. 8 was reported out of committee without further change,

[93]

except the deletion of subsection (b). Section 8 of S. 3331 went through similar changes before the Senate committee and was reported out in the same form.

On the Senate floor, Senators Pittman of Nevada (Feb. 22, 1927) and Ashurst of Arizona (Feb. 25, 1927) each proposed an amendment to Sec. 8 of the committee version of S. 3331 which would give to their two states a share of the energy generated at Boulder Canyon in the event the compact provided for was not entered into by Arizona, California and Nevada. This suggestion was again made in the 70th Congress but was not adopted.

Mr. Swing introduced H. R. 5773 in the 70th Congress. SEC. 8 provided:

"SEC. 8(a) All appropriations of water from the Colorado River, incident to or resulting from the construction, use, and operation of the works herein authorized, shall be made and perfected in and in conformity with the laws of those States which may or shall have approved the Colorado River compact ratified in section 12 of this Act.

(b) The United States, its permittees, licensees, and contractees, and all users and appropriators of water stored, diverted, carried, and/or distributed by the reservoir, canals, and other works herein authorized, shall observe and be subject to and controlled by said Colorado River compact in the construction, management, and operation of said reservoir, canals, and other works and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other purposes, anything in this Act to the contrary notwithstanding, and all permits, licenses, and contracts shall so provide.

(c) Also the United States, in constructing, managing, and operating the dam, reservoir, canals, and other works herein authorized, including the appropriation, delivery, and use of water for the generation of power, irrigation, or other uses, and all users of water thus delivered and all users and appropriators of waters stored by said reservoir and/or carried by said canal, including all permittees and licensees of the United States or any of its agencies, shall observe and be subject to and controlled, anything to the contrary herein notwithstanding, by the terms of such compact, if any, between the States of Arizona, California, and Nevada, for the equitable division of the benefits, including power, arising from the use of water accruing to said States,

[94]

subsidiary to and consistent with said Colorado River compact, which may be negotiated and approved by

said States and to which Congress shall give its consent and approval on or before June 1, 1928; and the terms of any such compact concluded between said States and approved and consented to by Congress after said date: *Provided,* That in the latter case such compact shall be subject to all contracts, if any, made by the Secretary of the Interior under section 5 hereof prior to the date of such approval and consent by Congress.

(d) Nothing in this Act shall be deemed to waive any of the rights or powers reserved or granted to the United States by paragraph 7 of section 20 of the Act providing for the admission of Arizona, approved June 20, 1910, and by the tenth paragraph of Article XX of the constitution of Arizona, but the Secretary of the Interior is authorized on behalf of the United States to exercise such of said rights and powers as may be necessary or convenient for the construction and use of the works herein authorized and for carrying out the purposes of this Act."

S. 728 was introduced by Senator Johnson and Sec. 8 was similar except for a reservation of power rights for Arizona and Nevada, which reservation was deleted by the Senate Committee on Irrigation and Reclamation (See S. Rep. No. 592, 70th Congress, 1st Session 3).

Both the House (69 Cong. Rec. 9984) and Senate (S. Rep. No. 592, *supra* at 3) Committees amended Sec. 8(c) to provide for a compact between Arizona, California and Nevada "or any two thereof" and to change the pertinent date from "June 1, 1928" to "January 1, 1929". In addition the Senate deleted Sec. 8(a) in committee (S. Rep. No. 592, *supra* at 3) and Sec. 8(d) (70 Cong. Rec. 586-92), thereby perfecting the present language of Sec. 8 of the Boulder Canyon Project Act.

[95]

PROPOSAL BY CALIFORNIA AND NEVADA FOR A LOWER BASIN COMPACT (DECEMBER, 1925)*

The States of Arizona, California, and Nevada by their proper authorities have appointed representatives for the purpose of negotiating a compact between said States in reference to the use of the waters of the Colorado River, and after negotiations between said respective representatives they have agreed upon the following articles:

ART. I. The purposes of this compact are to provide for the equitable division and apportionment of the use and benefits of the waters of the Colorado River; to establish the relative importance of different beneficial uses of said water; to promote interstate comity; to remove causes of future controversies; to bring about the effectiveness of the Colorado River compact; and to secure the development of the Colorado River.

ART. II. As used in this compact (a) the term "Colorado River" means the main stream of the Colorado River at and below Lee Ferry, together with any and all tributaries within any of the signatory States entering said river below Lee Ferry, except the Gila River and its tributaries, the Williams River and its tributaries, the Little Colorado River and its tributaries, and the Virgin River and its tributaries; the mouth of each said rivers above excepted shall be deemed to be the highest point to which the flood or back waters from the Colorado River may extend, whether caused by artificial means or otherwise.

(b) The term "Colorado River compact" means that certain instrument or compact respecting the Colorado River signed by the commissioners from the States of

* The text is copied from the Hearings before the Senate Committee on Irrigation and Reclamation on S. Res. 320 (68th Congress, 2d Session), pp. 626-28.

Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, and approved by Herbert Hoover, as representative of the United States of America, at Santa Fe, N. Mex., November 24, 1922.

(c) The term "operative horsepower" shall be understood to mean the average for the year at the plant switchboard of the daily maximum generated horsepower that is sustained continuously for a period of 90 minutes.

(d) All other terms, words, phrases, or expressions used in this compact shall be understood to be used in the same sense and with the same meaning as used in the Colorado River compact hereinabove defined.

ART. III. (a) The States of California and Nevada hereby release to the State of Arizona any and all claims of every kind or nature to

[96]

the use of the waters of the Gila River, the Williams River, and the Little Colorado River, and all of their respective tributaries, for agricultural and domestic use, and the States of Arizona and California hereby release to the State of Nevada any and all claims of every kind or nature to the use of the waters of the Virgin River and all of its tributaries for agricultural and domestic use, in consideration of which there is hereby allocated from the waters of the Colorado River to the State of California 1,095,000 acre-feet of water per annum in perpetuity for beneficial consumptive use.

(b) There is hereby allocated to the State of Nevada such waters of the Colorado River as can be put to beneficial use within the State not exceeding 300,000 acre-feet of water per annum for beneficial consumptive use in perpetuity.

(c) There is hereby allocated from waters of the Colorado River to the State of Arizona its present perfected

rights to the beneficial consumptive use of 232,000 acre-feet of water per annum in perpetuity.

(d) There is hereby allocated from the waters of the Colorado River to the State of California its present perfected rights, in addition to all other allocations, the beneficial consumptive use of 2,146,600 acre-feet of water per annum in perpetuity.

(e) The use of waters of the Colorado River not otherwise hereinabove expressly allocated is hereby allocated in equal shares to the States of Arizona and California, it being the intention of the signatory States, subject to the terms of the Colorado River compact, to divide for use in said States all of the waters of the Colorado River: *Provided,* That any water allocated by this paragraph (e) but not actually applied to agricultural or domestic use by January 1, 1975, shall thereafter, notwithstanding the foregoing allocation, be subject to appropriation for use in either Arizona or California.

ART. IV. It is the intention of the signatory States to so divide the waters of the Colorado River as to provide for the maximum thereof within said States, and notwithstanding the foregoing allocations no State shall withhold water and no State shall require the delivery of water which can not reasonably and beneficially be applied to agricultural or domestic use within said State.

ART. V. The chief official of each signatory State charged with administration of water rights, together with the Commissioner of Reclamation of the United States, shall cooperate ex officio to promote the systematic determination and coordination of the facts as to flow, appropriation, consumption, and use of water from the Colorado River and the interchange of available information on such matters.

ART. VI. That in the event the United States of America shall construct a dam in the main stream of the Colorado

River at or near Boulder Canyon, creating a reservoir of not less than 20,000,000 acre-feet of water, at which hydro-electric power shall be generated by persons or agencies other than the United States of America, then such persons or agencies

[97]

generating such power at said dam shall each pay to the Secretary of the Interior $1. per annum, for each operative horsepower which may be installed by him or for his or its benefits, in addition to any and all other requirements by the United States, which said sums so paid shall be paid by the Secretary of the Interior to the States of Arizona and Nevada in equal parts annually, said payments to be made at such times and under such reasonable regulations and in such installments as the Secretary of the Interior may by general order prescribe. No payment under this article shall be required until power-generating machinery upon which said payment is based shall have been placed in actual operation. The provisions of this article shall not be construed as affecting or intending to affect the taxing power of any of the signatory States, but that in the event any of such persons or agencies generating power at said dam shall pay any tax, assessment, impost, or other liability, demand or charge upon said power or works therefor, under the taxing power of the State or subdivision thereof, then and in that event, for the year immediately following such payment, the amount of money so paid shall be deducted from the amount to be paid to the Secretary of the Interior as hereinabove in this article provided for the benefit of the State to whom such payment was made. The payment of said sums to the said Secretary of the Interior for the benefit of Arizona or Nevada shall be in lieu of all license or other fees now or which may hereafter be required by the said States or either of them for the use, license, or privilege of storing water, or building and operating generating plants, transmission lines or otherwise, in connection with the said dam.

ART. VII. Should any claim or controversy arise between any two or more of the signatory States over the meaning or performance of any of the terms of this compact, then upon the request of the governor of any one or more of the signatory States it shall be the duty of the governors of the signatory States to appoint a commission with power to consider and adjust such claim or controversy, subject to ratification by the legislatures of the States affected and by the Congress of the United States.

Nothing herein contained, however, shall prevent the adjustment of any such claims or controversies by any then present method or by direct legislative action of the interested States, with the approval of the Congress of the United States.

ART. VIII. In the event this compact should at any time be terminated by unanimous agreement of the signatory States, all rights established under it shall nevertheless continue unimpaired.

ART. IX. The provisions of this compact have reference to the use of the waters of the Colorado River for agricultural and domestic use only and have no reference to the use of said waters for the generation of electric power except that the use of said waters for the generation of electric power shall forever be and remain subordinate to the use thereof for agricultural and domestic purposes, and except further as hereinbefore expressly provided in Article VI hereof.

ART. X. Jurisdiction in the United States of America to construct the said dam and incidental works referred to in Article VI hereof is

[98]

hereby conceded, and consent is hereby expressly given by the signatory States to said construction and to the use and benefit of any property of the respective signatory

States which may be found necessary or convenient of use by the United States of America for said purpose.

ART. XI. This compact shall become binding and obligatory when the Colorado River compact has become binding and obligatory upon all of the signatory States thereto and when this compact shall have been approved by the legislatures of each of the signatory States hereto and by the Congress of the United States. Notice of the approval of the legislature shall be given by the governors of each of the signatory States to the governors of the other signatory States and to the President of the United States, and the President of the United States is requested to give notice to the governors of the signatory States of the approval by the Congress of the United States.

In witness whereof the representatives of the States of Arizona, California, and Nevada have signed this compact in a single original, which shall be deposited in the archives of the Department of State of the United States of America, and of which a duly certified copy shall be forwarded to the governor of each of the signatory States.

[99]

ARIZONA COUNTERPROPOSAL

(DECEMBER, 1925)*

The States of Arizona, California, and Nevada have appointed representatives for the purpose of negotiating an agreement among said States in reference to the waters of the Colorado River, who after negotiations have agreed upon the following articles:

ARTICLE I

It is recognized by the parties hereto that the unregulated normal flow of the Colorado River is insufficient to

* The text is copied from Hearings before the Senate Committee on Irrigation and Reclamation on S. Res. 320 (68th Congress, 2d Session), pp. 820-24.

properly irrigate the lands already under cultivation by irrigation from the waters of said river; that the benefits of the storage of the flood waters of said river within the United States belong wholly to the citizens of the respective States; that without disparagement of the treaty making power of the United States Government, the States party hereto and Congress of the United States in consenting to this agreement shall be understood as declaring: That it is their purpose to utilize within the borders of such States all of the waters of the normal flow of the Colorado River heretofore appropriated and put to beneficial use in accordance with the laws of the States in which the same are being put to beneficial use, and all of the flood waters of the Colorado River capable of being utilized within the borders of the United States, for any purpose, by the construction of storage dams within the United States, and particularly that the Republic of Mexico and the citizens thereof shall take notice that they can not acquire any moral or equitable claim to the waters of the Colorado River temporarily made available for use in said Republic of Mexico by the regulatory effect of any dam or dams constructed in pursuance of this agreement as it is the intention and purpose of the States party hereto and the United States to ultimately utilize all of such waters within their own borders. Any express or implied acknowledgement of rights to the Republic of Mexico to the waters of the Colorado River by any instrument, agreement or compact signed prior to this agreement which is inconsistent with the declarations of this paragraph, if there be any such inconsistent acknowledgement or declaration is hereby withdrawn and shall not be renewed or reasserted without the consent of the States party hereto.

Article II

The States of Arizona, California, and Nevada hereby agree that the waters of the Colorado River and its tributaries in said States shall be divided, allotted, and appropriated as follows:

[100]

(a) All of the waters of the tributaries of the Colorado River which flow into said river below Lee Ferry, Ariz., are hereby allotted and appropriated exclusively in perpetuity to the States in which such tributaries are located and may be stored in and diverted from said tributaries or the main channel of the Colorado River for use in said States.

(b) There is hereby allotted and appropriated to the State of Nevada for use in said State that portion of the total amount of water of the main Colorado River as measured at Lee Ferry, which can be beneficially used for agricultural and domestic purposes, not exceeding 300,000 acre-feet per annum.

There is hereby allotted and appropriated for agricultural and domestic use to each of the States of Arizona and California from the remainder of the water available as measured at Lee Ferry, one-half of the waters of the Colorado River.

(c) Any dimunition [*sic*] of the amount of water allotted to each State between the point of measurement and the point of delivery, caused by evaporation and seepage in storage or in transit, shall be borne by each State from its original allotment.

(d) The States of Arizona, California, and Nevada hereby agree to limit and control future appropriations and beneficial use of water in said respective States to such an amount and in such manner as will insure that present perfected rights in each State will be fully protected and supplied out of waters hereby allotted to said State.

ARTICLE III

The following rules shall apply to the use and storage of water under this agreement:

(a) The use of water for irrigation and domestic purpose allotted in Article II hereof shall be superior to any

right of storage for power purposes or navigation and any of said States may divert from the river the water allotted to it at any point on the river, provided that if any State shall take any water so allotted to it out of the main channel of the Colorado River at a higher elevation than the highest elevation of the bed of said river in said State, the works constructed for such purpose shall not interfere with a beneficial development in the State entitled to develop such fall of the river and the State or States taking out water at such higher elevation shall fully compensate the other States affected thereby for the loss of power caused thereby to such States.

(b) The prior construction of any dam or reservoir for power purposes shall not give any prior or superior right to such dam or reservoir to the regulation of the flow of the river for the benefit of such dam or reservoir but the rights of all dams and reservoirs constructed under this agreement for power purposes shall be on

[101]

equality regardless of the date of construction thereof subject to the following:

(1) Yearly and seasonal stored water shall be held at as high elevations on the river as possible in order to reduce evaporation losses and provide regulation for power as well as for irrigation, domestic and flood control purposes.

(2) Reregulation storage for seasonal and daily variations in demand shall be located as close to the land to be irrigated as possible and water for irrigation and domestic purposes shall be supplied first from the nearest reservoir above the point of diversion of such waters.

ARTICLE IV

The territory of no State shall be entered upon for the purpose of construction or maintaining works utilizing the

water of the Colorado River except with the consent, and subject to the laws of such State.

ARTICLE V

The necessity for flood protection and development of the Colorado River as herein provided for is hereby recognized and established. All private or public lands in Arizona, California, and Nevada that are necessary for the construction and operation of works for the control and utilization of the Colorado River for flood protection, irrigation and domestic uses of water and the construction of dams for power purposes in pursuance of the provisions of this agreement shall be subject to the right of eminent domain of the State wherein such lands are located unless they have already been put to a more necessary public use.

ARTICLE VI

Each of the States party hereto, and the United States, recognize the acute necessity for flood and drought protection for lands now in cultivation by irrigation from the waters of the Colorado River and hereby pledge their good faith to grant the necessary permits and licenses for such construction, also rights of way to any district or agency that may be created in pursuance of the terms of this agreement for the immediate construction of a reservoir in the main channel of the Colorado River at such point as may be determined upon by the Federal Government, if it be a Government project, or by the majority of the States party to this agreement, if by some other agency. Such permits, licenses, and rights of way shall include those necessary for the construction of the dam and reservoir and appurtenant works including hydro-electric power plants and transmission lines provided, that no dam or other works shall be built in the bed of the Colorado River at any point in the river which when constructed will back up the water of the river so as to limit or interfere with the construction of a dam selected by any of the States for

the diversion of water for irrigation or domestic purposes in that State.

[102]

ARTICLE VII

Any State in which reservoir sites exist in the Colorado River or its tributaries, directly or through any district or agency created in pursuance of and hereafter authorized by the laws of said State, may build dams, hydro-electric power plants and appurtenant works in such State and operate or lease the same. Where the reservoir is situated in two or more States, such dams, power plants and appurtenant works may be built, operated or leased jointly by the two or more States, or by any district or agency that may be created in pursuance of the laws of such States. Such State or States may sell or lease the power produced by such dams or power plants, and may impose taxation on such dams, power plants, transmission lines, and other property incident thereto, and may collect royalties on the power produced by such dams or power plants or any of them or impose a tax on such power or provide for both such tax and royalties on such power. Where development works are constructed in two or more States, the entire hydroelectric plant, including dams, reservoirs, power houses and appurtenant works shall be considered a unity in all matters relating to the financing of construction, the operation, lease, collection of royalties, and taxation, regardless of the location of the power plants with reference to State boundaries. The cost of the construction of all such development works shall be borne by the respective States, districts, or agencies created in pursuance of the laws of such States, and all power and revenue from the sale or lease of power, or royalties on the same, or taxation of such power or works, shall be divided among the States in direct proportion to the present amount of fall which the

river makes in each State between the dam and the elevation of the bed of the stream reached by the back water when the reservoir is filled. Where the river forms the boundary between two States, each State shall be allotted one-half of the fall which occurs in the present river bed on such joint boundary for the purpose of computing the relative proportions allotted to each State.

ARTICLE VIII

The use of power developed by such dams and works shall never vest in perpetuity in any private person or corporation, but the States and citizens of States in which such power is developed shall have preferred rights to its use whenever the need for it may arise: *Provided,* That leases for the use of power for terms not exceeding 50 years may be made by any such State or States or any district or agency hereafter created in pursuance of law when approved in such manner as may be provided by the laws of such State or States in which the power sites are situated: *Provided further,* That any State party hereto shall have the right to grant in perpetuity to any political subdivision or municipality of such state the share of the power to which such state is entitled under the provisions of Article II hereof.

ARTICLE IX

In the construction and operation of all dams and power

plants for the utilization of the waters of the Colorado River, undertaken in pursuance of the terms of this agreement the following rules shall apply:

Where such dams and power plants are located wholly in one State, the laws of that State shall govern such construction and operation. Where such dams and power plants are located in more than one State the States affected

shall agree upon the plans and rules and regulations for such construction and operation, and upon the agency to be adopted for such joint construction and operation, *provided:* That in the event two States are affected and they shall be unable to agree upon any such matter each of said States shall appoint a competent person as arbitrator and the two arbitrators so appointed shall agree upon a third arbitrator and the three arbitrators so appointed shall determine all such matters not agreed upon by said States.

ARTICLE X

Whenever the construction of a reservoir in two or more States shall be determined upon, the States in which the same is situated shall agree upon the royalties and taxes to be collected on the power to be produced by such reservoir and the works connected therewith and make any agreement that may be necessary to the taxation of such reservoir and works, provided said States shall be unable to agree or it shall be found impracticable to carry out a satisfactory agreement because of restrictions in the constitutions of said States or any of them, said States shall have allotted to them for their several use, benefit, and disposition their proportionate share (as determined by Article VII) of the power produced by such reservoir and works.

ARTICLE XI

In the event the United States shall undertake the construction, financing, and operation of any development on the Colorado River for flood control, irrigation, or power purposes, and requires the repayment of funds advanced for such purposes, such repayment to the Government shall be made in accordance with the reclamation act and amendments thereto. Each State shall assume an obligation in proportion to the allotment of water and power as provided in this agreement, and assure the Government the repay-

ment of all construction costs together with any interest charged for the full amount so advanced.

The allocation of water and power as in this agreement provided shall inure to the benefit of the States party hereto. Operation and administration of the same shall be under such State agencies as are created in accordance with the irrigation laws of the respective States. After all obligations to the Government have been met, the entire benefits shall become the property of the States interested, as provided in Article VII of this agreement. The contract with the United States to construct works in the States shall provide for dams, power plants, irrigation works, canals, and pumping plants which will enable each of the respective States to irrigate in each State an amount of land proportionately equal to the allotment

[104]

of water of such State. Any irrigation development where there is a cost for pumping shall be the beneficiary of the revenues derived from the sale of any portion of the power which is allotted to the respective States. Contracts for the sale of power shall be made agreeable to the respective States within which the power is developed.

Article XII

This agreement shall not become effective until it is approved by the Legislatures and Governors of the States of Arizona, California, and Nevada and by the Congress of the United States.

Submitted by the Arizona committee.

[105]

RECOMMENDATIONS OF GOVERNORS' CONFERENCE (1927)*

The governors of the States of the upper division of the Colorado River System suggest the following as a fair apportionment of water between the states of the lower division subject and subordinate to the provisions of the Colorado River Compact in so far as such provisions affect the rights of the upper basin states:

1. Of the average annual delivery of water to be provided by the states of the upper division at Lees Ferry, under the terms of the Colorado River Compact

(a) To the State of Nevada, 300,000 acre-feet.

(b) To the State of Arizona 3,000,000 acre-feet.

(c) To the State of California, 4,200,000 acre-feet.

2. To Arizona, in addition to water apportioned in subdivision (b), 1,000,000 acre-feet of water to be supplied from the tributaries of the Colorado River flowing in said State, and to be diverted from said tributaries before the same empty into the main stream; said 1,000,000 acre-feet shall not be subject to diminution by reason of any treaty with the United States of Mexico, except in such proportion as the said 1,000,000 acre-feet shall bear to the entire apportionment in 1 and 2 of 8,500,000 acre-feet.

3. As to all waters of the tributaries of the Colorado River emptying into the river below Lees Ferry, not apportioned in paragraph 2, each of the States of the lower basin shall have the exclusive beneficial consumptive use of such tributaries within its boundaries before the same empty

* Text copied from Wilbur & Ely, Hoover Dam Documents 38 (2d Ed. 1948). See also 70 Cong. Rec. 172 (1928).

into the main stream, provided the apportionment of the waters of such tributaries flowing in more than one state shall be left to adjudication or apportionment between said states in such manner as may be determined upon by the states affected thereby.

4. The several foregoing apportionments to include all waters necessary for the supply of any rights that now exist, including water for Indian lands for each of said states.

5. Arizona and California each may divert and use one-half of the unapportioned water of the main Colorado River flowing below Lees Ferry, subject to further equitable apportionment between the said states after the year 1963, and on this specific condition, that the use of said waters between the states of the lower basin shall be without prejudice to the rights of the States of the upper basin to further apportionment of water, as provided by the Colorado River Compact.

OPENING BRIEF OF THE CALIFORNIA DEFENDANTS IN SUPPORT OF THEIR EXCEPTIONS TO THE REPORT OF THE SPECIAL MASTER

MAY 22, 1961

TABLE OF CONTENTS

	PAGE
Report of the Special Master	1
Jurisdiction	2
Documents Involved	2
Questions Presented	4
Statement of the Case	7
I. Procedural Statement	7
II. The California Defendants	9
III. Existing Projects in Other Lower Basin States	16
A. Arizona Projects	16
B. Nevada Projects	18
C. Utah and New Mexico Projects	19
IV. Interstate Apportionment Proposed by the California Defendants of the Dependable Lower Basin Water Supply	20
A. The Evidence on Water Supply	20
B. Interstate Apportionment Proposed by California	21
C. The Master's Determinations on Water Supply	23
D. California Motions re Water Supply	23

V. Decision Recommended in the Master's Report 25
A. The "Mainstream" and "Tributary" Waters 25
B. The "Mainstream" Allocation 25
1. Basis of Water Rights 25
2. The Limitation on California 25
3. The "Contractual Allocation Scheme" 28
4. Federal Reservations 30
C. The "Tributary" Waters 31
1. "Tributary" Users *Inter Sese* 31
2. "Tributary" Users Vis-a-vis "Mainstream" Users 32
VI. Exceptions of the California Defendants 32
Summary of the Argument 33
Preliminary Statement 33
I. Introduction: The Basis of Water Rights 37
II. Construction of the Limitation on California's Rights 39
III. Destruction of Priorities by a Contractual Allocation Scheme 45
IV. Nonexistence of the Master's Contractual Allocation Scheme 47
V. Water Supply and Justiciability 49
Conclusion 51

ARGUMENT

PART ONE

Introduction to the Argument: Equitable Apportionment and Priority of Appropriation as the Foundation of Water Rights 52
1. Principles of Western Water Law 54
2. Principles of Priority of Appropriation 54
3. Federal Recognition of Appropriation Principles 62
4. Equitable Apportionment Doctrine 64

PART TWO

The Interpretation of the Limitation on California, Proposed in the Boulder Canyon Project Act and Accepted in the California Limitation Act, Is Controlled by the Meaning of the Colorado River Compact Expressly Incorporated by Reference in Both Statutes..... 69

Statement of the Issue..... 69

Significance of the Issue..... 74

I. The Special Master's Conclusion That Section 4(a) Cannot Be Read Literally Is Wrong..... 80

A. There Is No Distinction Between Article III(a) as Used in the Compact and Article III(a) as Used in the Project Act..... 80

B. A Natural and Literal Reading of the Limitation's Reference to the Compact Does Not Produce the Irrational and Unfair Results Discovered by the Master..... 85

1. Utah and New Mexico Would Not Be Excluded From All Lower Basin Uses..... 85

2. Upper Basin Would Not Be Excluded From Surplus..... 91

3. California Would Not Be Excluded From Use of More Than 4.4 Million Acre-Feet Per Annum Until Basin Uses Total 16 Million Acre-Feet Per Annum..... 92

C. Congress Did Not Exclude the Gila River System Waters From the Tri-State Compact Proposed in Section 4(a)..... 93

II. The Language of the Project Act Requires the Limitation To Be Given Its Natural and Literal Meaning To Incorporate the Colorado River Compact.....100

A. It Is Unreasonable To Reject the Project Act's Express and Specific Incorporation of the Colorado River Compact.....100

B. Article III(b) Waters Are Included in the "Excess or Surplus" Available to California if the Project Act Is "Read Literally".....106

III. The Legislative History of the Project Act Supports the Natural and Literal Meaning of the Limitation's Incorporation of the Colorado River Compact 110

A. The Limitation's Incorporation of the Compact Is Purposeful and Rational.....112

B. Senator Phipps, Author of the Limitation and Chairman of the Reporting Committee, Made His Intention To Refer to the Compact Unmistakable 118

C. Confused, Conflicting, and Ambiguous Statements on the Floor of the Senate Cannot Overturn the Natural and Literal Incorporation of the Compact in the Limitation.....121

IV. Truncation of the Colorado River at Lake Mead Is Not Logical Because Diversions of Water From Bridge Canyon (Above Lake Mead) Have Been Planned for Use in Both Arizona and California Before and After Enactment of the Project Act.....124

V. The Consensual Nature of the Limitation, Established by the Project Act and the Reciprocal California Limitation Act Upon Six-State Ratification of the Compact, Requires a Natural and Literal Reading of the Limitation To Incorporate the Colorado River Compact.....128

PART THREE

The Master Erred in Holding That the Boulder Canyon Project Act Authorized the Secretary of the Interior To Impose a Federal Interstate Apportionment on the States, Without Their Consent, by a "Contractual Allocation Scheme" 138

Statement of the Issue 138

I. The Holding in *Arizona v. California,* 283 U.S. 423 (1931), Conclusively Determined That the Project Act Did Not Abrogate the Principles of Priority of Appropriation and Equitable Apportionment 139

II. Even if the Issue Were Not Concluded by *Arizona v. California, Supra,* the Project Act Does Not Abrogate, but Preserves, Priority and Equitable Apportionment Principles 145

A. Project Act Sections 18, 14, 8, and 4 Preserve Priority and Equitable Apportionment Principles 145

1. Section 18 145
2. Section 14 147
3. Sections 8(a) and (b) and 4(a), First Paragraph 158

B. Legislative History and Administrative and Practical Construction of the Project Act Confirm Preservation of Priority and Equitable Apportionment Principles 158

1. Legislative History 159
2. Subsequent Congressional Construction 161
3. Administrative and Practical Construction 162
4. Statutory Scheme of the Reclamation Law 165

III. The Master Misconstrues and Misapplies Sections 5 and 8(b) of the Project Act....166

A. Section 5 of the Project Act Is Not a Source of Authority for the Interstate Allocation of "Mainstream" Waters....168

1. The Statutory Scheme of the Project Act....169

2. Legislative History of Section 5....175

3. Senators Quoted by the Special Master....182

B. Section 8(b) Does Not Sustain the Master's Interpretation of Section 5....188

C. The Congressional Plan Is Wholly Contrary to That Deduced by the Special Master....191

PART FOUR

The Secretary's Water Delivery Contracts Do Not Establish Any Fractional "Contractual Allocation Scheme"....195

I. The Master's Reasoning Refutes Itself: California Agencies Cannot Be Assumed To Have Accepted a "Federal Apportionment" More Adverse to California Than the Tri-State Compact That Congress Refused To Require and That California Refused To Ratify....195

II. The General Regulations Promulgated by the Secretary of the Interior Pursuant to the Project Act Refute the Inference That the Secretary Created Any "Contractual Allocation Scheme"....196

III. None of the Elements of the Master's Contractual Allocation Scheme Are Found in the Water Delivery Contracts Themselves....200

A. The Delivery Contracts Do Not Purport To Apportion to Any State the Quantities Specified by the Master....201

B. The Circumstances Surrounding the Execution of the Water Delivery Contracts Belie the Existence of a "Contractual Allocation Scheme"....204

IV. California's Rights Under the Secretary's Contractual Allocation, if He Made One, Are Controlled by the Proper Interpretation of the Limitation Act, to Which the Contracts Are Necessarily Subject.....206

V. Shortages in "Article III(a) Waters" Are Borne Interstate Under Priority and Equitable Apportionment Principles; the Contracts Do Not Purport To Substitute Proration.....211

A. Priority and Equitable Apportionment Principles Control the Burden of Bearing Shortages, Interstate, in "Article III(a) Waters".....211

B. The Master's Conclusion That Shortages in "Article III(a) Waters" Are Borne Pro Rata Is Based Upon Inferences Improperly Drawn From Erroneous Constructions of the Controlling Documents 215

1. Proration of "Excess or Surplus" by the "Contractual Allocation Scheme".....216

2. "Present Perfected Rights" Provision in Section 6 of the Project Act.....217

3. Approval of the Colorado River Compact by the Project Act.....221

4. The Tri-State Compact Set Forth in the Second Paragraph of Section 4(a) of the Project Act.....222

5. The Principle of Sovereign Parity.....225

6. Administrative Construction 227

C. The Master's Proration Scheme Would Provide an Illogical and Impractical Dual System of Water Rights in the Lower Basin.....228

PART FIVE

The Dependable Water Supply Can and Must Be Determined 232

I. The Dependable Water Supply Must Be Determined To Establish the Existence of a Justiciable Controversy 235

II. The Dependable Water Supply Must Be Determined To Compare the Result Proposed by the Decree With the Result Intended by Congress in 1928 236

III. The Premises Upon Which the Master Decides That Dependable Water Supply Is Undeterminable Are in Error but, if Correct, Would Make the Controversy Nonjusticiable 240

IV. The Master Overstates the Difficulty of Determining Water Supply 241

A. Necessity and Feasibility 241

B. What Is Meant by "Dependable Supply" or "Safe Annual Yield" 243

C. The Magnitude of the Dependable Supply 243

1. Controlling Factors 243

2. Techniques of Determining Water Supply 243

3. Conclusions of the Experts 245

D. The Master's Rejection of the Experts' Determinations of Dependable Supply 246

E. The Effect To Be Given the Colorado River Compact 246

F. Consequences of the Master's Concept of Article III(a) of the Compact as a "Ceiling" on Appropriations Instead of an Apportionment in Perpetuity 250

1. The Legal Problem.....250
2. The Factual Problem if the Compact Is Treated Merely as a "Ceiling" on Appropriations 251
G. Hydrologic Factors.....253
1. The Master's General Criticism of the Science of Hydrology.....253
2. Period Selected 254
3. The Difficulty of Operating Reservoirs.....257
4. Bureau of Reclamation Studies, After the Close of Trial.....259
V. The Proposed Allocation, Tested by the Realities of the Water Supply, Is Inconsistent and Inequitable....261
A. Rights in Natural Flow Not Dependent on Storage 262
B. Allocation of the Benefits of Storage.....263
C. Allocation of the Burden of Shortages.....265
VI. The Proposed Allocation, Tested by the Realities of the Water Supply, Would Destroy the Water Rights of The Metropolitan Water District of Southern California, and Should Be Rejected on Equitable Grounds 266
VII. California Does Not Ask That Unused Upper Basin Water Waste to the Sea, but That the Risk of Its Ultimate Withdrawal Fall Upon the Projects Hereafter Constructed To Use It.....277
PART SIX
Miscellaneous Matters.....279
1. The Colorado River Indian Reservation Boundary.....279
2. Federal Rights for Indian Reservations and Other Federal Lands.....283

3. The Inappropriateness of Injunctive Relief.....284
4. The Retention of Jurisdiction for Future "Mainstream"—"Tributary" Controversies.....287
5. The Inclusion of Underground Water Uses.....289
6. Holders of Natural Flow Rights Are Entitled to Water Delivery Contracts.....290

CONCLUSION.....292

OPENING BRIEF*

This single consolidated brief of all eight California defendants[1] is filed in accordance with the notice accompanying the order of the Court (364 U.S. 940), dated January 16, 1961.[2]

REPORT OF THE SPECIAL MASTER**

On January 16, 1961, this Court received and ordered filed (364 U.S. 940) the Report of the Special Master, dated December 5, 1960, which was submitted under this order of reference (347 U.S. 986 (1954)):

> "The master[3] is directed to find the facts specially and state separately his conclusions of law thereon, and to submit the same to this Court with all convenient speed, together with a draft of the decree recommended by him. The findings, conclusions, and recommended decree of the master shall be subject to consideration, revision, or approval by the Court."

---

[1]State of California *(parens patriae)* and seven public agencies of this state: Palo Verde Irrigation District, Imperial Irrigation District, Coachella Valley County Water District, The Metropolitan Water District of Southern California, City of Los Angeles, City of San Diego, and County of San Diego.

[2]Pursuant to that notice, exceptions to the Special Master's Report were filed with the Court on February 27, 1961; this opening brief is filed on May 22, 1961; our answering brief is to be filed August 14, 1961; and our reply brief is to be filed October 2, 1961.

[3](Footnote ours.) Hon. Simon H. Rifkind was appointed Special Master in 1955, succeeding Hon. George I. Haight, deceased. 350 U.S. 812.

*The appendix of this brief consists of (1) a description of the California projects and their development and (2) tables 1-6 and plates 1-11 referred to during the course of this brief.

**In this brief, "Rep. 103" refers to page 103 of the Report; "Rep. app. No. 2" refers to appendix number 2; "Rep. app. 416" refers to page 416 which is in the appendixes.

JURISDICTION

This Court has jurisdiction of the parties and of the subject matter of the case as tendered by the pleadings of all parties, under the provisions of article III, section 2, clause 2, of the Constitution of the United States, and 28 U.S.C. § 1251(a)(1) (1958). Arizona's motion for leave to file her bill of complaint against the California defendants was not opposed, and the motion was granted on January 19, 1953. (344 U.S. 919.)

Two further jurisdictional issues remain: (1) Is this suit presently ripe for adjudication as a "case" or "controversy" within the judicial power of the United States Supreme Court? U.S. CONST. art. III, § 2, cl. 2. (2) Is this suit appropriate for adjudication within the original jurisdiction of this Court over suits among states by presenting a "threatened invasion of rights" which is "of serious magnitude" and "established by clear and convincing evidence"? *New York v. New Jersey,* 256 U.S. 296, 309 (1921). See Rep. 130, 319-20. These questions of justiciability, inseparable from the water supply issues, are considered in detail in the Argument *infra* pp. 235-36, 246-53.

DOCUMENTS INVOLVED

The text of the Compact, statutes, and some of the contracts involved in this litigation are set forth in the appendixes to the Report of the Special Master (Rep. app. Nos. 2-8).

1. Colorado River Compact (Rep. app. No. 2)[4]

[4]Ariz. Ex. 1 (Tr. 214).

2. Boulder Canyon Project Act of Dec. 21, 1928, 45 Stat. 1057, 43 U.S.C. §§ 617-617t (1958) (Rep. app. No. 3)[5]

3. California Limitation Act, CALIF. STATS. 1929, ch. 16, at 38 (Rep. app. No. 4)[6]

4. Water delivery contracts executed over a 50-year period between the Secretary of the Interior and states, public agencies, and individuals, most of which are tabulated in appendix F, volume 2 of California's Proposed Findings of Fact and Conclusions of Law[7] (see Rep. app. Nos. 5-8 for the contracts with the states of Nevada and Arizona and the Palo Verde Irri-

[5]Ariz. Ex. 7 (Tr. 222).

[6]Ariz. Ex. 14 (Tr. 232).

[7]The following water delivery contracts are not included in appendix F:

(a) Contract between the Secretary and the City of Yuma, Arizona, approved in 1960 after the trial had concluded (Calif. Ex. 7611 for iden. (Tr. 22,760)).

(b) Water right applications with individual water users in the Bard Irrigation District (Tr. 8,819-20; Calif. Ex. 50 (Tr. 6,898)), the non-Indian portion of the Yuma Project in California, which has no water delivery contract. On approval by the Secretary, the water right applications become the only contracts for the use of water within that project. Exemplary contracts (executed both before and after the Project Act) are Calif. Exs. 378-380 (Tr. 8,852), discussed *infra* pp. 152-55.

(c) Contract between the Secretary and the Yuma County Water Users' Association, executed in 1906 for use of water within the Valley Division of the Yuma Project (U.S. Ex. 19-T (Tr. 15,518)). This contract controlled deliveries of water to the Valley Division of the Yuma Project until the parties executed a supplemental contract in 1951 (Ariz. Ex. 92 (Tr. 357)).

(d) Contract between the Secretary and the North Gila Valley Irrigation District, executed in 1918 for use of water within the North Gila Valley (Ariz. Ex. 91 (Tr. 356)). This contract controlled deliveries of water to the North Gila Valley until the parties executed a supplemental contract in 1953 (Ariz. Ex. 95 (Tr. 360)).

gation District, representative of the California agency contracts)

QUESTIONS PRESENTED

1. The critical words in the first paragraph of section 4(a) of the Boulder Canyon Project Act, repeated substantially *in haec verba* in the reciprocal California Limitation Act, are identified by bracketed numbers and emphasis in the following quotation from the statute (Rep. app. 382):

> "California . . . shall agree . . . that the aggregate annual consumptive use . . . of water . . . from the Colorado River for use in the State of California . . . shall not exceed four million four hundred thousand acre-feet of the [1] *waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact,* plus not more than one-half of any [2] *excess or surplus waters unapportioned by said compact,* such uses always to be subject to the terms of said compact."

The questions presented are:

(a) Do the emphasized words identified by the bracketed [1] refer to Article III(a) of the Colorado River Compact which apportions to the lower basin the beneficial consumptive use of 7,500,000 acre-feet per annum from the waters of the Colorado River system (main stream and tributaries); or do those words refer, not to the Compact or any provision thereof, but to the first 7,500,000 acre-feet of water per annum available for consumptive use from the "mainstream" (defined by the Report as Lake Mead and the main Colorado

River below Lake Mead, excluding all tributary systems in the lower basin and the main Colorado River between Lee Ferry and Lake Mead)?

(b) Do the emphasized words identified by the bracketed [2] refer to any provisions of the Compact; or do those words refer, not to the Compact, but to all water available for consumptive use from the "mainstream" (as defined in the Report) in excess of the first 7,500,000 acre-feet?

2. Did the Boulder Canyon Project Act abrogate equitable apportionment and priority of appropriation principles within the "mainstream" (as defined in the Report), excepting only "present perfected rights" (however defined), and delegate authority to the Secretary of the Interior to make an interstate allocation of "mainstream" waters among Arizona, California, and Nevada by the execution of water delivery contracts?

3. If Congress delegated such authority to the Secretary, did successive Secretaries of the Interior between 1930 and 1944 allocate the first 7,500,000 acre-feet of "mainstream" water available for consumptive use 28/75 to Arizona, 44/75 to California, and 3/75 to Nevada, disregarding all priorities except "present perfected rights," (defined in the Report as (a) quantities of water consumptively used as of June 25, 1929, and (b) rights of the United States pursuant to federal reservations made prior to June 25, 1929, without regard to use), and did they allocate "excess or surplus" above that 7,500,000 acre-feet equally between California and Arizona (subject to reduction of Arizona's half by future contract with Nevada)?

4. Is the existence of a justiciable controversy ascertainable in the absence of a determination of the dependable (permanent) water supply of the main Colorado River in the lower basin?

5. Is the determination of the dependable (permanent) water supply of the main Colorado River necessary to resolve the issues on the merits?

STATEMENT OF THE CASE

I. PROCEDURAL STATEMENT

The present case is the fifth suit in the original jurisdiction of this Court affecting the lower basin of the Colorado River, although it is the first in which evidence has been taken.[1]

Arizona's present suit against the California defendants was precipitated by her claim for a dependable and permanent water supply for the proposed Central Arizona Project. (Rep. 30-31, 130-31.) That project was designed to divert 1,200,000 acre-feet of water from the main Colorado River for irrigation in the Phoenix area of central Arizona.[2] Alternative diversion points for the project were considered at Parker Dam (below Lake Mead) and at Bridge or Marble canyons (above Lake Mead).[3]

In 1948, the Secretary of the Interior reported to Congress that there would be a dependable water supply for this new project if the legal contentions then advanced by Arizona were correct, but not if the legal contentions of California were correct. After exhaustive congressional consideration of bills to authorize the project, the House Interior and Insular Affairs Committee in 1951 by resolution refused to consider Central

[3]Rep. 227. See also Ariz. Ex. 71, *supra* note 2, at 117; H.R. Doc. No. 419, 80th Cong., 1st Sess. 179-80 (1947), other portions of which are Ariz. Ex. 64 (Tr. 290); Tr. 4,121 (Akin). *Accord,* 13 ARIZ. INTERSTATE STREAM COMM'N ANN. REP. 31 (1960), quoted *infra* p. 125.

Arizona Project legislation further until that controversy was resolved by agreement or by litigation. (Rep. 30-31, 130-31.)

Arizona brought the controversy to this Court in 1952 (Rep. 1). The California defendants welcomed the opportunity for its resolution.[4] The United States (an indispensable party)[5] intervened, as did Nevada, and, on motion of the California defendants, Utah and New Mexico were joined with respect to their interest in "Lower Basin waters."[6] (Rep. 2.) Thus, all states of the lower basin as defined in the Colorado River Compact[7] are now before the Court.

Issues were joined on the pleadings of all parties, and the case was referred to the Special Master for hearing and recommendation. After pre-trial conference and a trial conducted over a three-year period, the parties simultaneously submitted proposed findings of fact, conclusions of law, and supporting briefs[8] and,

---

[4]Calif. Return To Rule To Show Cause and Brief in Support of Return, filed Dec. 8, 1952, pp. 1-2, 5-6, 13.

[5]Arizona v. California, 298 U.S. 558 (1936).

[6]California moved to join as necessary parties the states of Colorado, New Mexico, Utah, and Wyoming. The Court denied our motion to join Colorado and Wyoming, but granted the motion to join Utah and New Mexico "only to the extent of their interest in Lower Basin waters." 350 U.S. 114 (1955) (5-3 decision).

[7]Colorado River Compact art. II(g) (Rep. app. 372):

"The term 'Lower Basin' means those parts of the States of Arizona, California, Nevada, New Mexico, and Utah within and from which waters naturally drain into the Colorado River System below Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the System below Lee Ferry."

[8]Tr. 21,666-71. During the course of this brief we shall occasionally refer to our own proposed findings and conclusions, which are part of the record before the Court, as a convenient way of avoiding multiple references to the transcript and exhibits. Each proposed finding is annotated with citations to the evidence.

subsequently, simultaneous answering and rebuttal briefs. On July 1, 1959, the matter was submitted for consideration. (Rep. 2-3.) On May 5, 1960, the Master circulated among the parties his draft report for the purpose of receiving their suggestions. On motion by the California defendants, oral argument was held in New York City on August 17-19, 1960, on the draft report and recommended decree. (Rep. 3-4.)

The Report of the Special Master, dated December 5, 1960, which makes no material changes in the decision proposed by the draft report, was received and ordered filed by this Court on January 16, 1961 (364 U.S. 940).[9] The parties are now before the Court on exceptions to that Report, which the parties filed on February 27, 1961.

II. THE CALIFORNA DEFENDANTS

The California defendants are the State of California, *parens patriae,* and seven public agencies of this state which depend upon Colorado River water.[1] These de-

---

[9]To avoid multiple citations to the transcript, exhibits, and other materials, we cite the Master's Report as a convenient reference to factual and procedural matters not in dispute.

[1]These defendants are Palo Verde Irrigation District, Imperial Irrigation District, Coachella Valley County Water District, The Metropolitan Water District of Southern California, City of Los Angeles, City of San Diego, and County of San Diego. The latter cities and county are included within the boundaries of, and are served with Colorado River water by, Metropolitan Water District.

fendants divert and use Colorado River water for three projects:[2]

(1) Palo Verde Irrigation District Project (Rep. 35, 58-60).

(2) All-American Canal Project (Rep. 35, 36-38), which serves defendants Imperial Irrigation District (Rep. 53-55) and Coachella Valley County Water District (Rep. 55-58), and the Yuma Project (Reservation Division, including the Bard District[2a]) in California (Rep. 60-61).

(3) The Metropolitan Water District of Southern California (Rep. 61-69), whose Colorado River Aqueduct (Rep. 38-39) serves the southern California coastal plain, including defendants City of Los Angeles and City and County of San Diego (see Rep. 69-71).

A detailed description of each California project and agency, the area served by each, and the progressive stages of development of each is appended to this brief. (See also table 1 *infra.*)

Water rights were first initiated for the Palo Verde area in 1877 (appendix, p. A4), for the Imperial and Coachella areas in 1893-1899 (appendix, p. A10), for the Yuma area in 1905 (appendix, pp. A13-14), and for what is now the Metropolitan Water District service area in 1924 and 1926 (appendix, pp. A28-29).

---

[2]There are no tributaries of the Colorado River system in California (Rep. 11), and all three California projects now have access to its waters only from the main Colorado River below Hoover Dam. (See map of Colorado River basin, plate 11 *infra.*)

[2a]Tr. 8,819-20; Calif. Ex. 50 (Tr. 6,898).

Although there is some dispute about exact quantities, there is no dispute that several hundred thousand acres requiring the consumptive use[3] of substantially more than 2,000,000 acre-feet per annum of Colorado River water were irrigated in California in the Palo Verde, Imperial, and Yuma areas by November 24, 1922,[4] when the Colorado River Compact was signed by its negotiators (Rep. 24). Nor is there any dispute that nearly a half million acres requiring the consumptive use of more than 2,900,000 acre-feet per annum of Colorado

---

[3]Meaning diversions less return flows. See Rep. 148-49, 186, 345 (Decree art. I(A)).

[4]Consumptive use in 1922 is computed to have been 106,560 acre-feet for 32,644 acres in Palo Verde (Calif. Ex. 356 (Tr. 8,729)) and 48,522 acre-feet for 13,122 acres in Yuma Project (Reservation Division), California (Calif. Ex. 376 (Tr. 8,842)). In 1922, Imperial diverted 2,890,282 acre-feet with 413,400 net acres irrigated and in 1920 had diverted over 3,000,000 acre-feet with 414,720 net acres irrigated (Calif. Ex. 270 (Tr. 8,127)). Because Imperial is outside of the natural drainage basin of the Colorado River, its consumptive use is very nearly equal to its diversions. From 1901 to 1942, Colorado River water was diverted for Imperial Valley through the Alamo Canal, which ran partly through Mexico (Rep. 54-55). The portion of the water taken from the Alamo Canal for use in Mexico was a necessary loss incurred in bringing the water to Imperial Valley. This loss, which has been salvaged by construction of the All-American Canal, averaged less than 20% of the total annual diversion during the 1926-1930 period. (Calif. Ex. 273 (Tr. 8,140).)

See Ariz. Reply to Calif. Answer, par. 4, p. 13: "Admits that on November 24, 1922, irrigation distribution systems were in operation providing service to Palo Verde, Imperial, and the Yuma Project in California. . . . [A]lleges that as of said date the irrigated acreage so served did not exceed 461,000 acres and the beneficial consumptive use thereon of Colorado River System water did not exceed 2,350,000 acre-feet per year."

River water were irrigated in those three areas by June 25, 1929,[5] when the Boulder Canyon Project Act, the California Limitation Act, and the Compact itself (as among six of the seven signatory states, except Arizona) all became effective simultaneously upon presidential proclamation thereof (Rep. 26-27).

Construction of the All-American Canal,[5a] which was

---

[5]Arizona and Nevada concede that by June 25, 1929, about 2,900,000 acre-feet had been put to use in these three areas. Ariz. Reply to Calif. Answer, par. 28(b), p. 26: "Alleges that on June 25, 1929, projects had been constructed and were in operation in California for the irrigation of no more than 473,500 acres of land which required a net main stream depletion of about 2,902,000 acre-feet of water per annum"; Nev. Comments on Draft Report, dated June 6, 1960, pp. 10-13, 24-26, submitting that "present perfected rights" in California for non-Indian projects (limited, as defined in the Report, to the quantity of water put to consumptive use by June 25, 1929 (Rep. 307-08)) be determined from the record as 2,944,560 acre-feet per annum, comprising present perfected rights for "Palo Verde Valley" (120,560 acre-feet); "Yuma Project, Bard Dist." (17,000 acre-feet), and "Imperial Irr. Dist." (2,807,000 acre-feet).

California submitted Supplemental and Alternative Findings of Fact and Conclusions of Law, dated June 1, 1959 (bound with Calif. Responses of that date), showing that as of June 25, 1929, approximately 3,275,000 acre-feet had been put to beneficial consumptive use in these three areas (including all necessary losses in Mexico from the Imperial diversion, *supra* note 4) for the irrigation of 461,000 acres (supplemental conclusion 19D:202, pp. XIX-27 through 28); that as of June 25, 1929, diversion works and canals had been constructed in these three areas for the irrigation of approximately 703,600 acres with a beneficial consumptive use requirement of approximately 3,707,100 acre-feet per annum (supplemental conclusion 19D:201, pp. XIX-25 through 26); and that these three water users could have taken and consumed from the natural flow of the Colorado River without Hoover Dam regulation about 4,490,500 acre-feet per annum under their senior rights preexisting June 25, 1929 (supplemental findings and conclusions, part XIX-C, pp. XIX-18 through 23).

[5a]For early reports on the All-American Canal, see, *e.g.*, Calif. Ex. 185 (Tr. 7,647) ("Report of the All-American Canal Board," dated July 22, 1919); Ariz. Ex. 45 (Tr. 254) (S. Doc. No. 142, "Fall-Davis Report," 67th Cong., 2d Sess. 11-12, 64-71, 77-92 (1922), plates 49-52 following 187). Ariz. Ex. 45 is reproduced and bound with Calif. Exhibits, vol. 24.

authorized by section 1 of the Boulder Canyon Project Act (Rep. app. 379), began in 1934, and the first significant use of the canal was made in 1940 (Rep. 37). It replaces the Alamo Canal, the former diversion canal for Imperial, which ran partly through Mexico (Rep. 54-55). Construction of the Coachella Canal, which turns out from the All-American Canal, began in 1938, and it was completed in 1947 and 1948 (Rep. 38, 57).

Engineering and surveying work on the Colorado River Aqueduct took place continuously from 1923 to 1933; construction, which began in 1932, was completed in 1940; and water was first delivered by Metropolitan Water District in 1941. (Rep. 39, 65-66.)

Between 1930 and 1934, the Secretary of the Interior, acting for the United States, executed water delivery contracts for the delivery of stored water from Lake Mead with California public agencies (Rep. 28): Palo Verde Irrigation District,[6] Imperial Irrigation District[7] (amended by a supplementary contract in 1952),[8] Coachella Valley County Water District,[9] Metropolitan Water District,[1] and the City of San Diego[2] (merged in 1947 with Metropolitan[3]). Non-Indian users in the Yuma Project (Reservation Division) in California hold individual water right applications executed pursuant to the reclamation laws both before and after enactment of the Project Act,[4] but there is no water delivery contract for this area which purports to be executed pursuant to the Boulder Canyon Project Act.

[6]Ariz. Ex. 33 (Tr. 249).
[7]Ariz. Ex. 34 (Tr. 249).
[8]Ariz. Ex. 37 (Tr. 250).
[9]Ariz. Ex. 36 (Tr. 250).
[1]Ariz. Ex. 39 (Tr. 252), amending Ariz. Ex. 38 (Tr. 251).
[2]Ariz. Ex. 40 (Tr. 252).
[3]Ariz. Ex. 42 (Tr. 253).
[4]Exemplary contracts are Calif. Exs. 378-380 (Tr. 8,852).

The water delivery contracts executed with the California public agencies (see notes to preceding paragraph) call for delivery of stored water in accordance with the Seven-Party Agreement[5] signed in 1931 by all California defendants (except the state) in response to a request from the Secretary of the Interior.[6] By its terms (the effect of which is tabulated in appendix, p. A3), priorities among its signatories and the Yuma Project (Reservation Division) in California, *inter sese,* are assigned for the consumptive use in California of 5,362,000 acre-feet per annum of Colorado River water. Briefly summarized, the first three priorities, totaling 3,850,000 acre-feet per annum, belong to Palo Verde, Yuma, Imperial, and Coachella; the fourth priority, 550,000 acre-feet per annum, is now held by Metropolitan, as is the fifth priority of 662,000 acre-feet per annum; the sixth priority, 300,000 acre-feet, is shared by Palo Verde, Coachella, and Imperial. This priority schedule from the Seven-Party Agreement is incorporated *in haec verba* in each of the California water storage and delivery contracts (Rep. 28; Rep. app. 425-28).

As of the date to which the evidence related (1955-1957), the California projects were consuming approximately 4,600,000 acre-feet per annum of Colorado River water.[7] In 1960, the Colorado River Aqueduct of Metro-

---

[5]Ariz. Ex. 27 (Tr. 242).

[6]Calif. Ex. 1810 (Tr. 12,244).

[7]The table at Rep. 128 shows the "Approximate Consumptive Use of Mainstream Water in California" as 4,483,885 acre-feet per annum as of 1955-1957. The quantity shown for Metropolitan Water District is 481,493 acre-feet in 1956, but this should be increased to 584,000 acre-feet for 1957 (Rep. 128 n.73). California's total consumptive use would thus be 4,586,392 acre-feet per annum as of the date of evidence, rounded to 4,600,000 acre-feet per annum.

politan Water District[8] diverted about 900,000 acre-feet for consumptive use or about twice its use of four years ago.[9] In the early months of 1961, and as this brief was printed, the aqueduct was running at full capacity. Under ultimate development, these California projects are capable of putting at least 5,362,000 acre-feet per annum of Colorado River water to beneficial consumptive use, which is the quantity specified in the Seven-Party Agreement.[10] Total investments by the projects, excluding private investments, exceeded $500,000,000 as of the date of the evidence (appendix, pp. A7, A20-21, A27, A28, and A33-34).

There are in California certain federal establishments for which the United States claims rights to Colorado River waters. These federal claims, which are relatively minor in California, have been sustained by the Special Master.[11] The Yuma Indian Reservation, which

---

[8]The aqueduct is capable of diverting at least 1,212,000 acre-feet per annum from the Colorado River.

[9]The aqueduct diverted 481,493 acre-feet in 1956 (Rep. 128) and 584,000 acre-feet in 1957 (Rep. 128 n.73). See appendix, pp. A35-36, for data on consumption since the close of evidence.

[10]Even under the decree proposed by the California defendants, only 4,600,000 acre-feet of Colorado River water is available for consumptive use in California from the dependable or permanent supply. See *infra* p. 21.

[11]These are for the Chemehuevi Indian Reservation (Rep. 267); Yuma Indian Reservation (Rep. 268-69); portions of the Colorado River Indian Reservation within California, Rep. 271-72 (findings 8-13, 15, 17), Rep. 273 (conclusions 1, 5-7), and Rep. 274-78 (opinion); and portions of the Fort Mohave Indian Reservation within California, Rep. 281 (finding 14). These rights are adjudicated in the recommended decree, Rep. 350-52 (Decree art. II(C)(2)(a), (c), (d), and (e)).

In addition to the Indian claims, the Report also sustains federal claims for the Havasu Lake National Wildlife Refuge, Rep. 298-99, 352 (Decree art. II(C)(2)(g)) and Imperial National Wildlife Refuge, Rep. 299-300, 352-53 (Decree art. II(C)(2)(h)), both of which are partly in California.

is one of these federal establishments in California, is included within the Yuma Project (Reservation Division), California, discussed above. (See Rep. 60-61, 87-88.)

III. EXISTING PROJECTS IN OTHER LOWER BASIN STATES

A. Arizona Projects

Arizona pleaded that on November 24, 1922, the "Arizona irrigated acreage served by water diverted from the main stream of the Colorado River amounted to 73,000 acres with appropriative rights for sufficient water to irrigate said acreage."[1] As of June 25, 1929, Arizona projects consumed less than 250,000 acre-feet per annum of water from the main Colorado River.[2]

The ultimate beneficial consumptive use requirements of existing Arizona projects diverting from the main Colorado River are approximately 1,200,000 acre-feet

---

[1]Ariz. Reply to Calif. Answer, par. 4, pp. 13-14.

[2]Nev. Comments on the Draft Report, submitted June 6, 1960. pp. 12, 24, show, with citations to the record and explanation of the calculations, the following consumptive use in 1929 by non-Indian projects in Arizona (in acre-feet per annum):

North and South Gila Valleys	23,900
City of Yuma	200
Yuma Project	164,700
Total	188,800

The record does not show the historic consumptive use (diversions less returns to the stream) for the Colorado River Indian Reservation, the only federal establishment in Arizona which made any significant consumptive use of main stream water by 1929. However, U.S. Ex. 575 (Tr. 14,498) shows a computed diversion requirement of 39,508 acre-feet for 5,683 irrigated acres in 1929 for that reservation, and consumptive use (diversions *less* returns) would obviously have been less.

per annum.[3] (See table 2 *infra.*) The consumptive use by these projects in 1955 was substantially less than their total requirements.[4]

In 1944, the Secretary of the Interior executed a water delivery contract with the State of Arizona[5] for delivery of certain quantities of stored water in Lake Mead to users within that state as may contract therefor with the Secretary, and as may qualify under the reclamation law or other federal statutes, or to federal lands within Arizona.[6] The contract also provides, *inter alia,* that "present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this contract."[7]

There are also in Arizona certain federal establishments for which the Master has sustained the United States claims for Colorado River water based on fed-

---

[3]See Calif. Findings and Conclusions, part IV-D, pp. IV-29 through 43, and parts XIV-A through XIV-F, pp. XIV-3 through 56.

[4]The Master reports that "Approximate Diversions of Mainstream Water in Arizona" in 1955 totaled 1,239,140 acre-feet (Rep. 127). Consumptive use (diversions from the main stream *less* return flow thereto) is a lesser figure; however, the Master asserts that the Arizona diversions "cannot, on this record, be translated into consumptive use" because no figures are available for return flow from Arizona projects diverting at Imperial Dam (Rep. 126). The Master does report two figures of partial return flow totaling 269,600 acre-feet from Arizona projects (Rep. 126, 127 n.71), so that consumptive use in Arizona of water diverted from the main Colorado River in 1955 was surely less than 1,000,000 acre-feet (1,239,140 minus 269,600).

[5]Ariz. Ex. 32 (Tr. 248), Rep. app. No. 5.

[6]Art. 7(*l*) (Rep. app. 403).

[7]*Ibid.*

eral reservations of public lands.[8] The Colorado River Indian Reservation in Arizona is one of the existing projects discussed above.[9]

Arizona projects on the Gila River system take and consume the major portion, about 1,715,000 acre-feet per annum, of the safe annual yield of that system, which is 1,750,000 acre-feet per annum.[1] In addition, Arizona projects require about 82,500 acre-feet per annum from other lower basin tributaries (Little Colorado, Kanab Creek, Virgin, and Bill Williams river systems, and other very minor tributaries).[2]

B. Nevada Projects

Nevada's use from the main Colorado River by June 25, 1929, was nil.[3] Projects authorized or constructed to date will require, under ultimate development, the consumptive use of about 120,500 acre-feet per annum

---

[8]These are the Cocopah Indian Reservation (Rep. 267-68); Colorado River Indian Reservation, most of which is in Arizona (Rep. 269-74); Fort Mohave Indian Reservation, part of which is in Arizona (Rep. 279-83) (findings 1-13 and 16, and conclusions 1-6); and portions of the Lake Mead National Recreation Area (Rep. 294-95), Havasu Lake National Wildlife Refuge (Rep. 298-99), and Imperial National Wildlife Refuge (Rep. 299-300). These federal rights are adjudicated in the recommended decree, art. II(C)(2)(b) and (d) through (h) (Rep. 350-53).

[9]See Calif. Findings and Conclusions, part XIV-B, pp. XIV-8 through 20.

[1]See Calif. Findings and Conclusions, parts V-G and V-H, pp. V-35 through 48; Calif. Findings 4F:101, p. IV-54; 16A:101-02, pp. XVI-3 through 5. Uses of Gila River system water in excess of safe annual yield, made possible by overdrawing ground water basins, are not included in the figures in text.

[2]See Calif. Finding 4F:102, p. IV-55; parts XIV-H through XIV-L, pp. XIV-77 through 103.

[3]*E.g.*, Nev. Comments on Draft Report, dated June 6, 1960, pp. 10-13, 15, 24.

of Colorado River water,[4] but their consumptive use in 1956 was only 24,450 acre-feet.[5]

In 1944, the Secretary of the Interior executed a water delivery contract with the State of Nevada[6] (amending an earlier contract of 1942[7]) for delivery of certain quantities of water stored in Lake Mead.

There are also in Nevada certain minor federal establishments for which the Master has sustained United States claims for Colorado River water based on the federal reservations of the public lands.[8]

Nevada users also require about 51,000 acre-feet per annum from the Virgin River system, a lower basin tributary.[9]

C. Utah and New Mexico Projects

Existing projects in Utah and New Mexico require about 100,000 acre-feet from lower basin tributary systems.[10] (These two states have no access to the main Colorado River in the lower basin (see plate 11 *infra*).) New Mexico takes a minor portion of the safe annual yield of the Gila River system which is common to that state and Arizona.[11]

IV. INTERSTATE APPORTIONMENT PROPOSED BY THE CALIFORNIA DEFENDANTS OF THE DEPENDABLE LOWER BASIN WATER SUPPLY

A. The Evidence on Water Supply

The California evidence, closely corroborated by the Arizona evidence (except for one study by an Arizona witness based on a Compact interpretation supplied by Arizona counsel and later disowned by counsel[1]), clearly establishes that the dependable or permanent water supply available for consumptive use from the main Colorado River is approximately 6,000,000 acre-feet per annum.[2] That dependable supply requires an inflow at Lee Ferry of 8,700,000 acre-feet per annum, together with other usable lower basin tributary inflow, to meet Mexican Treaty deliveries and reservoir and other unavoidable river losses as well as consumptive use.[3] The dependable supply of all lower basin tributary systems is approximately 2,000,000 acre-feet per annum.[4] Thus, the dependable or permanent supply available for

---

[1]See Ariz. Ex. 358 (Tr. 18,097) and Tr. 21,840, discussed *infra* pp. 245-46 note 4.

[2]Calif. Findings and Conclusions, parts V-A through V-E, pp. V-3 through 33. The California evidence showed a net usable supply available to the lower basin from the main stream of 6,175,000 acre-feet per annum, reduced by a 5% safety factor to 5,850,000 acre-feet per annum (see Calif. Finding 5E:102, table, p. V-31). See also plate 8 *infra,* comparing various elements of water supply studies in evidence.

[3]Calif. Findings and Conclusions, parts V-D and V-E, pp. V-17 through 33; plate 7 *infra,* a schematic diagram of the California water supply study.

[4]Calif. Findings and Conclusions, parts V-G and V-H, pp. V-35 through 48, showing the safe annual yield from the Gila River system in Arizona and New Mexico of 1,750,000 acre-feet per annum; part V-I, p. V-49 (see also Calif. Finding 4F:102, p. IV-55), re other lower basin tributary systems (Little Colorado, Virgin, Kanab Creek, and Bill Williams river systems) showing a safe annual yield of 200,000 acre-feet per annum.

allocation for consumptive use in this suit is somewhat less than 8,000,000 acre-feet per annum from the entire lower basin, including both main stream and tributaries.[5]

B. Interstate Apportionment Proposed by California

The decision proposed by California would provide California three quarters of a million acre-feet less from the permanent supply of the main Colorado River than the quantity of water required by California's constructed projects. It would permit from that supply full future development of all existing Nevada projects and of all existing Arizona main stream projects except for 80,000 acre-feet per year.

Under the decision proposed by the California defendants, California claimed approximately 4,600,000 acre-feet per annum from the dependable or permanent supply of the main Colorado River.[6] Under the Seven-Party Agreement[7] (and ignoring small additional and senior federal claims for Indian reservations in California sustained by the Master),[8] that quantity would provide 3,850,000 acre-feet per annum to satisfy the first three priorities of the four California agricultural agencies (Palo Verde, Yuma, Imperial, and Coachella), or about 144,000 acre-feet less than those districts' combined consumptive use as of the date of the evidence

---

[5]The 8,000,000 acre-feet is a rounded quantity. The dependable main stream supply of 5,850,000 acre-feet per annum proposed in our findings is rounded up to 6,000,000 acre-feet per annum, and the dependable tributary supply of 1,950,000 acre-feet per annum is rounded up to 2,000,000 acre-feet.

[6]Calif. Findings and Conclusions, part XII, particularly table 2, p. XII-25; Calif. proposed decree (bound in vol. 1, Calif. Findings and Conclusions), table 1, p. Decree-10, at col. (7).

[7]Ariz. Ex. 27 (Tr. 242), discussed *supra* p. 14.

[8]*Supra* pp. 15-16.

(1955-1957).[9] That quantity would supply 750,000 acre-feet per annum under the fourth and fifth priorities for Metropolitan Water District,[10] or only 166,000 acre-feet more than Metropolitan's 1957 consumptive use,[1] and 462,000 acre-feet less than its 1,212,000 acre-feet of constructed capacity. California would be dependent, for the balance, on water temporarily available.

Under our proposed decree, Arizona would receive 1,129,500 acre-feet per annum from the dependable main stream supply, only 80,000 acre-feet less than the full ultimate requirements of her existing main stream projects.[2] Nevada would receive the full requirements of her existing main stream projects, 120,500 acre-feet, from the dependable main stream supply.[3]

In addition, Arizona would receive from the dependable or permanent supply of the Gila River system 1,715,000 acre-feet per annum, plus her use by existing projects of 82,500 acre-feet per annum from the dependable supply of other lower basin tributary systems.[4] Thus, Arizona would receive 2,927,000 acre-feet per annum from the dependable supply of the Colo-

---

[9]Rep. 128 shows that consumptive use in Coachella, Imperial, Palo Verde, and Yuma as of 1955-1957 was 3,994,392 acre-feet per annum, which is 144,392 acre-feet more than 3,850,000 acre-feet.

[10]4,600,000 acre-feet less 3,850,000 acre-feet for the first three priorities ahead of Metropolitan.

[1]Metropolitan's 1957 consumptive use was 584,000 acre-feet (Rep. 128 n.73). The district's present use is already more than 750,000 acre-feet per annum (appendix, pp. A35-36).

[2]Calif. Findings and Conclusions, part XII, particularly table 1, p. XII-24; Calif. proposed decree, table 1, p. Decree-10, cols. (7) and (8); *supra* pp. 16-17.

rado River *system* (main stream and tributaries) in the lower basin. Nevada would also receive her use by existing projects of 51,000 acre-feet per annum from the Virgin River system.[5] Thus, Nevada would receive 171,500 acre-feet per annum from the Colorado River *system* in the lower basin.

New Mexico and Utah would receive the full requirements of their existing projects from the dependable supply of the lower basin tributary systems in each state, 45,500 acre-feet per annum to New Mexico and 56,000 acre-feet per annum to Utah.[6]

C. The Master's Determinations on Water Supply

The Master asserts that the future supply of main stream water in the lower basin is irrelevant to the legal issues in this case (Rep. 99-102) and that the dependable or permanent supply of the main Colorado River is undetermined and undeterminable from the record (Rep. 102-13). (The Master does not mention the permanent supply of lower basin tributary systems.) These water supply questions, which are bound up closely with the resolution of the issues on the merits, are treated in the Argument, Part Five *infra* pp. 232-78.

D. California Motions re Water Supply

In our comments on the draft report, submitted to the Special Master on June 10, 1960, California moved,

---

[5]Calif. Findings and Conclusions, part XII, particularly table 3, p. XII-26; Calif. proposed decree, table 5, p. Decree-17; *supra* p. 19.

[6]Calif. Findings and Conclusions, part XII, particularly table 4, p. XII-27, showing New Mexico's allocations from the Gila and Little Colorado river systems, and table 5, p. XII-28, showing Utah's allocations from the Virgin River and Kanab Creek systems; Calif. proposed decree, table 6, p. Decree-18 (New Mexico) and table 7, p. Decree-[illegible] (Utah); *supra* p. 19.

inter alia, that the Master appoint or recommend that the Court appoint a disinterested expert or experts skilled in hydrology as the Court's own witness to testify (1) whether the dependable or permanent water supply available for consumptive use each year from the main Colorado River in the lower basin is determinable within reasonable and useful limits of accuracy and (2), if so, what that supply is.[7] The Master denied this motion.[8]

On August 31, 1960, the California defendants moved that the Special Master reopen the trial for the taking of evidence relating to depletion of the Colorado River at Lee Ferry by existing and anticipated projects in the upper basin. The motion was occasioned by the revelation during oral argument in New York City on August 19, 1960, that the Master believes that unused upper basin water (*i.e.,* water legally and physically available for use in the upper basin) will be available for use in the lower basin into the "foreseeable" and "unforeseeable" future.[9] This assumption of the Master was not disclosed by the draft report, although it is now discussed in the Master's final Report (Rep. 111-15).[10] The Master denied the motion (Rep. 112 n.41).

V. DECISION RECOMMENDED IN THE MASTER'S REPORT

The Master's Report and proposed decree recommend the following decision for this Court:

A. The "Mainstream" and "Tributary" Waters

The "mainstream" is defined as Lake Mead and the main Colorado River below Lake Mead within the United States, including the inflow from the Bill Williams River, and miscellaneous lesser tributary inflow (Rep. 183-85, Decree art. I(B) (Rep. 345)). The Bill Williams River enters the main Colorado River approximately 150 miles below Hoover Dam (see Rep. 33-34; map of Colorado River basin, plate 11 *infra*).

The "tributary" waters are all other lower basin waters; *i.e.,* the waters in all tributary systems in the lower basin as well as in the main Colorado River itself from Lee Ferry to Lake Mead. (Decree art. I(F) (Rep. 345-46).)

B. The "Mainstream" Allocation

1. *Basis of Water Rights*

The Report concludes that the Boulder Canyon Project Act nullified principles of priority and equitable apportionment which would otherwise control the interstate allocation of "mainstream" waters. Instead, the Project Act authorizes and directs the Secretary to allocate the "mainstream" waters among Arizona, California, and Nevada, the only three states having physical access thereto, by means of water delivery contracts authorized by section 5 of the act. This conclusion is based on the Master's construction of sections 1, 5, and 8(b) of the Project Act, and on legislative history. (Rep. 151-64.)

2. *The Limitation on California*

The Report construes the limitation on California's

consumptive use,[1] set forth in the first paragraph of section 4(a) of the Project Act and the reciprocal California Limitation Act (Rep. 164-65), as follows:

(1) The limitation on California's consumptive use to 4.4 million acre-feet of the "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact" makes an "inappropriate" reference to the Compact. It was intended by Congress to refer to 4.4 million acre-feet of the first 7.5 million acre-feet of consumptive use from the "mainstream" alone, although Article III(a) of the Compact relates to the first 7.5 million acre-feet of consumptive use from all Colorado River system waters (main Colorado River and all tributaries) in the lower basin. (Rep. 173-94; see also Rep. 142-44.)[2]

[1]The Master concludes that the limitation on California relates to consumptive use of "mainstream" water measured by the quantity of "mainstream" water diverted at points of diversion in California less return flow to the "mainstream," measured or estimated by appropriate engineering methods, available for use in the United States or in satisfaction of the Mexican Treaty obligation. (Rep. 185-94.)

[2]The Master's proposed construction of the limitation on California was first revealed in his Draft Report of May 5, 1960. In our Comments on the Draft Report (pp. 90-93), we moved that the Master reopen the hearings to take evidence on whether the limitation's reference to "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact" is controlled by whatever meaning is properly to be given to Article III(a) of the Colorado River Compact. The Master by letter directed the California defendants to submit at the time of oral argument in New York City an offer of proof in support of our motion which would serve as the basis for determining whether the hearing should be reopened (Tr. 22,600). Our offer of proof and brief in support thereof, dated August 17, 1960, and the California exhibits which constitute the evidence offered (now bound as vol. 25, Calif. Exhibits) were submitted to the Special Master and all parties on August 17, 1960. The Report concludes that "it would not be provident to reopen the hearings for the purpose of receiving [the exhibits submitted in California's offer of proof] as well as any evidence which might then be tendered by the other parties in contradiction." (Rep. 253; see Rep. 248-53.)

(2) The limitation on California's consumptive use to one half of any "excess or surplus waters unapportioned by said compact" does not refer to the Compact. It refers to one half of the consumptive use of "mainstream" waters over and above 7.5 million acre-feet although the Compact deals with all Colorado River system waters in the lower basin. (Rep. 194-200.)

The Report asserts that the limitation set forth in the first paragraph of section 4(a) cannot be read literally because Article III(a) in the Compact which is described as a "limitation on appropriative rights" cannot be identified with Article III(a) in the limitation which is described as "a source of supply." (Rep. 149.) The Report also asserts that the limitation cannot be read literally to refer to the Compact also because of provisions of a tri-state compact (never ratified) set forth in the second paragraph of section 4(a) which would render such a construction impractical and unreasonable (Rep. 170-72). Legislative history is also relied upon (Rep. 174-80). The Master also holds that if the limitation is read literally to refer to the Compact, the 1 million acre-foot increase in use permitted to the lower basin by Article III(b) of the Compact is not "excess or surplus waters unapportioned by said compact," and California could not acquire rights thereto (Rep. 150, 180 n.40, 194-96).

The Report reasons that Congress intended the limitation to refer to "mainstream" waters because these were the waters to be impounded and controlled by the United States with the dam and reservoir authorized by the Project Act (Rep. 173-74, 183). The "mainstream" waters include the inflow from the Bill Williams River (150 miles below Hoover Dam) because of

administrative difficulties in segregating its inflow from the other "mainstream" waters released from Lake Mead and because Congress treated that inflow as *de minimis* (Rep. 184-85).

3. *The "Contractual Allocation Scheme"*

The Report concludes that the Project Act vests in the Secretary of the Interior the discretion to determine the quantity of "mainstream" waters which he will make available each year for consumptive use in Arizona, California, and Nevada. This discretion is controlled only by the obligation to release water pursuant to the Mexican Treaty obligation, and to follow the priorities for the use of Hoover Dam and Lake Mead specified in section 6 of the Project Act (Rep. 221-22, 224, 305). The Master also concludes that "in view of the control of the mainstream vested in the Secretary of the Interior, he will in effect administer the decree" (Rep. 314).

The Report concludes that the water delivery contracts executed by the Secretary of the Interior with California public agencies (between 1930-1934), with Nevada (in 1942 and 1944), and with Arizona (in 1944) establish a "contractual allocation scheme (or system)" (Rep. 221, 232) which "forever allocates" all "mainstream" waters available for consumptive use[3] in these three states in the following manner (Rep. 221-28, 232-37, 305-14, Decree art. II(B) (Rep. 347-50)):

If there is 7,500,000 acre-feet of "mainstream" water available for consumptive use each year:

[3] "[D]iversions from the stream less such return flow thereto as is available for consumptive use in the United States or in satisfaction of the Mexican treaty obligation." Decree art. I(A) (Rep. 345).

To Arizona	2,800,000 acre-feet
To California	4,400,000 acre-feet
To Nevada	300,000 acre-feet

If there is less than 7,500,000 acre-feet of "mainstream" water available for consumptive use each year, the shortage is shared ratably by each state in proportion to its allocation:

By Arizona	28/75 (37⅓%)
By California	44/75 (58⅔%)
By Nevada	3/75 (4%)

However, section 6 of the Project Act requires that if the "mainstream" waters available for consumptive use in any year are insufficient to supply "present perfected rights" in one or two states, the allocations of the other states or state must be cut back proportionately to supply those rights. If the "mainstream" waters are insufficient to supply all "present perfected rights" in all three states, shortages are borne in inverse order of priority of such rights across state lines. "Present perfected rights" are defined as the quantity of water put to consumptive use by June 25, 1929, or reserved by the United States for federal reservations made prior to that date whether put to use by that date or not.

If there is excess "mainstream" water available for consumptive use in any year over and above the first 7,500,000 acre-feet:

To Arizona 50% (subject to a reduction to 46% in favor of Nevada if the Secretary should so contract with Nevada)

To California 50%

The foregoing apportionments are subjected by the Report to the following qualifications: Under the Proj-

ect Act, intrastate priorities control the distribution of a state's allocation within a state, but those priorities are not determined in this suit.[4] No water may be delivered to a user or for a use in violation of state law, or to any person without a water delivery contract, with certain exceptions for Indian reservations and other federal establishments operated by the Secretary of the Interior. The Secretary is permitted to release water apportioned but unused by one state for use in another state or states. (Rep. 312, 314, Decree arts. II(B)(7)-(8) and II(C)(1) (Rep. 349-50).) Neither the Report nor the recommended decree gives any instructions to the Secretary as to how water unused by one of the "mainstream" states shall be allocated by the Secretary if it is insufficient to satisfy competing demands of the two other "mainstream" states.

This "contractual allocation scheme" is "deduced" by the Master from the water delivery contracts construed with the gloss that the Secretary intended thereby to effectuate substantially, although not precisely, the allocation set forth in the second paragraph of section 4(a) of the Project Act (authorizing an interstate compact which no state ratified), in conjunction with the limitation specified in the first paragraph of that section (Rep. 222-25).

4. *Federal Reservations*

The Report adjudicates in the United States rights to "mainstream" waters, both as to quantities and priorities, based on federal reservations of public lands for

---

[4]Although the Report does determine priority dates of federal rights based on federal reservations, their relative priorities as against other users within a state are not determined. (Rep. 218-19.)

Indian reservations and for other federal purposes[5] (Rep. 254-304, Decree art. II(C)(2) (Rep. 350-53)).

The Report also concludes that the rights of the United States to the full quantities of "mainstream" waters reserved by the United States by June 25, 1929, for Indian reservations and for other federal establishments constitute "present perfected rights," regardless of any history of beneficial use or nonuse (Rep. 309-11), entitled to the protection which the Report accords to such rights (*supra* p. 29). The federal rights and uses are chargeable to those states in which the use is made, and the federal rights within each state are limited by the allocation to each state (Rep. 247-48, 300-02, 312-13, proviso to Decree art. II(C) (Rep. 353)).[6]

C. The "Tributary" Waters

1. *"Tributary" Users Inter Sese*

The Report determines that principles of equitable ap-

---

[5]Lake Mead National Recreation Area (Rep. 292-95) and Havasu and Imperial National Wildlife refuges (Rep. 296-300).

[6]California excepted to the Master's determinations of (1) the quantities of water reserved by the United States for Indian reservations (Rep. 254-87) and for other federal lands and purposes (Rep. 291-300), (2) the priorities accorded to such federal reservations, and (3) the bases upon which the Report predicates water rights for such federal reservations. (Calif. Exception IV-5, p. 25.) Although we disagree in principle with these determinations for the reasons summarized in our comments on the Master's draft report, pp. 45-53, we do not brief the point herein. First, the quantities of Indian water in dispute in California are relatively small. Second, the Master has correctly decided, as noted above, that federal uses in Arizona and Nevada are chargeable to those states out of water from which California users are excluded by the California Limitation Act, and the Master asserts that "all of the parties seem to agree to this accounting." (Rep. 247.) No party appears to have excepted to this conclusion. However, if the decision that federal uses are so chargeable should be attacked by any party in briefs, we reserve our challenge to the determinations which sustain the federal claims.

portionment continue to control the interstate allocation of "tributary" waters among users of those waters *inter sese* (Rep. 325). However, there is presently no justiciable controversy over the waters of any tributary system except the Gila River system waters which are used in New Mexico and Arizona (Rep. 322-25). This latter controversy among these two states and the United States is adjudicated (Rep. 325-43, Decree art. IV (Rep. 354-58)) under equitable apportionment principles (Rep. 325-28, 331) in conjunction with a minor stipulation between those two states (Rep. 329-30). No other "tributary" rights are adjudicated.

2. "Tributary" Users Vis-a-vis "Mainstream" Users

The Report determines that principles of equitable apportionment also continue to control interstate controversies between "tributary" users and "mainstream" users (Rep. 316-18; see also Rep. 247), but any waters reaching the "mainstream" are allocated among the "mainstream" users according to the formula earlier propounded (Rep. 317). It further determines that there is presently no justiciable controversy between "tributary" users and "mainstream" users, and, accordingly, no such rights are adjudicated (Rep. 318-21).

VI. EXCEPTIONS OF THE CALIFORNIA DEFENDANTS

The California defendants have excepted to the Report of the Special Master in the respects specified in our exceptions filed with this Court on February 27, 1961. This consolidated opening brief of all eight California defendants is filed in support of those exceptions.

SUMMARY OF THE ARGUMENT

Preliminary Statement

The Master proposes a resolution of this suit which is only obliquely related to the issues pleaded and litigated. The Master concludes that the issues which were brought by the parties to this Court, referred to the Master, and litigated during the course of three years of trial, are irrelevant to the disposition of the case. He concludes that the question which precipitated the suit is undeterminable: Is there a *dependable* water supply for the proposed Central Arizona Project?

The Master proposes a decree which, if adopted, will affect the construction of the Central Arizona Project in no perceivable way if Arizona and Congress decide to make diversions for that project from any of the planned alternative diversion points on the main Colorado River above Lake Mead (about 275 miles of the main stream of the Colorado River in the lower basin), newly defined by the Master as a "tributary," and excluded from this adjudication. If the Central Arizona Project should make diversions above Lake Mead (the 1960 Annual Report of the Arizona Interstate Stream Commission states that surveys for such diversions are now underway)[1] the Master's decision proposes that the principal protagonists begin anew in this Court. On the next trip, California as a "mainstream" user sues Arizona as a "tributary" user under the principles of priority of appropriation and equitable apportionment which the Report preserves for that future suit, but which are otherwise abolished by the Master in the "mainstream," defined by the Master as the Colorado River from Lake Mead to Mexico. This unattractive

[1]See p. 125 *infra*.

prospect results from the Master's divorcing the Project Act from the Colorado River Compact.

Arizona brought the present suit to quiet an asserted title to 3,800,000 acre-feet of consumptive use of the waters of the Colorado River system (*i.e.*, main stream and tributaries) in the lower basin. Arizona asserted, and all parties recognized, that Arizona's claim (alleged to include 1,700,000 acre-feet Arizona was not using), and the claims of California for existing and long-established projects, were mutually exclusive. California had built three projects at a cost in excess of a half billion dollars of public investment.

That controversy exists solely by reason of the Colorado River Compact. Were it not for the apportionment in perpetuity which the Compact makes to the upper basin of the consumptive use of 7,500,000 acre-feet per annum, there would be an adequate supply of unappropriated water available for Arizona's proposed Central Arizona Project without impinging on any rights or requirements of the other lower basin states.

Issues joined in the pleadings and the evidence taken during three years of trial related in large part to the pleaded and long-standing controversy over the meaning of the Compact as "enthroned" by the Boulder Canyon Project Act.[2] Major issues litigated were (1) the meaning and method of measurement of "beneficial consumptive use" under the Colorado River Compact as applied to lower basin tributaries; (2) Arizona's asserted identification of her uses on the Gila River sys-

[2]The Senate committee which reported the Boulder Canyon Project bill described it as "enthroning the Colorado River Compact." S. REP. No. 592, to accompany S. 728 (fourth Swing-Johnson bill), 70th Cong., 1st Sess., pt. 1, at 16 (1928). All of part 1 of the above report is in evidence as Calif. Ex. 203 (Tr. 7,715).

tem with the 1,000,000 acre-feet specified for the lower basin by Article III(b) of the Compact. Their significance lay in the fact that the Project Act had incorporated the Colorado River Compact; to what extent, therefore, must Arizona account for her uses on the tributaries against the 3,800,000 acre-feet which she sought? Her claim was based (1) on provisions of that act which had exacted from California a limitation on California's uses (duly enacted by the California Legislature), in the event that Arizona should fail to ratify the Compact, and (2) on a contract with the Secretary of the Interior.

The Master has resolved most of the pleaded and litigated issues relating to the Compact in accordance with California's contentions. Arizona's uses on the tributaries are encompassed by the Compact, and measured as California contended. He holds, however, that the Compact is not relevant to this controversy (Rep. 138): that the explicit incorporation of the Compact into the limitation on California must be excised: that the Compact includes the tributaries in the apportionment it makes to the lower basin, but the California Limitation Act and the Project Act exclude them (Rep. 173); that the Compact's apportionments in perpetuity to each basin are ceilings on appropriations (Rep. 140, 149): that there is nothing to show that the upper basin users will ever appropriate and use anything approaching the quantity of water within that ceiling (Rep. 111). He rejects California's offer to prove that the upper basin, by about the year 1990, will reach or approach the limits of its use physically possible consistent with the Compact (Rep. 112 n.41).

Upon the Master's reasoning, the Arizona and California claims are not mutually exclusive: "Existing California uses are in no danger of curtailment unless and until many vast new projects, some of which are not even contemplated at this time, are approved by Congress and constructed." (Rep. 115.) If there were sufficient water available upon application of the Master's formula to supply California's existing uses, there would necessarily be more water available to Arizona than Arizona sought in her Complaint.

The Master's decision generates two great unresolved paradoxes:

(1) It is neither possible nor necessary to determine the dependable water supply, if the Master's premises with respect to the Compact are correct. The upper basin's apportionment, except to the undetermined extent of existing upper basin appropriations, is no longer treated as an existing claim against the lower basin; the claims therefore do not exceed the supply; on these premises the controversy is not justiciable. But he concludes that it is justiciable. Although this is a jurisdictional issue, we postpone its treatment to Part Five of the Argument, since the relationship of the Compact (which the Master holds irrelevant) to the Project Act is at the heart of every substantive issue earlier considered.

(2) In 1928, the Arizona delegation in Congress unanimously, strenuously, and emphatically resisted the Boulder Canyon Project Act, and Arizona continued to do so in three suits in this Court, in Congress, and in every public forum available. In 1960, the Master discovered that, contrary to every contention earlier

made, the Project Act had in fact allocated to Arizona the lion's share of the stored water made available by the Boulder Canyon Project. This paradox is revealed only when the dependable water supply is determined. Absent such a determination, it is impossible to test the result accomplished by the Project Act against its legislative objectives.

I. INTRODUCTION: THE BASIS OF WATER RIGHTS

The source of California's water rights is the law of equitable apportionment and priority of appropriation confirmed, not abrogated, by the Project Act. Appropriation is the law of the arid West created by imperative necessity. That law is more firmly established in the Colorado River basin than anywhere else. This is not by accident, but because this is the area where water is most precious. See plate 1. California water users have initiated appropriations by licenses and permits to appropriate and by federal water contracts; they have diligently prosecuted construction of works to put those waters to beneficial use; and today great projects in California are beneficially using the water. Under the principles of equitable apportionment and priority of appropriation, California's projects have prior rights to the use of all water necessary to sustain them,[3] whether these rights are considered as derived from state or federal law, because federal statutes and state law embody identical principles.

[3]In Part Two we discuss the quantitative limitation imposed upon these rights by the statutory compact between the United States and California evidenced by the Boulder Canyon Project Act and the reciprocal California Limitation Act. This limitation did not destroy the priorities of these rights, but limited their magnitude to stated quantities.

There is no disagreement about the source and characteristics of water rights in the lower basin prior to June 25, 1929, the date upon which, by presidential proclamation, the Boulder Canyon Project Act, the Colorado River Compact (ratified by six states), and the California Limitation Act became simultaneously effective: The controlling law was equitable apportionment and priority of appropriation. Priority of appropriation, the principal ingredient of equitable apportionment, contains three fundamental elements: (1) Water rights are founded upon beneficial use of water and are lost by nonuse; (2) the water user prior in time is prior in right (the priority concept); (3) the water user who initiates an appropriative right and who diligently constructs a project to put the water to beneficial use is given a priority from the date of initiation of his project. This relation-back principle protects the diligent appropriator from losing his water supply before his project is completed to a water user whose project is later initiated but earlier completed. Equitable apportionment, applied consistently by this Court in interstate suits between states which internally apply principles of priority of appropriation, modifies priorities to the extent necessary to take equitable considerations into account; the primary respect in which priority of appropriation is thus modified is the protection of existing economies built upon interstate priorities which are junior. This Court has never countenanced the impairment or destruction of an existing economy, even though founded on junior interstate priorities, for the benefit of a project not yet built. (*Wyoming v. Colorado,* 259 U.S. 419 (1922); *Nebraska v. Wyoming,* 325 U.S. 589 (1945).) *A fortiori,* the Court has pro-

tected economies which are built on senior rights. Such is the California economy which is sustained by the Colorado River Aqueduct of The Metropolitan Water District of Southern California. This project would be the primary victim of the Special Master's recommended decree. (See pp. 260-61, 266-70, 272-76 *infra.*)

The Special Master concludes that the Boulder Canyon Project Act, by implication, destroyed the principles of priority of appropriation and equitable apportionment in the "mainstream" (the truncated main Colorado River as defined by the Report) and all water rights founded upon that law (excepting only certain narrowly defined "present perfected rights" existing in 1929), although (a) those principles survive and control water rights in every part of the Colorado River system in the lower basin except the "mainstream" and although (b) "mainstream" appropriative rights survive vestigially to permit senior "mainstream" users to vindicate their rights against upstream junior "tributary" users (including, as a "tributary," the main Colorado River above Lake Mead). (Rep. 316-18, 325.)

By thus abrogating on the "mainstream" the water law principles which have been settled in the West for a hundred years, and all interstate water rights depending upon those principles, the Master proposes, in 1961, to remit all existing projects and all future projects to a pro rata share of a water supply left undetermined and, according to the Master, undeterminable.

II. CONSTRUCTION OF THE LIMITATION ON CALIFORNIA'S RIGHTS

Our disagreement with the Special Master begins with the event which took place on June 25, 1929, when

the President's proclamation made simultaneously effective (1) the Boulder Canyon Project Act, (2) the California Limitation Act, and (3) the Colorado River Compact. There is agreement that prior to that date all rights of all states in the lower basin were based on the law of equitable apportionment and priority of appropriation. There is also agreement that the Boulder Canyon Project Act, section 4(a), first paragraph, together with the California Limitation Act placed limits on those rights in California. We sharply disagree with the interpretation the Special Master has placed upon that statutory limitation. We also sharply disagree that our rights within that quantitative limitation were at any time shorn of priority by the Project Act, the Limitation Act, or the Secretary's water delivery contracts.

In the California Limitation Act, California agreed to limit her uses of Colorado River waters in consideration of the passage of the Project Act, in response to Congress' specification of the terms of the agreement tendered in the first paragraph of section 4(a) of the Boulder Canyon Project Act. The specified limitation is that California should agree that her aggregate annual consumptive uses of Colorado River waters, including "all water necessary for the supply of any rights which may now exist," shall not exceed 4.4 million acre-feet of (1) the "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact," plus (2) not more than one half of any "excess or surplus waters unapportioned by said compact." The California Limitation Act, accepting that agreement, repeats the specified words virtually *in haec verba.*

Article III(a) of the Colorado River Compact apportions, from both the main stream and the tributaries of the Colorado River system, 7,500,000 acre-feet of beneficial consumptive use in perpetuity to each basin. The phrase "excess or surplus waters unapportioned" does not appear in the Compact, but Article III(a) of the Compact is the only Compact provision which in terms purports to apportion water between the basins. The issue has long been whether the 1,000,000 acre-feet of increase in beneficial uses permitted the lower basin in Article III(b) can be construed as an apportionment within the meaning of the limitation's phrase, "excess or surplus waters unapportioned." California has insisted that the waters specified in Article III(b) of the Compact are "excess or surplus waters unapportioned" and Arizona has insisted that they are "apportioned." This phrase clearly refers to the Compact although it is not clear which Compact classification is referenced. (See *infra* pp. 72-73, 107 note 9.)

The Master rewrites the words of the limitation agreement. He says that the words do not refer to the Colorado River Compact (which is irrelevant), nor to any of its provisions, nor to the main stream and the tributaries in the lower basin (Rep. 173):

> "Thus I hold that Section 4(a) of the Project Act and the California Limitation Act refer only to the water stored in Lake Mead and flowing in the mainstream below Hoover Dam,[4] despite the fact that Article III(a) of the Compact deals with

[4](Footnote ours.) Because of loss to nature's toll and the Mexican Treaty, 7,500,000 acre-feet of consumptive use from the truncated "mainstream" requires a flow of about 10,000,000 acre-feet to the lower basin at Lee Ferry. The California projection of net losses, including Mexican treaty requirements, below Lee Ferry is about 2.5 million acre-feet per annum. See plate 7 *infra*.

the Colorado River *System*, which is defined in Article II(a) as including the entire mainstream and the tributaries."

The Master holds that the words in the limitation are "shorthand" meaning "7,500,000 acre-feet per annum" (Rep. 173), a figure which does not appear in the limitation agreement, but which the Master holds must be derived from some source other than the Colorado River Compact. He regards as irrelevant the intention and the understanding of the California Legislature in agreeing to the limitation. But if the intention and understanding of the California Legislature were relevant, California must be conclusively presumed to have accepted the limitation interpreted as the Master now interprets it, although he concedes that this meaning contradicts the literal meaning of the offer to California.

The Master's proposal, he admits, is a patentable novelty.[5] It is entirely unsupported in the language of the statute, in the legislative history upon which the Master relies, and in 30 years of judicial, administrative, and practical construction of those words. It occurred to no one until after the trial in Arizona's fourth lawsuit over these documents had closed. The reference to the Colorado River Compact in the limitation was deliberate, rational, and purposeful. The limitation was insisted upon by the upper basin states to protect their apportionment under the Colorado River Compact and required by section 4(a) of the Project Act in the

[5]Referring to this construction, the Master conceded: "If we were issuing patents on it, I think we should have to claim novelty." (Tr. 22,762.) Novelty is a rewarded virtue in patent law; less can be said for it in construing a statute upon which whole economies have come to depend.

event, and only in the event, that Arizona did not ratify the Compact. The limitation, by restricting California's appropriative rights in the lower basin quantitatively, left a margin for exploitation by Arizona, thereby reducing the possibility that Arizona, unrestricted by the Colorado River Compact, would invade the upper basin's apportionment. The Compact purpose, by which Congress required a limitation only in consequence of Arizona's failure to ratify the Colorado River Compact, is defeated unless it is recognized that the law of the river is a seamless web: The words in Article III(a) of the Compact must have only one meaning, whether read in the Compact or read in the Project Act by specific incorporation. The quantitative difference between the two meanings which the Master discovers is 2 million acre-feet per annum, the magnitude of the lower basin supply which is consumed on the tributaries.

The Master's patentable novelty has these results:

(1) It permits the Master to resolve the major issues in a 30-year controversy related to the Compact in California's favor, and in accord with the Compact's express definitions, but to dismiss the Compact as irrelevant to anything to be here decided.

(2) It creates—if the upper basin's Compact apportionment is to be given any effect at all beyond the upper basin's present appropriations—a disparity between lower basin claims and supply far more severe than the worst drought which can be imagined. California's 4,400,000 acre-feet *and* the 3,100,000 acre-feet from which California is excluded must be satisfied, if at all, from the supply available from a newly created "mainstream" alone, and not—as the Compact would

dictate—from the Colorado and its tributaries in the lower basin. The utter impossibility of finding a permanent supply in the main stream adequate to sustain 7.5 million acre-feet of claims of the three states, undiminished by their uses on the tributaries, creates a shortage of some 2 million acre-feet, not by diminishing the main stream supply physically, as a drought would do, but by inflating the claims against that supply.

(3) It creates an entirely new river (the "mainstream"), in which water rights are on a basis of "sovereign parity"—a concept that states have equal priorities in unequal quantities of water—entirely different from water rights in the rest of the Colorado River system, except that equitable apportionment and priority are preserved as the basis and source of every "mainstream" right against the users on all of the tributaries which feed water to that river. How the two systems of rights can conceivably be adjudicated or administered together without total confusion is left unexplained, and we think no explanation is possible. The Court will be left with that problem as soon as a Central Arizona Project diversion from the Master's newly christened tributary above Lake Mead is again presented for federal authorization, or for construction as a nonfederal project. (See pp. 7 *supra* and 124-25 *infra.*)

The Master rewriting the limitation rests on inferences from the Project Act which no one discovered prior to the Master's draft report. It rests upon the Master's selection of legislative history, but the Master fails to disclose the two controlling facts:

(1) No member of Congress, even by remote inference, suggested that the Project Act created a "main-

stream" from Lake Mead to Mexico, with a separate basis for interstate water rights.

(2) Agreement has been universal that the Project Act is controlled by the Colorado River Compact in the unlikely event that any inconsistencies between the Project Act and the Compact might be discovered.

III. DESTRUCTION OF PRIORITIES BY A CONTRACTUAL ALLOCATION SCHEME

The shortage—or more accurately the disparity between the main stream supply and the claims against it which have been inflated by exempting the uses on the tributaries from the limitation accounting—is distributed by resort to a "contractual allocation scheme." This is deduced from the contracts which the Secretary has made for storage and delivery of water. The Master constructs a proration formula, undiscovered and undiscoverable from the Secretary's regulations or from any of the Secretary's contracts. California is to receive not 4,400,000 acre-feet, but 44/75 of an undetermined and undeterminable quantity. The numerator the Master finds in the one figure which appears in the limitation. The denominator is 7,500,000 acre-feet, but not found in the limitation nor (according to the Master) can it be taken from the Compact. It is derived from his interpretation of a tri-state compact which the Project Act authorized the states of Arizona, California, and Nevada to make, but which none ratified. Although the Master holds (correctly) that Congress neither imposed this apportionment on the states nor directed the Secretary to follow it, the Master concludes that the Secretary's contracts substantially effectuate that nuga-

tory tri-state compact. He strikes down as invalid, however, the Secretary's provisions in the Arizona and Nevada contracts which were placed there to make the accounting of these contracts conform to the Compact and limitation accounting; the Master's argument does not permit him to concede that the Colorado River Compact and the limitation accounting are compatible. The result he reaches, derived from this rejected tri-state compact, is even more unfavorable to California than that tri-state agreement would have been. (See pp. 224-25 *infra.*)

If the Master is wrong in rewriting the limitation to delete the incorporation of the Colorado River Compact, he cannot possibly find his "44/75" formula.

The converse is not necessarily true. Even if the Master could divorce the Compact from the limitation and substitute the newly invented "mainstream" for the Colorado River system, it does not follow, except by the discovery of "sovereign parity," that the shortage thus created ought to be prorated at all. We say that, subject to the quantitative limitation on California, shortages should be borne by application of the doctrine of equitable apportionment, including the principles of priority and protection of existing uses; section 8 of the Reclamation Act adopts those principles. (See pp. 147-52 *infra.*)

To reach the Master's proration result the Court must overrule its holding in *Arizona v. California,* 283 U.S. 423, 464 (1931) (expressly identified as such in the Court's opinion by Mr. Justice Brandeis), that the law of prior appropriation survived the enactment of the Project Act. The Court must override the express language of section 18 and section 14 of the Project

Act, and overrule *pro tanto* two decisions of this Court which have accorded section 8 of the Reclamation Act *interstate* effect. *Nebraska v. Wyoming,* 325 U.S. 589, 612-16 (1945); see *Wyoming v. Colorado,* 259 U.S. 419, 463-71 (1922). The Court must find that Congress delegated to the Secretary a power to make an interstate allocation of perpetual water rights, although members of Congress were virtually unanimous in their belief that Congress did not have that power to exercise by statute, much less to delegate to the Secretary of the Interior. (See *infra* pp. 146-47, 181-82, 186 note 1.)

If the Master is right that water supply will be abundant, the objective proposed by California presents no hazard to any existing project in any neighboring state, and it presents for a future project only the hazard that must be recognized and assumed by the sponsors of any new project anywhere in the West. The risk ought not to be cast upon projects which have become the basis of going economies, by the application of novel interpretations of the "law of the river" discovered 30 years too late.

IV. NONEXISTENCE OF THE MASTER'S CONTRACTUAL ALLOCATION SCHEME

The question of the validity of the Master's "contractual allocation scheme" is reached only if it is concluded (1) that the limitation must be rewritten to delete its incorporation of the Compact, and (2) that Congress validly delegated to the Secretary of the Interior the power to forever allocate water rights in the "mainstream," and (3) that he did so.

The "contractual allocation scheme" founders on the incontrovertible fact that no Secretary of the Interior

ever purported to make any such allocation. The contracts themselves contradict the existence of any such allocation. To find his allocation scheme, the Master not only rewrites the statutes, but he must also rewrite the contracts. Thus he excises from the contracts the clauses expressly reducing the Secretary's delivery obligations by reason of the contractees' uses above Lake Mead. (Rep. 237-47.) Even these excisions do not fit the contracts to the Procrustean bed. The very water delivery contracts relied upon by the Master to create the contractual allocation likewise expressly recognize the rights of New Mexico and Utah; the Arizona contract specifically recognizes "present perfected rights" —obviously as of 1944. These provisions must also be written out of the contracts to discover any correlation between the Master's "contractual allocation scheme" and the contracts as they were executed. (See pp. 201-03 *infra.*)

The Master assumes California agencies voluntarily accepted a "federal allocation" by entering contracts which were even harsher to California than the tri-state compact which California had refused to ratify.

Moreover, if any Secretary made any "allocation" to California, that allocation must be construed consistently with the limitation on California incorporating the Compact's systemwide concepts. So construed, the Secretary "allocated" to California 4,400,000 acre-feet per annum whenever the systemwide consumptive uses in the lower basin are 7,500,000 acre-feet per annum, and one half of any systemwide consumptive uses in excess of 7,500,000 acre-feet per annum, up to 962,000 acre-feet thereof.

In any event, and however the limitation is construed, the Secretarial "allocation" (if any) requires that shortages in "Article III(a) waters" shall be borne in inverse order of priority under the principles of priority of appropriation and equitable apportionment, thereby protecting California's existing projects. No contract purports to provide otherwise. (See pp. 211-31 *infra.*)

Very little could have been said in 1928, we think, in support of the Master's elaborate structure had it been proposed in Congress. Clearly any enthusiasm would have been limited to members of Congress from Arizona, who were in fact implacable in their opposition to the Project Act. Less can be said for it as an invention which bears the patent date of 1960.

V. WATER SUPPLY AND JUSTICIABILITY

The Master says that water supply cannot be determined within a margin of error which in fact is larger than the total quantity which Arizona in her Bill of Complaint claimed and described as unused.[6] If the Master is correct that the Colorado River Compact is (1) a ceiling on appropriations and (2) irrelevant, it is possible that water supply cannot be determined by anyone. If so, there is no justiciable controversy before the Court.

Much of what the Master says about the difficulties of determining water supply he ascribes to deficiencies in the science of hydrology and in the hydrologic data available. In fact, the data are better than those available to the Court in any prior case in which water supply was determined. Determination of water supply, we

[6]Rep. 104; Ariz. Complaint, par. XVII, p. 21.

believe, is jurisdictional. Moreover, without such a determination, a basic and compelling fact about the impact of the recommended decree is concealed. However "inappropriate" Congress' language may have been to achieve the result presumably intended, its intent with respect to specific projects was clear: It intended to make it possible to supply, in California, the All-American Canal, the Palo Verde Irrigation District, and The Metropolitan Water District of Southern California. This intent was recognized, affirmed, and asserted by both friend and foe of the Project Act. (See pp. 236-38 *infra.*)

That intent is not frustrated alone by supervening drought. We recognize fully that nature has already impaired the supply on which we relied. But the purpose intended by Congress could not have been achieved, if the Master reads it correctly, even if the full supply anticipated were available; the injury to California results from the Master's rewriting the applicable law and the water delivery contracts. In so doing, he relieves Arizona from the deductions which her pleadings conceded should be made from the quantities claimed under that state's contract with the Secretary, and awards Arizona substantially more water than those pleadings demanded.

The compelling inference from the facts of water supply, if they are developed, is that the Master has recommended a decision based on error. It is an error the consequences of which can only be described by the word "disaster."

We ask that the decree of this Court recognize that no limitation has been imposed on California restricting her to use less than 4,400,000 acre-feet per annum

of the waters apportioned to the lower basin states by Article III(a) of the Colorado River Compact from the main stream and the tributaries, plus one half of the excess or surplus waters unapportioned by that Compact. We ask that the appropriative priorities of our existing projects within that 4,400,000 acre-feet be protected, and that our rights in one half of the excess or surplus be recognized.

CONCLUSION

California does not ask that any water be required to run to the ocean unused. We do not ask to be relieved of any obligation which our state has fairly assumed. We ask a decision that will fully protect the rights and virtually all of the ultimate requirements of all existing projects in Arizona and Nevada competing with California for water from the main Colorado River.

ARGUMENT

PART ONE

INTRODUCTION TO THE ARGUMENT: EQUITABLE APPORTIONMENT AND PRIORITY OF APPROPRIATION AS THE FOUNDATION OF WATER RIGHTS

The Special Master's Report proposes, in one stroke, to abolish one hundred years of western water law in the "mainstream"[1] and to substitute in its stead a novel system of water rights. The system proposed by the Master is the antithesis of the law formerly applied to the "mainstream" and the law still to be applied to every other part of the Colorado River system in the lower basin.[2]

The law which would control the disposition of the controversy before the Court in the absence of the Colorado River Compact, the Boulder Canyon Project Act, and the California Limitation Act is not now in dispute. That controlling law is equitable apportionment and its primary ingredient, the principles of prior appropriation.[3]

California insists that those enactments recognize the continued vitality of those principles within the lower basin, except as California is expressly limited. The Master proposes to construe the Boulder Canyon Project Act to nullify unilaterally, without the assent of the states, equitable apportionment and the law of prior appropriation in the "mainstream" and to authorize the

[2]The main Colorado River between Lee Ferry and Lake Mead and all lower basin tributaries.

[3]Rep. 152, 316, 325-26.

creation of a unique system of water rights by the Secretary of the Interior through the execution of water delivery contracts which forever fix the allocations of "mainstream" water among California, Arizona, and Nevada regardless of beneficial use, nonuse, or existence of a project to use it. We say that the contracts of themselves create no interstate apportionment.[4] They are intended to administer a system under which "beneficial use shall be the basis, the measure, and the limit of the right,"[5] whether asserted intrastate or interstate, and whether the right so administered was initiated by an appropriation under state law or initiated by a federal contract for the use of stored water. However initiated—by state permit or license to appropriate or by federal contract—no intrastate or interstate water right is created unless, in the exercise of due diligence, a project is built to put the water to beneficial use, in which event the right relates back to the date of its initiation.

The Master's extraordinary proposal nullifies Congress' express command in the Project Act. It ignores the century of experience upon which western water law has been based. It overrules this Court's holding set down by Mr. Justice Brandeis which has been undisturbed for a generation. *Arizona v. California,* 283 U.S. 423, 464 (1931). It conflicts with the legislative

---

[4]In the alternative, we contend that if there were any contractual allocation scheme, the Master has misconstrued that scheme. See Argument *infra* pp. 195-231.

[5]The expression is from § 8 of the Reclamation Act of 1902, 32 Stat. 390, 43 U.S.C. §§ 372, 383 (1958), incorporated by reference in § 14 of the Boulder Canyon Project Act, 45 Stat. 1065, 43 U.S.C. § 617m (1958) (Rep. app. 394). Section 8 incorporates the relation-back principle and operates interstate. See Nebraska v. Wyoming, 325 U.S. 589, 612-14 (1945).

history of the Project Act and with the administrative, practical, and subsequent congressional construction of that act. It reverses the basis upon which development throughout the lower basin has proceeded for the last 30 years.

The extraordinary nature and the serious consequences of the Master's proposal to abolish the pre-existing law within the newly defined "mainstream" cannot be fully appreciated without considering the background and development of that law and its rationale.

1. *Principles of Western Water Law*

Western water law principles may be divided into two correlative and harmonious bodies of law: (a) The law of priority of appropriation applied internally by all of the western states[6] and adopted by the federal reclamation laws, with some modifications, and (b) equitable apportionment, the major ingredient of which is the law of prior appropriation, heretofore consistently applied by this Court in resolving western interstate water disputes.

2. *Principles of Priority of Appropriation*

The appropriative rights doctrine was conceived more than a century ago in response to these basic facts of life in western United States: Water is scarce. (See Rep. 16.) In these states, arable land and metropolitan centers are often widely separated from the water supply. Water must be brought to the land and to the people, often from great distances, by the construction of

[6]Modified riparian rights which still exist in California (Rep. 22) are quantitatively insignificant in this controversy.

elaborate diversion works, canals, and aqueducts.[7] Because existing streams are subject to erratic flows and floods,[8] regulation of stream flow by immense storage reservoirs is imperative.

Appropriative rights began in the mining camps of the Sierra Nevada in California.[9] At that time judges thought the choice of legal doctrines for the West was between what they assumed was the English common law of riparian rights and a new system based on priority of beneficial use. The new system was chosen, first in the mining camps, and later state by state throughout the West. The riparian doctrine,[10] developed in humid climates at a time when streams were important mainly as a means of transportation instead of

---

[7]"Because of the topography and geography of the region, Colorado River water can feasibly and economically be utilized only by the construction of great projects consisting of dams, pumping facilities, desilting basins, canals and other works, the cost of which is enormous." (Rep. 133.)

[8]This is true not only of the Colorado River system (Rep. 20, 115, 117, 119-22), but of many other western streams, such as the Laramie, equitably apportioned by this Court in Wyoming v. Colorado, 259 U.S. 419, 486 (1922), the Cache la Poudre, analyzed in that case, *id.* at 475, and the North Platte, equitably apportioned by this Court in Nebraska v. Wyoming, 325 U.S. 589, 598 n.7 (1945). See comparisons of flow fluctuations of these streams and the Colorado River in plates 4, 5, and 6.

[9]Irwin v. Phillips, 5 Cal. 140 (1855); Conger v. Weaver, 6 Cal. 548 (1856).

[10]The riparian doctrine has three fundamental principles which are directly contrary to the law of appropriation. First, water may be used only by a riparian landowner, on riparian land, within the natural drainage basin of the stream from which it is taken. No similar restriction exists on appropriative rights, developed where export of water to site of use is a recognized necessity. Second, the riparian right is neither acquired by use nor lost by nonuse. In this respect it is the antithesis of the appropriative right. Third, the riparian right is correlative, with the consequence that a water user who had built a project 50 years ago and had used the water ever since would be forced to share, in abundance or scarcity, with the proprietor of a new project initiated tomorrow. This is likewise the antithesis of the appropriative doctrine that "first in time is first in right."

a resource essential for survival, failed utterly to meet the vastly different conditions in the arid West. The Master invites the Court to take a giant leap backward by reinstating the proration principle of the repudiated riparian doctrine and abrogating the priority principle of the appropriative doctrine.

Mr. Justice Stone, in an earlier suit between Arizona and California, aptly described the principles of appropriation:[1]

> "Under this doctrine, diversion and application of water to a beneficial use constitute an appropriation, and entitle the appropriator to a continuing right to use the water, to the extent of the appropriation, but not beyond that reasonably required and actually used. The appropriator first in time is prior in right over others upon the same stream, and the right, when perfected by use, is deemed effective from the time the purpose to make the appropriation is definitely formed and actual work upon the project is begun, or from the time statutory requirements of notice of the proposed appropriation are complied with, provided the work is carried to completion and the water is applied to a beneficial use with reasonable diligence. See Arizona v. California, supra [283 U.S. 423, 429 (1931)]; Kansas v. Colorado, 206 U.S. 46; Wyoming v. Colorado, 259 U.S. 419."

Three principles provide the cornerstones of the appropriative rights doctrine: (a) Beneficial use is "the basis, the measure, and the limit of the right,"[2] (b)

[1]Arizona v. California, 298 U.S. 558, 565-66 (1936).

[2]Reclamation Act § 8, 32 Stat. 390, 43 U.S.C. §§ 372, 383 (1958), incorporated in the Project Act by §§ 12 and 14 of the latter statute.

the earlier beneficial user is protected against a later user by the principle of first in time, prior in right, and (c) one who has properly initiated an appropriative right and who diligently pursues the construction of works to enable him to use the water, is entitled to a water right upon completion of his works with a priority dated back to his first initiation of the right for the full magnitude of the project he has built (the relation-back principle).

Thus the first fundamental is that a water right depends on beneficial use and is lost by nonuse. Where water is scarce, beneficial use must always be the basic criterion for a water right.

The second fundamental is the doctrine of priority: One who first initiates a project to put water to beneficial use and proceeds thereafter with due diligence has priority over later users. If there is a water shortage, that shortage is not shared equally by all persons with water rights on the same stream. Users cut back their use in inverse order of the priorities established by dates of initiation of the respective rights. The priority principle, rather than parity, has remained the basic element of western water law because it is the only principle, as experience has proved, which meets the needs of the West. There are several reasons for this.

In bringing land and water together, the investment of time and money—often great quantities of both[3]—

[3]The Master recognizes these facts (Rep. 133, 239), but fails to recognize that the water rights system he proposes dictates the failure of the very projects he realizes must be protected, unless the supply becomes very much greater than has been ex-

is required. The third fundamental, the relation-back principle, operating concomitantly with the priority principle, constitutes the only legal machinery yet devised which provides sufficient security to encourage, indeed to permit, the necessary investment. Under this doctrine the investor is protected against some risks, and other risks are calculable. He is relieved, under the priority doctrine and the relation-back principle, from yielding his place on the stream to a user who begins his use during the time the earlier appropriator has his project diligently under construction.[4] He is protected from cutbacks in his supply by the acts of other men. Furthermore, he is insulated to some extent from shortages due to natural diminution of supply. At the time he wishes to undertake construction of a project the risks of supply under the prior appropriation doctrine are calculable. Dependable supply in a stream can be determined within reasonable limits of accuracy. The investor can thus ascertain in advance, within those limits, by determining the dependable supply and existing appropria-

perienced in the last 50 years. (See *infra* pp. 255-56, 260-61.) Nevertheless, he considers water supply irrelevant (Rep. 99). If so, the Colorado River is the only river west of the 100th meridian on which projects and their water rights are immune to the relevance of this fact of life.

[4]*E.g.*, the city of Los Angeles first made surveys initiating the Colorado River Aqueduct in 1923 (Rep. 65); appropriations of water for the project were initiated by that city in 1924 (Calif. Exs. 419 and 419-A (Tr. 9,395)) and by the city of San Diego in 1926 (Calif. Exs. 436, 437, and 437-A (Tr. 9,395)). Metropolitan, as successor to the city of Los Angeles and in furtherance of the project, executed water delivery contracts with the Secretary of the Interior in 1930 (Ariz. Ex. 38, Tr. 251) and in 1931 (Ariz. Ex. 39, Tr. 252). Metropolitan's was the first water delivery contract executed by the Secretary of the Interior. The project, at all times diligently pursued, was completed in 1960—almost 40 years after it was initiated. (See Rep. 69 and appendix, pp. A25-36.)

tive rights on the stream, how much of the dependable supply is unappropriated and will be available to his project.[5] If parity (a basic ingredient of riparianism and the essence of the Master's formula allocation) is substituted for priority, no investor can evaluate the risks to which his project will be subject. Every user's water supply is always vulnerable to displacement or diminution by later users, the number of whom and the quantity of whose use are unknown and unknowable.[6]

The priority doctrine discourages building projects in excess of the reasonably dependable supply. Overbuilding creates disaster. When risks are calculable,

---

[5]The Master recognizes that "[T]he cost of such projects is enormous, and they can be financed only if a relatively constant and dependable supply of water seems likely to be available once they are completed. Similarly, existing projects cannot be economically operated unless a dependable supply of water is available" (Rep. 239). He nevertheless rejects the hydrological evidence presented to the Court ("[It] simply does not permit a prediction of future Lower Basin supply with that refined degree of accuracy necessary to show whether existing California uses can be satisfied from the percentage of future supply apportioned to California. On the contrary, the mass of evidence which has been presented shows only that the science of hydrology is not capable of sustaining a prediction accurate enough to shed light on this question", Rep. 103). But he does not explain how Congress, necessarily relying upon hydrological studies, will be able to make that determination usefully, whereas the Court cannot. In fact, hydrological studies are constantly used as the criteria upon which "such projects" are financed and built. The Master likewise overlooks the fact that great projects are financed and built not only by Congress, but by state and local private enterprise using their own financing.

[6]See Yeo v. Tweedy, 34 N.M. 611, 620, 286 Pac. 970, 974 (1929): "The exercise of those rights which have been in abeyance will frequently destroy or impair existing improvements, and may so reduce the rights of all that none are longer of practical value, and that the whole district is reduced to a condition of nonproductiveness. The preventive for such unfortunate and uneconomic results is found in the recognition of the superior rights of prior appropriators."

projects for which the risks clearly exceed the possible return are usually not built. But if the risks are undefined and undefinable, marginal projects are built. By the parity principle, both the prudent and the profligate share in disaster, which destroys the usefulness of the resource for all.[7]

Today, after more than a century of experience, eight western states recognize and apply priority of appropriation as the sole and exclusive basis of water rights: New Mexico, Arizona, Nevada, Utah, Colorado, Wyoming, Montana, and Idaho. The populated areas of these eight states are the most arid in the United States. Six of the eight are states of the Colorado River basin. In nine other states, water laws are a combination of appropriation and riparian rights: Washington, Oregon, and California on the Pacific Coast, and a tier of states on the 100th meridian east of the continental divide: North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, and Texas. The climate of these nine states, in terms of average annual precipitation, is not as dry as that of the eight strictly appropriation states. It is drier (except for the Pacific Coast north of San Francisco and some of the mountainous regions) than the United States to the east of the tier on the 100th meridian. East of the 100th meridian the riparian doctrine has prevailed

[7] "Crops cannot be grown on expectations of average flows which do not come, nor on recollections of unusual flows which have passed down the stream in prior years. Only when the water is actually applied does the soil respond." Wyoming v. Colorado, 259 U.S. 419, 476 (1922).

except as recently modified by statute.[8] The accompanying map (plate 1) illustrates the relationship between average annual precipitation and water law doctrines.

Courts early accorded recognition to the appropriation doctrine across state lines.[9] Mr. Justice Holmes said that appropriations must be effective across state

---

[8]Today, mounting water use is bringing water shortages to regions of the United States long regarded as regions of water plenty. Under the impact of this experience, some of the traditionally riparian eastern states have already turned to the principles of appropriation. See Ziegler, *Statutory Regulation of Water Resources* in WATER RESOURCES AND THE LAW 89, 91-111 (1958), prepared by Legislative Research Center, University of Michigan Law School, for discussion of the statutes enacted in Mississippi (MISS. LAWS 1956, ch. 164), Iowa (IOWA LAWS 1957, ch. 229), and Florida (FLA. LAWS 1957, ch. 57-380). Other states are considering this change as well: *E.g.,* South Carolina, North Carolina, Arkansas, Wisconsin, and Michigan. See Fisher, *Western Experience and Eastern Appropriation Proposals* in THE CONSERVATION FOUNDATION, LAW OF WATER ALLOCATION IN THE EASTERN STATES 75, 90 (Haber & Bergen eds. 1958). It has also been suggested that the most satisfactory plan for the solution of water problems in Georgia would be the adoption of some form of the law of prior appropriation. INSTITUTE OF LAW AND GOVERNMENT OF THE SCHOOL OF LAW, UNIVERSITY OF GEORGIA, A STUDY OF THE RIPARIAN AND PRIOR APPROPRIATION DOCTRINES OF WATER LAW 106 (1955). The Model Water Use Act, prepared for the eastern states and approved by the National Conference of Commissioners on Uniform State Laws in August 1958 moves toward appropriation principles. The act provides both for loss of rights by nonuse (§ 306) and protection of existing uses (§ 303). By contrast, no state which has adopted the priority principle has abandoned it, nor has abandonment been seriously proposed.

[9]The first reported case involving that problem was Howell v. Johnson, 89 Fed. 556 (C.C.D. Mont. 1898). The Montana court there upheld the right of a downstream senior appropriator in Wyoming against the claim of an upstream junior appropriator in Montana. Five years later, in Willey v. Decker, 11 Wyo. 496, 73 Pac. 210 (1903), the Wyoming Supreme Court, in one of the most comprehensive reviews of the origins of appropriation in the western United States found in judicial decisions, concluded that imperative necessity, which gave birth to the doctrine, required its extraterritorial recognition.

lines because a state "cannot be presumed to be intent on suicide."[1]

3. *Federal Recognition of Appropriation Principles*

Congress recognized and adopted by statutes dating from 1866 the water laws of the western states.[2] The Desert Land Act of 1877 requires that the desert land entryman prove a valid appropriative right under state law, and absent proof of such a right, an entry cannot be permitted or a patent issued under the act.[3] Congressional adoption of the basic ingredients of appropriative rights is manifested in the Reclamation Act of 1902,[4] the foundation act upon which the entire complex of federal reclamation laws has been built, including the Boulder Canyon Project Act which is a supplement to the reclamation laws.[5] Section 8 of the 1902 act provides:[6]

[1]Bean v. Morris, 221 U.S. 485, 487 (1911). See state and federal cases applying the law of appropriation across state lines collected in Wyoming v. Colorado, 259 U.S. 419, 470-71 (1922). See also Weiland v. Pioneer Irr. Co., 259 U.S. 498 (1922).

[2]*E.g.*, see United States v. Fallbrook Pub. Util. Dist., 165 F. Supp. 806, 841-42 (S.D. Cal. 1958): "There is an almost unbroken line of statutes by which Congress has deferred to state laws concerning water. They . . . begin with the Act of July 26, 1866, and run through . . . the Colorado Storage Project Act of 1956." A line of 25 statutes is cited at 841 n.1. The texts of 36 such statutes are set out in appendix B to our rebuttal brief before the Special Master, dated June 30, 1959.

[3]Desert Land Act § 1, 19 Stat. 377 (1877), as amended, 43 U.S.C. § 321 (1958). Lands in Imperial and Palo Verde districts have been patented, both before and since the Project Act, on proof of appropriations of Colorado River water. (See appendix, pp. A5-6 and A10-11.)

[4]Act of June 17, 1902, ch. 1093, 32 Stat. 388, as amended (codified in scattered sections of 43 U.S.C.).

[5]Section 14 of the Project Act (Rep. app. 394) expressly so declares; § 12 of the same act defines "reclamation law" in terms of the 1902 act and acts amendatory thereof and supplemental thereto. (Rep. app. 392.)

[6]32 Stat. 390, 43 U.S.C. §§ 372, 383 (1958).

"That nothing in this Act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this Act, shall proceed in conformity with such laws, and [nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof]:[7] *Provided,* That the right to the use of water acquired under the provision of this Act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right."[1]

The rationale and purpose of the congressional recognition has been forcefully stated by this Court:[2]

"The rule generally recognized throughout the states . . . of the arid region was that the acquisition of water by prior appropriation for a beneficial use was entitled to protection . . . . The rule was evidenced not alone by legislation

---

[7](Footnote and brackets ours.) The bracketed phrase indicates Congress' intent that § 8 should not affect the then pending case of Kansas v. Colorado, 185 U.S. 125 (1902). See Wyoming v. Colorado, 259 U.S. 419, 463 (1922).

[1]Section 8 was given interstate effect in Nebraska v. Wyoming, 325 U.S. 589, 612-15 (1945). See Wyoming v. Colorado, 259 U.S. 419, 463-71 (1922).

[2]California Ore. Power Co. v. Beaver Portland Cement Co., 295 U.S. 142, 154, 157 (1935). See also United States v. Gerlach Live Stock Co., 339 U.S. 725, 746 (1950); Wyoming v. Colorado, 259 U.S. 419, 459 (1922).

and judicial decision, but by local and customary law and usage as well.

". . . .

". . . . [I]t had become evident to Congress, as it had to the inhabitants, that the future growth and well-being of the entire region depended upon a complete adherence to the rule of appropriation . . . ."

4. *Equitable Apportionment Doctrine*

The law applied by this Court in interstate water disputes is known as "equitable apportionment." The word "equitable" in that phrase is a word of art developed in interstate water litigation. It is not a word of loosely defined content which requires the Court to dispense water rights with neither legal criteria nor guideposts. The Court has rightly rejected such a role and has defined the rules which it will apply in making an equitable apportionment of interstate waters. Between states which apply internally the law of prior appropriation, that law provides the basic ingredient of equitable apportionment. Mr. Justice Cardozo, in *Washington v. Oregon,* 297 U.S. 517 (1936), stated the essence of the inquiry in suits over water rights between appropriation states as follows (*id.* at 526):

"The question remains whether the Oregon irrigators as a result of all their acts are taking to themselves more than their equitable proportion of the waters of the river, priority of appropriation being the basis of division."

Although "priority of appropriation is the guiding

principle"[3] in an equitable apportionment suit, it is not the sole criterion:[4]

> "[A]ll the factors which create equities in favor of one state or the other must be weighed as of the date when the controversy is mooted."

As the Master correctly observes (Rep. 326):

> "It is worthy of note that the Court, in an equitable apportionment suit, has never reduced junior upstream existing uses by rigid application of priority of appropriation. Indeed, the tendency has been to protect existing uses wherever possible."

A fortiori, water is never reserved for future uses when the supply is inadequate to meet the requirements of prior appropriation by existing projects. (Rep. 326-27, 331.)

Congress was repeatedly told during the debates on the third and fourth Swing-Johnson (Boulder Canyon Project) bills, both in the House and in the Senate, that the rule of water law in the arid West was the prior appropriation doctrine.[5] Congress also knew that the appropriation doctrine applied across state lines under the decision of this Court in *Wyoming v. Colorado,* 259

[5]*E.g.*, 68 CONG. REC. 2653-54 (1927) (Rep. Taylor of Colorado); *id.* at 3065 (Rep. Leatherwood of Utah); *id.* at 3273 (Rep. Lea of California); *id.* at 3294 (Rep. Winter of Wyoming); *id.* at 4291-92 (Sen. Johnson of California); *id.* at 4412 (Sen. Pittman) 69 CONG. REC. 9763-64 (1928) (Rep. Taylor); 70 CONG. REC. 233, 235-37 (1928) (Sen. Johnson); *id.* at 327 (Sen. Bratton of New Mexico); *id.* at 391-92 (Sen. Borah of Idaho); *id.* at 461 (Sen. Hayden of Arizona).

U.S. 419 (1922).[6] Section 8 of the Reclamation Act of 1902, conferring federal blessing upon the principles of prior appropriation, was likewise called to Congress' attention as an integral part of the Project Act.[7]

If Congress had intended to abrogate, change, or modify what it knew was the settled existing law, the inference is inescapable that it would have expressed itself clearly on that subject. That intention does not appear in the Project Act expressly and it cannot be fairly implied. On the contrary, the Project Act expressly preserves equitable apportionment and priority principles, except to the extent that those principles have been qualified by valid interstate agreement, and this Court has so held. *Arizona v. California,* 283 U.S. 423, 464 (1931); *United States v. Arizona,* 295 U.S. 174, 183 (1935). (See *infra* pp. 140-45.)

The foregoing principles have been qualified by two interstate agreements: (1) the Colorado River Compact, which makes an apportionment in perpetuity to each basin and thus supplants preexisting law in respect of those apportionments basin versus basin, and (2) the California Limitation Act and the first paragraph of

section 4(a) of the Project Act, which together constitute an intersovereign compact imposing a quantitative ceiling upon California's uses of waters of the Colorado River.[8] But within the framework established by the Colorado River Compact and by the quantitative ceiling of the limitation upon California, the principles of equitable apportionment and priority of appropriation still control the intrastate and interstate apportionment of the waters of the entire Colorado River system in the lower basin including the "mainstream."

We do not contend, as the Master suggests we contend, that the limitation creates any water rights in California. (See Rep. 231.) It is a limitation, not a grant. Our rights are based upon (1) preexisting appropriations, referred to as "rights which may now exist" in both the limitation and in Article III(a) of the Compact, and (2) principles of priority of appropriation and equitable apportionment adopted and applied in the federal water storage and delivery contracts (*infra* pp. 174-75). The limitation, like the Colorado River Compact, includes "all water necessary for the supply of any rights which may now exist" in explicit recognition of the preexisting rights.

Water delivery contracts executed pursuant to the Boulder Canyon Project Act, like water delivery contracts executed pursuant to other parts of the reclamation law, are not substitutes for interstate compacts.

---

[8]"Rights which may now exist," the phrase used in both Article III(a) of the Colorado River Compact and the Limitation Act, refers to appropriative rights, unless we are to conclude that the words are meaningless; no other rights existed (except those for federal establishments and a few riparian landowners in California).

Water delivery contracts are essential working parts of the administration of reclamation projects in all of the 17 western states and are a familiar device in every such project. Water delivery contracts neither supplant nor modify equitable apportionment and priority principles.[9]

Rejecting both western experience and history, the Master concludes that Congress intended in the Project Act to destroy utterly every fundamental principle of western water law in the "mainstream" (saving only those portions of appropriative rights represented by uses thereunder prior to 1929) and to substitute in its place a system of water rights which, in every respect, is its antithesis: parity replaces priority, water rights are neither created by beneficial use nor lost by nonuse, relation back is abolished.

We shall examine the judicial decisions, the statutory language, the legislative history, and the administrative, practical, and congressional construction which confirm the continued vitality of these principles of western water law within the lower basin. Under those principles, there can be no doubt that California's rights for her existing projects are superior to the claims of Arizona and Nevada for new projects, as yet neither built nor authorized.

The starting point of our disagreement with the Master is his novel construction of the limitation on California, more harsh to California and more generous to Arizona than any decision for which Arizona contended in her pleadings in this case or any of its predecessors.

---

[9]The purpose and effect of water delivery contracts are explained *infra* pp. 169-75.

PART TWO

THE INTERPRETATION OF THE LIMITATION ON CALIFORNIA, PROPOSED IN THE BOULDER CANYON PROJECT ACT AND ACCEPTED IN THE CALIFORNIA LIMITATION ACT, IS CONTROLLED BY THE MEANING OF THE COLORADO RIVER COMPACT EXPRESSLY INCORPORATED BY REFERENCE IN BOTH STATUTES

Statement of the Issue

The resolution of a pivotal issue in this case turns on the construction of a very few words which appear in almost identical form in two statutes: the Boulder Canyon Project Act, first paragraph of section 4(a),[1] and the California Limitation Act.[2] Those words, identified here by italics and brackets in their context in the Project Act, are as follows (Rep. app. 382):

> "California . . . shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this Act, that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the [1]

---

[1] 45 Stat. 1058 (1928), 43 U.S.C. § 617c (1958) (Rep. app. 381-82).

[2] CALIF. STATS. 1929, ch. 16, p. 38 (Rep. app. No. 4).

waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any [2] *excess or surplus waters unapportioned by said compact,* said uses always to be subject to the terms of said compact."

California did agree in the California Limitation Act, repeating this language substantially *in haec verba.* (Rep. app. No. 4.)

The limitation expressly incorporates the Compact by reference. That incorporation poses two distinct questions of interpretation: (1) To what provisions of the Compact does each phrase refer? The intention of Congress and of the legislatures of California and the other basin states[3] determines the answer. (2) What is the meaning of the Compact provisions referenced in each phrase? The meaning of the Compact controls the answer.

To both questions, the Master's response is that the Compact is irrelevant (Rep. 138) and is not incorporated by reference (Rep. 173):

> "I have concluded that Congress intended, in limiting California to 4.4 million acre-feet of 'the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact,' simply to limit California's annual uses of water to 4.4 out of 7.5 million acre-feet. Con-

[3]Congress specified the limitation in the Project Act (first paragraph of § 4(a)); California adopted the limitation in the California Limitation Act, and six basin states (excepting Arizona) accepted the limitation as the basis for six-state ratification of the Compact either by enacting such ratification or by forbearing to repeal earlier ratification. (See Rep. 24-27.) The importance of this consensual character of the limitation is explained *infra* pp. 128-37.

gress referred to Article III(a) of the Compact solely as a shorthand way of saying '7,500,000 acre-feet per annum.' This inappropriate reference to the Compact has been the cause of seeming inconsistency in the Act and of much confusion in its interpretation. Reflection has led to the conviction that the statutory language does not accurately express the true congressional intention.

"Thus I hold that Section 4(a) of the Project Act and the California Limitation Act refer only to the water stored in Lake Mead and flowing in the mainstream below Hoover Dam, despite the fact that Article III(a) of the Compact deals with the Colorado River *System,* which is defined in Article II(a) as including the entire mainstream and the tributaries."

Phrase 1: The reference to Article III(a) of the Compact

Phrase [1] directs the reader to Article III(a) of the Compact, which provides:

"(a) There is hereby apportioned from the Colorado River System[4] in perpetuity to the Upper Basin and to the Lower Basin,[5] respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include

[4](Footnote ours.) "Colorado River System" as used in the Compact means "that portion of the Colorado River and its tributaries within the United States of America" (Art. II(a), Rep. app. 372).

[5](Footnote ours.) "Lower Basin" means "those parts of the States of Arizona, California, Nevada, New Mexico, and Utah within and from which waters naturally drain into the Colorado River System below Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the System below Lee Ferry" (Art. II(g), Rep. app. 372).

all water necessary for the supply of any rights which may now exist."

The Special Master correctly construes this "unmistakable language" (Rep. 143) of the Compact to refer to all Colorado River system waters, both from the main Colorado River and its tributaries, in the lower basin, and not just to "mainstream" waters in Lake Mead and below (Rep. 142-44, 173). It follows, therefore, that unless the plain language of phrase [1] is to be disregarded, it incorporates this meaning from the Compact.[6]

Phrase 2: The reference to "excess or surplus waters unapportioned" by the Compact

The Compact reference intended by phrase [2], a phrase which does not appear in the Compact, is not so clear. Of the component words in that phrase, "excess" never appears in the Compact, "surplus" only in Article III(c)[7] and "unapportioned" only in Article

---

[6]California does not contend that the provisions of the Compact are operative, *ex proprio vigore,* to control the disposition of this case. California contends that the Project Act and the California Limitation Act adopt the Compact definitions as their own, and apply these definitions, as components of federal and state statutes, to the disposition of the case. The Master, for the most part, adopts California's interpretations of the Compact and rejects Arizona's, but declines to give any effect to the limitation's references to the Compact, howsoever construed.

[7]Article III(c) provides (Rep. app. 373):

"If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River System, such waters shall be supplied first from the *waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b)* [of Article III]; and if *such surplus* shall prove insufficient for this purpose, then, the burden of such deficiency shall be equally borne by the Upper Basin and the Lower Basin, and whenever necessary the States of the Upper Division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d)." (Emphasis and bracketed words added.)

III(f).[8] The question is whether Congress and the legislatures of California and of the other basin states intended by phrase [2], "excess or surplus waters unapportioned by said compact," to refer, *inter alia,* to the waters specified in Article III(b) of the Compact. (*Cf.* Rep. 168-69, 197.) Article III(b) provides (Rep. app. 373):

> "In addition to the apportionment in paragraph (a) [of Article III], the Lower Basin is hereby given the right to increase its beneficial consumptive use of such waters by one million acre-feet per annum." (Bracketed words added.)

The Master agrees that Article III(b), like Article III(a), refers to all Colorado River system waters in the lower basin, not merely to waters from the "mainstream" (Rep. 147, 150). However, the Master asserts that if phrase [2] is read literally California cannot share in Article III(b) waters. (*E.g.,* Rep. 150-51, 168-69, 194-96.) The Master nevertheless concludes, by recourse to Senate debates, that Congress intended the "excess or surplus" accounting to begin when there is more water available for consumptive use than the 7.5 million acre-feet of "Article III(a) water." Congress did not intend to exclude California completely from the next million acre-feet (Rep. 194-200). We contend that a sound and literal reading of phrase [2], "excess or surplus waters unapportioned by said com-

---

[8]Article III(f) provides (Rep. app. 374):

"Further equitable apportionment of the beneficial uses of the *waters of the Colorado River System unapportioned by paragraphs (a), (b), and (c)* [of Article III] may be made in the manner provided in paragraph (g) at any time after October first, 1963, if and when either Basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b)." (Emphasis and bracketed words added.)

pact," also achieves that result and permits California to share in those III(b) waters. (*Infra* pp. 106-10.)

Significance of the Issue

Our difference with the Special Master over the meaning of the limitation may be stated in several ways:

In terms of statutory construction

In its simplest form, and yet the form which most precisely identifies the major legal issue, our difference with the Master can be reduced to an astonishingly simple question: *Do the words "Colorado River compact" and "said compact" in section 4(a) of the Project Act and in the Limitation Act mean the Colorado River Compact?* The Master concludes that they do not. Until the Master so held, there had never, in the last 30 years of Colorado River history and controversy, been the slightest suggestion that such was the case. Indeed, Arizona, even now, contends that Compact and Project Act should be harmonized by the view that Congress modified the Compact.[9]

If it is decided that "Colorado River compact" and "said compact" mean the Colorado River Compact, the construction of phrase [1], the "III(a) issue," is concluded in our favor by the Master's Report. (Rep. 142-44, 173; discussed *supra* pp. 71-72.)

In terms of the usefulness of the decision

This litigation was initiated by Complaint of Arizona to quiet an asserted title to water of the Colorado River system and for the express purpose of securing a dependable water supply for the proposed Central Arizona Project. (Rep. 30-31, 130-31.) Alternative diversion points on the main Colorado River were considered for

[9]See Ariz. Exceptions, pp. 7-8.

that project: Bridge or Marble Canyon above Lake Mead, or Parker Dam below Lake Mead. (*Supra* p. 7.) The decision that the limitation on California does not refer to the Colorado River Compact, or to Compact categories of water, but exclusively to waters from the "mainstream" (Lake Mead to the Mexican border) is the basis of the recommended decree which would leave all rights above Lake Mead unadjudicated. Unless Arizona chooses a diversion route from below Lake Mead, the decree has nothing to do with water for the Central Arizona Project. The Master leaves rights above Lake Mead to adjudication by future suit to which principles of equitable apportionment shall apply. (Rep. 316-21.)

In quantitative terms

As to the 7.5 million acre-feet referred to in phrase [1]:[1] Is California limited to 4.4 million acre-feet of the first 7.5 million acre-feet of annual consumptive use from the entire Colorado River system, main stream and tributaries, in the lower Colorado River basin (as we say), or to 4.4 million acre-feet of the first 7.5 million acre-feet of consumptive use from that segment of the Colorado River which the Master calls "mainstream," *i.e.,* from Lake Mead and below?

Conversely, as to the 3.1 million acre-feet (7.5 million minus 4.4 million) from which California is excluded: Must that quantity be claimed by the other four lower basin states (Arizona, Nevada, New Mexico, and Utah) from the entire Colorado River system in the lower basin (as we say), or may it be claimed in its entirety from the "mainstream," in competition with California's

[1]The Master agrees that the quantity referred to is 7.5 million acre-feet, but leaves to complicated exegesis the discovery of where the figure 7.5 comes from, if not from the Compact. The limitation does not use the figure.

4.4 million, by the two lower basin states having geographic access thereto (Arizona and Nevada), undiminished by their uses on the "tributaries," including the main stem from Lee Ferry to Lake Mead?

As to the "excess or surplus" referred to in phrase [2]: Is California limited to annual consumptive use of one half of "excess or surplus" over and above that 7,500,000 acre-feet of consumptive use from the entire Colorado River system, main stream and tributaries, in the lower basin (as we say), or to one half of "excess or surplus" over and above the first 7,500,000 acre-feet of consumptive use from the "mainstream"?

Conversely, as to the one half of "excess or surplus" from which California is excluded: Must that half be claimed by the other four lower basin states from the entire Colorado River system in the lower basin (as we say), or may it be claimed in its entirety from the "mainstream" by Arizona (and perhaps Nevada)?

The practical consequences of the resolution of this issue turn upon the Special Master's identification of the waters from which California is excluded. The Master holds that under the Project Act the claims against those waters from which we are excluded must be satisfied wholly from the "mainstream" and not, as we contend, from the Colorado River system (the main Colorado River and tributaries) within the lower basin as defined in the Colorado River Compact. The consequences are readily demonstrable:

None of the parties contend that there will not be sufficient water throughout the Colorado River *sys-*

tem in the lower basin to sustain permanently the consumptive use of at least 7.5 million acre-feet annually. Of this, the permanently dependable supply in the tributaries now supports about 2 million acre-feet per annum of consumptive use, and the permanently dependable supply in the Colorado River from Lee Ferry to the Mexican boundary can probably support a beneficial consumptive use of not less than 5.5 million acre-feet per annum.[2]

Therefore, if the emphasized words identified by the bracketed number [1] relate to Colorado River *system* water throughout the lower basin, the permanently dependable supply is adequate to sustain California's use of at least 4.4 million acre-feet per annum, as well as the consumptive use of 3.1 million acre-feet by the other lower basin states: Arizona, Nevada, New Mexico, and Utah.

Whenever *system* supply in the lower basin will support beneficial consumptive uses exceeding 7.5 million acre-feet per annum, there is "excess or surplus" which California may use in satisfaction of her appropriations to the limit of one half.

However, the Report's interpretation of the words identified by the bracketed number [1] limits the waters referred to therein to that segment of the Colorado River system which the Report labels "mainstream." This interpretation makes it impossible to satisfy permanently 7.5 million acre-feet of consumptive use from such waters because the permanently dependable supply of the "mainstream," so defined, available for consumptive use in the lower basin is sub-

[2]See *supra* pp. 20-21.

stantially less than 7.5 million.[3] This interpretation also creates the shortage which the Master prorates. (See Part Three *infra* pp. 138-94 and Part Four *infra* pp. 211-31.)

If some 2 million acre-feet of consumptive use which is now sustained by the permanently dependable supply of the tributaries in the lower basin is eliminated from the limitation accounting, as the Report would do, the dependable "mainstream" supply, considered alone, contains no "excess or surplus." This makes inoperative, for all practical purposes, the provision of section 4(a) which permits California to use up to one half of "excess or surplus waters unapportioned by said compact."

In terms of other issues

Are principles of equitable apportionment and priority of appropriation replaced by a "contractual allocation scheme" divesting interstate priorities (except for "present perfected rights") of "mainstream" users *inter*

---

[3]"With the storage provided by Lake Mead, and barring a drought unprecedented in the recorded history of the River, the Lower Basin has, under the guarantee of the Compact, available for use at Hoover Dam a minimum of 7,500,000 acre-feet of water per year, less transit losses between Lee Ferry and the dam, evaporation loss from Lake Mead, and its share of the Mexican treaty obligation." (Rep. 144-45.) When minimum figures are substituted for the deductions specified by the Master and for similar losses below Hoover Dam which the Report properly characterizes as a further diminution of supply (Rep. 187), this is a "guarantee" under the Compact of less than 6 million acre-feet per year of consumptive use from the "mainstream." (See plates 7 and 8 *infra* and explanatory note preceding plate 7.)

To satisfy 7.5 million acre-feet of beneficial consumptive use from the "mainstream" in Arizona, Nevada, and California, there must be a supply (*i.e.* flow) of at least 10 million acre-feet of water annually in the "mainstream," because of requirements of the Mexican Water Treaty and of unavoidable losses. The supply which can actually be expected on a permanent basis does not exceed 8.7 million acre-feet of flow. See *supra* p. 41 note 4 and *infra* tables 7 and 8.

sese? Water rights from the main stream above Lake Mead and from the lower basin tributaries rest on equitable apportionment, and not on contracts to store and deliver from Lake Mead. (Rep. 316-21.) The limitation on California is the cornerstone of the Master's "contractual allocation scheme." Its essential premise is that the figure "7,500,000 acre-feet" which the Master agrees must be found in the limitation itself,[4] must be identified with 7,500,000 acre-feet from the "mainstream" and not the 7,500,000 acre-feet from the Colorado River system to which Article III(a) of the Compact refers.

The Master's "contractual allocation scheme" collapses if the 7,500,000 acre-feet referred to by the limitation is the 7,500,000 acre-feet from main stream and tributaries, to which he agrees Article III(a) of the Compact in fact refers (Rep. 142-44). (See Part Four *infra* pp. 206-11.)

In conceptual terms

Is the offer which Congress made to California in the Project Act, and which California accepted in its Limitation Act as the basis for six-state ratification of the Colorado River Compact, to be construed as a compact between these sovereigns in accordance with its plain and literal language, or is it to be construed solely as a federal statute and then its natural and literal meaning emasculated by reference to only the ambiguous part of the legislative history?

---

[4] "Congress referred to Article III(a) of the Compact solely as a shorthand way of saying '7,500,000 acre-feet per annum.'" (Rep. 173.)

I. THE SPECIAL MASTER'S CONCLUSION THAT SECTION 4(a) CANNOT BE READ LITERALLY IS WRONG

The Master's rejection of the limitation's express reference to the Compact begins with his conclusion that "the words of Section 4(a) . . . *cannot* bear their literal meaning." (Rep. 170; emphasis added.) The results which the Master perceives in a literal reading "would fly in the face of what must have been the congressional intention" and "would make no practical sense whatsoever" (Rep. 172). It is only after the Master thereby renders useless the express language of the limitation that he turns to construction by inference in contradiction of its natural and literal meaning. (See Rep. 173.)

None of the Master's reasons for rejecting the precise terms of the limitation are sound.

A. There Is No Distinction Between Article III(a) as Used in the Compact and Article III(a) as Used in the Project Act

In his explanation of the meaning of the Colorado River Compact, the Special Master discovers a distinction—previously unperceived by all parties during this litigation or the prior controversy—between Article III(a) as used in the Project Act and Article III(a) as used in the Colorado River Compact. The Master's distinction, if we understand it, is this: The limitation on California speaks of the "*waters* apportioned to the lower basin States" by Article III(a) of the Compact. (Emphasis added.) This is Project Act III(a), which the Master describes as a "source of supply." But Compact III(a) is asserted to be not a source of supply but

a "limitation on appropriative rights." Therefore, the Master concludes, there is Article III(a) *water* only "in the Project Act sense" (a source of supply), but not "in the Compact sense" (a limitation on appropriative rights).[5]

The Master's supposed dichotomy is unreal.

Both the Compact and the limitation refer, identically, to a quantity of water necessary to supply 7.5 million acre-feet of consumptive use annually.[6] This identity follows from the use of the same language and

---

[5]Rep. 149:

"As the foregoing discussion indicates, I regard Article III(a) and (b) as a limitation on appropriative rights and not as a source of supply. So far as the Compact is concerned, Lower Basin supply stems from Article III(c) and (d). There are, of course, other sources of supply, for example, Lower Basin tributary inflow, but these are not dealt with as supply items in the Compact. Thus when referring to the Compact, it is accurate to speak of III(c) and III(d) water, but it is inaccurate and indeed meaningless to speak of III(a) and III(b) water. For Compact purposes, Article III(a) and (b) can refer only to limits on appropriations, not to the supply of water itself.

"It is true that Congress in Section 4(a) of the Project Act, treated Article III(a) as a source of supply rather than as a limitation on appropriations. The Act speaks of 'the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact . . . .' Later in this Report I shall develop at some length the meaning of this language and the confusion it has produced in this litigation. Suffice it now to say that the congressional meaning is different from the Compact meaning. One may properly speak of III(a) water in the Project Act sense, but not in the Compact sense. Much of the confusion in this case may be traced to this difference between the two writings, for the parties speak of III(a) water without differentiating between the Compact and the Project Act."

The Master's statement that lower basin tributary inflows "are not dealt with as supply items in the Compact" conflicts with his correct conclusion that beneficial consumptive use from the tributary supply is accountable under Article III(a) and (b) of the Compact (Rep. 142-44).

[6]Since the limitation takes its meaning from the Compact, both refer to Colorado River system water.

the same concepts in both documents.[7] Article III(a) of the Compact provides that "there is hereby apportioned . . . the exclusive beneficial consumptive use of 7,500,000 acre-feet of *water* per annum . . . ." The Compact's Article III(a) apportionment includes "all *water* necessary for the supply of any rights which may now exist." The limitation on California includes in precisely identical words: "all *water* necessary for the supply of any rights which may now exist." The Master agrees that the term "beneficial consumptive use" in Article III(a) of the Compact and the term "aggregate annual consumptive use (diversions less returns to the river)" in the limitation both mean "diversions less returns to the stream" (Rep. 147-49, 185-87). (All emphasis added.)

Many other provisions of the Compact in addition to Article III(a) make clear the Compact's intention in Article III(a) to specify a *quantity of water* available for beneficial consumptive use. Article I states that a major purpose of the Compact is to provide for the "apportionment of the use of the *waters* of the Colorado River System . . . ." Article III(c) refers to the "*waters* which are surplus over and above the aggregate of the *quantities* specified in paragraphs (a) and (b)" of Article III. Article III(f) speaks of "the *waters* of the Colorado River System unapportioned by paragraphs (a), (b), and (c)" of Article III. Article

---

[7] If the Master is correct that the Compact's apportionment in perpetuity is merely a "limitation on appropriative rights" (Rep. 149), then it is identical to the limitation on California's appropriative rights. See Rep. 231: "The first paragraph of Section 4(a) is a limitation on California, not a grant to her . . . ." *Compare* Rep. 139-41 re the purpose of the Compact *with* Rep. 165-66 re the purpose of the limitation on California.

VIII provides that all rights to system waters other than present perfected rights shall be satisfied solely from "the *water* apportioned to that Basin in which they are situate." (All emphasis added.) If the Master were correct, the Compact would be hopelessly self-contradictory. (*Cf.* Rep. 195-96.)

Not even the Special Master is able to apply consistently the supposed dichotomy. In his discussion of California's rights to "tributary" waters under equitable apportionment principles, the Master states (Rep. 316-17):

> "With respect to California, *Section 4(a) is concerned with consumption and not with supply* and therefore does not affect any rights of that state to demand that tributary water be permitted to flow into the mainstream." (Emphasis added.)

Furthermore, articles II(B)(5), (6), and (8) of the recommended decree speak of "*water* apportioned for consumptive use" (Rep. 348-49). Decree article II (B)(8) also speaks of releasing "apportioned but unused *water* . . . for consumptive use" (Rep. 349). Do these provisions refer to a "limitation on appropriative rights" or a "source of supply"? Earlier in his Report, the Master answers this question when he states that "the recommended decree apportions water in those terms," *i.e.*, "in terms of consumptive use (diversions from the mainstream less return flow thereto)." (Rep. 126.)

We agree with the Master that there is a vitally important distinction between "supply" (meaning the quantity of water flowing at a particular point, as in Compact Article III(d)), and "consumptive use" (meaning the quantity of water diverted less the quan-

tity returning to the stream system, as in Compact Article III(a)). About 8,700,000 acre-feet of "supply"—flow from Hoover Dam—is required to produce about 6,000,000 acre-feet of "use"—diversions less returns to the stream—below Hoover Dam, and hence this distinction between supply and use is essential to avoid total confusion. (See plate *7 infra.*) The Special Master, in a single paragraph, eliminates that confusion which has existed on this point for 30 years when he explains why Compact III(a) and III(d) cannot be correlative.[8] This distinction between supply and use, however, is wholly unrelated to the dichotomy created by the Special Master which, if uncorrected, will create even greater confusion for at least another generation for those seeking this evanescent distinction between Compact III(a) and Project Act III(a). Both mean the quantity of water necessary to sustain 7.5 million acre-feet of consumptive use per annum. Both refer to the same 7.5 million acre-feet of systemwide lower

---

[8]Rep. 144:

"Lastly, Arizona argues that Article III(a) relates to the mainstream only because III(a) and III(d) are correlative, III(d) being III(a) multiplied by ten, and Article III(d) is clearly a mainstream measurement. This argument is unacceptable. Since Article III(a) imposes a limit upon appropriation whereas III(d) deals with supply at Lee Ferry, an interpretation which makes these two provisions correlative one to another is inadmissible. Since a substantial quantity of water is lost through reservoir evaporation and channel losses as it flows from Lee Ferry, the point where the III(d) obligation is measured, to the diversion points downstream from Hoover Dam, where most of the appropriations are made, 7,500,000 acre-feet of water at Lee Ferry will supply a considerably smaller amount of appropriations below Hoover Dam. Moreover, III(a) extends to appropriations on Lower Basin tributaries as well as the mainstream. Such appropriations cannot possibly have any relation to the quantitative measurement of the flow of water at Lee Ferry."

basin consumptive use, from main stream *and* tributaries.

Thus, (1) the Project Act, (2) the Limitation Act, (3) the Compact, and (4) the Master's Report and recommended decree are all consistent and uniformly use the word "water" to refer to the water necessary to supply the consumptive uses in the quantities stated.

B. A Natural and Literal Reading of the Limitation's Reference to the Compact Does Not Produce the Irrational and Unfair Results Discovered by the Master

The Master asserts that a "literal interpretation" of section 4(a) "would make no practical sense whatsoever" (Rep. 172) because it would divest Utah's and New Mexico's lower basin uses, exclude the upper basin from surplus, and prohibit the use in California of waters which would otherwise go to waste. In each instance, the Master portrays a "literal" interpretation which is not truly literal but which would produce an irrational or unfair result; because of that result, he then rejects the "literal" interpretation.

The results which the Master perceives do not flow from a reasonable reading of the natural and literal language of the limitation.

1. *Utah and New Mexico Would Not Be Excluded From All Lower Basin Uses*

The Special Master asserts that section 4(a) of the Project Act, read literally, authorizes a tri-state compact among Arizona, California, and Nevada which would divide among these three states all of the Colorado River system waters in the lower basin; thus, Utah and New Mexico would be deprived of any lower basin system waters, including the lower basin tributary waters which are now being consumed in those states

and which were being consumed therein as of 1928. (Rep. 170-71.) The Master concludes that "the unlikelihood of such a congressional intention indicates that Section 4(a) should not be given its literal meaning." (Rep. 171.)[9]

New Mexico and Utah would not be and could not be excluded from the use of any water by any compact among Arizona, California, and Nevada.[1] Neither the authorization nor the ratification of any interstate compact could affect the rights of the states not parties to it. The difficulty which compels the Master to rewrite the limitation was dispelled by this Court in *Arizona v. California,* 283 U.S. 423, 462 (1931): "As Arizona has

---

[9]This literal reading of § 4(a) by the Master conflicts with his "literal" construction of the limitation in the first paragraph. Since § 4(a) deals only with the "waters apportioned" by Article III(a) and "excess or surplus waters," the proposed tri-state compact in § 4(a) could dispose of *all* lower basin waters only if the Article III(b) waters are included in the "excess or surplus." The Master elsewhere frequently asserts that if the limitation is read literally California is excluded from Article III(b) waters which are not "excess or surplus." (Rep. 150, 168-69, 180 n.40, 194-95.) If so, would not the whole million acre-feet be available for appropriation by New Mexico and Utah as well as by Arizona and Nevada? This inconsistency demonstrates our contention that the Master strains the literal reading to achieve inequitable results and then rejects the express and specific reference in the limitation to the Compact in order to avoid the inequitable results created only by his strained reading.

[1]The Master rejects his own argument by construing Articles III(a) and III(b) of the Colorado River Compact as limitations on appropriative rights (Rep. 149). So also as to the reference to California in the first paragraph of § 4(a) (Rep. 231). If he is correct, then clauses (1) and (2) of the abortive tri-state compact set forth in the second paragraph of § 4(a) of the Project Act, which name Arizona and Nevada, can also be no more than a limitation on their appropriative rights. California was surely not expected to sign a tri-state compact which amounted to a limitation on her but a grant to her rivals. The tri-state compact thus could not dispose of New Mexico's and Utah's water rights. It could only be a reciprocally imposed limitation on the appropriations of each of the three parties as against the other two parties.

made no such [interstate] agreement, the [Boulder Canyon Project] Act leaves its legal rights unimpaired."

If compacting states could effectively abridge the rights of noncompacting states, the upper basin would not have been concerned over Arizona's refusal to ratify the Compact. Yet this concern clearly existed[2] and was, as the Master recognizes, the motivating force for the limitation on California.[3]

The Master points out that Senator (now Judge) Bratton of New Mexico was "one of the principal architects of Section 4(a)" of the Project Act. The Master considers it "preposterous" that section 4(a) would divest all of New Mexico's lower basin rights with the active support of Senator Bratton. (Rep. 175.)[4] The answer is simple: Senator Bratton must have believed—correctly—that clauses (1) and (2) of the tri-state compact to which New Mexico was not a party could not affect her rights. Otherwise clause (3), which insured Arizona the "exclusive beneficial consumptive use of the

---

[2]Rep. 22, 139, 165. See, *e.g., Hearings on H.R. 6251 and H.R. 9826 Before the House Committee on Irrigation and Reclamation*, 69th Cong., 1st Sess. (1926) at 95-112 (testimony of S. G. Hopkins, Interstate Stream Commissioner for Wyoming), and 120, 135-219 (testimony of Delph E. Carpenter, Interstate Rivers Commissioner for Colorado); H.R. REP. No. 1657, 69th Cong., 2d Sess., pt. 2, at 4 (1927) (minority views of Mr. Leatherwood of Utah).

[3]Rep. 165: "The Upper Basin feared that Arizona might not ratify, in which event California, unless limited, would be able to appropriate from the mainstream substantially all of the Lower Basin apportionment, *leaving Arizona free to make further appropriations from the mainstream outside the Compact ceilings.*" (Emphasis added.)

[4]Senator Bratton announced that he was going to vote against the Hayden amendment to authorize this specific tri-state compact, even though it had been made permissive, not mandatory; he thought the states should be free to negotiate their own terms, without any suggestions from Congress. 70 CONG. REC. 470-71 (1928).

Gila River and its tributaries within the boundaries of said State,"[5] would also cut off existing New Mexico rights. Senator Bratton, as an upper basin Senator, must have recognized that the Colorado River Compact could not affect the rights of Arizona unless she ratified the Compact. Therefore, Senator Bratton, as a lower basin Senator, must surely have recognized that a tri-state compact could not affect the rights of New Mexico which would not ratify that compact. It is only the contrary assumption—that a group of states may deprive another state of water rights without its consent —that creates the Master's dilemma: Either Senator Bratton failed to comprehend the plain meaning of the language used, or he was wantonly neglectful of New Mexico's interests. The choices are equally preposterous.

Indeed, no one has ever suggested that the La Plata River Compact, a two-state compact dividing the waters of that Colorado River tributary, had any effect upon the rights of the other five states having an interest in the Colorado River.[6]

The tri-state compact, authorized by the second para-

---

[5]Whatever else this language encompasses, it includes water which rises in Arizona Gila tributaries before these enter New Mexico. The San Francisco River is an example. Gila finding of fact 2, Rep. 336.

[6]The La Plata River Compact divided the flow between Colorado and New Mexico. This compact was negotiated in 1922 by Delph E. Carpenter of Colorado and Stephen B. Davis of New Mexico, both of whom were negotiators and signatories of the Colorado River Compact. The La Plata River Compact was signed at Santa Fe three days after the signing of the Colorado River Compact in that city; it was ratified by both states in 1923 and consented to by Congress in 1925 (43 Stat. 796 (1925)). The La Plata River Compact is reconfirmed and approved in article X of the Upper Colorado River Basin Compact (Ariz. Ex. 2 (Tr. 216)) consented to by Congress in 1949 (63 Stat. 31).

graph of section 4(a), would have been the most curious interstate compact ever negotiated. Although three states would have been signatories, it made an apportionment of water to only two of them—Arizona and Nevada. Furthermore, the failure to provide any water for any other state could not have been filled in by implication from the limitation on California, even assuming that the limitation could be converted to a grant. The limitation provision in the first paragraph of section 4(a) was required only in the event of Arizona's failure to ratify the Colorado River Compact. The tri-state compact was expressly conditioned (see clause (7)) on Arizona, California, and Nevada all ratifying the Colorado River Compact. It was *never* contemplated that the tri-state compact and the limitation on California would coexist.

However the language of the second paragraph is read, the acre-feet of the *limitation* specified in the first paragraph cannot be added to the acre-feet of the hypothetical *grant* specified in the second paragraph to Arizona and Nevada only. Consequently, if a tri-state compact had been entered into in the very words of section 4(a), second paragraph, and even if this gave 3.1 million acre-feet to Arizona and Nevada and one half of "excess or surplus" to Arizona, there would be a residue of 4.4 million acre-feet of III(a) water and one half of the "excess or surplus" available for use in California, New Mexico, and Utah. Since, as the Master points out, the first paragraph operates only as a limitation and not as a grant to California (Rep. 231), it cannot exclude New Mexico and Utah from sharing in this residue with California. The Master cannot have his argument both ways.

The conclusive effect which the Master attributes to the failure of the tri-state compact expressly to provide for New Mexico and Utah is incongruous in view of the quantity of water involved. The quantity of water necessary to supply the combined 1928 uses of New Mexico and Utah was insignificant. Their total annual consumptive use over the 1914-1945 period averaged less than 75,000 acre-feet.[7] In contrast, in deducing his "contractual allocation scheme," the Master treats as *de minimis* the inflow from the Bill Williams River (Rep. 184) involving more water than required for those combined New Mexico and Utah uses.[8]

Article 7(g) of the Arizona 1944 contract (Rep. app. 402) expressly recognizes the rights of New Mexico and Utah to equitable shares of the water apportioned to the lower basin by the Compact and of the waters unapportioned by the Compact, and is expressly without prejudice to those rights. Although Arizona now contends that this provision of her contract is invalid (Rep. 201-02), the Master declares the contract to be valid and binding except for article 7(d) (Rep. 207, 237-47). Article 7(g) constitutes an important administrative construction by the Secretary as well as a practical construction by Arizona that the lower basin rights of New Mexico and Utah are relevant to, and unimpaired by, the Project Act. This construction is reinforced by the Secretary's report on the proposed

---

[7]Ariz. Ex. 77 (Tr. 3,787), table S4, at 13, cols. 5 (for New Mexico) and 6 (for Utah).

[8]Average annual Bill Williams inflow of 75,000 acre-feet was reported to Congress. See Calif. Ex. 26 (Tr. 4,972), table 6; *Hearings on S. 728 and S. 1274 Before the Senate Committee on Irrigation and Reclamation,* 70th Cong., 1st Sess. 508 (table 6) (1928). See Rep. 121 for historic inflow of Bill Williams River for 1914-1951 period, averaging 117,800 acre-feet per annum.

Central Arizona Project which he submitted to Congress in 1949. The Secretary, pursuant to interpretations then advanced by Arizona, deducted from Arizona's share of the Colorado River system waters 130,000 acre-feet for combined Utah and New Mexico lower basin uses, in accord with Arizona's contract.[1]

2. *Upper Basin Would Not Be Excluded From Surplus*

The Master asserts that section 4(a), read literally, authorizes a compact which would "prohibit" upper basin states from using any of the surplus waters in the Colorado River basin (Rep. 171). The Master asserts that it is unlikely, particularly in view of Article III(f) of the Compact, that Congress intended to authorize Arizona and California to divide these waters between themselves and to leave nothing for the upper basin beyond its Article III(a) apportionment (Rep. 172). The Master concludes, therefore, that the limitation cannot be read literally to refer to the Compact.

For all of the reasons noted above in connection with lower basin rights of New Mexico and Utah, the upper basin would not and could not be excluded from the use of any water by any compact among Arizona, California, and Nevada.

Furthermore, the quantity of water which the upper states must let pass Lee Ferry to Lake Mead is controlled, not by the tri-state compact (however construed), but by the Colorado River Compact. The tri-state compact provides that it "shall be subject in all particulars" to the Colorado River Compact (clause (6),

[1]See Ariz. Ex. 71 (Tr. 310), at 151.

Rep. app. 383) and that it will "take effect upon the ratification of the Colorado River compact by Arizona, California, and Nevada" (clause (7), Rep. app. 383). No upper state can consume water which has already reached Lake Mead.

Article 7(b) (Rep. app. 401) of the Arizona contract provides for delivery of surplus waters only "to the extent such water is available for use in Arizona" under the Compact and the Project Act. Articles 7(e) and 7(f) (Rep. app. 401-02) expressly preserve the upper basin's rights to surplus waters by a "further equitable apportionment" pursuant to Articles III(f) and III(g) of the Colorado River Compact. In his report on the Central Arizona Project, the Secretary, pursuant to Arizona's contentions, recognized the upper basin's rights to share in surplus.[2]

3. *California Would Not Be Excluded From Use of More Than 4.4 Million Acre-Feet Per Annum Until Basin Uses Total 16 Million Acre-Feet Per Annum*

The Master asserts that if the section 4(a) limitation is read literally, California would be prohibited from consuming Colorado River water in excess of 4.4 million acre-feet per annum until the beneficial consumptive uses throughout the Colorado River basin totaled 16 million acre-feet per annum, a figure which the Master puts at about twice the present total basinwide

---

[2] *Ibid.* The report shows "total surplus to be allocated under the terms of art. III(f) of the Colorado River compact" to be 220,000 acre-feet per annum. Of this quantity, 55,000 acre-feet was earmarked for Arizona. Although the basis is not articulated in the report, it was evidently arrived at by dividing the surplus equally between the two basins (110,000 acre-feet to each); then, one half thereof (55,000 acre-feet) was "to be allocated to Arizona under Article III(f) of the compact."

consumptive use. (Rep. 172; see also Rep. 195-96.)

It is impossible to construe the Project Act, Limitation Act, or Compact to require California or any other state to allow water to go to waste if it is not used by others who have a prior or superior right thereto. Article III(e) of the Compact is explicit.[2a] The Master recognizes this principle in his proposed decree which permits a state to use water which will not be used in another state to which it is apportioned.[3] Thus, the Master himself refutes the faulty premise of this argument, that California may not use water which is apportioned for use elsewhere, but which is not now being used.

The problems which the Master poses need not exist. By a sensible reading, the "excess or surplus waters unapportioned by said compact" referenced in the limitation means all consumptive use from system water in the lower basin over and above 7.5 million acre-feet per annum of consumptive use.

C. Congress Did Not Exclude the Gila River System Waters From the Tri-State Compact Proposed in Section 4(a)

The Master asserts that clause (3) of the second paragraph of section 4(a) gives Arizona 2.8 million acre-feet from the main stream "in addition" to the ex-

---

[2a]Article III(e) provides:

"The States of the Upper Division shall not withhold water, and the States of the Lower Division shall not require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses." Rep. app. 373-74.

[3]Decree II(B)(8) (Rep. 349-50); see Rep. 314 n.4.

clusive use of the Gila River within her boundaries (Rep. 179). The Master also asserts that the first paragraph of section 4(a) must be read correlatively with the second, so that the Gila could not have been included in the first paragraph. The conclusion is that the first paragraph cannot be read literally to incorporate the Compact's systemwide concept which would include the Gila.

The Master's premise is wrong.

Clause (1) of the tri-state compact stated in the second paragraph of section 4(a) does not state that Arizona's 2.8 million acre-feet comes from the main stream. Clause (3) does not say that Arizona is entitled to the exclusive use of the Gila "in addition" to her 2.8 million acre-foot apportionment. The words "in addition" nowhere appear in the second paragraph. The Master has converted the "and" introducing clause (3) into the words "in addition." There are seven numbered clauses in the second paragraph, each after the first being introduced by the word "and". If each introductory "and" in that paragraph were read as "in addition" or "plus," much of the language of the paragraph would not make sense.

Even if the word "and" could be read as "in addition," the naming of the Gila River system is not the equivalent of naming all of the lower basin tributary systems. The Master would have us read "Gila River" as another instance of congressional shorthand, this time a code meaning "Gila River, Bill Williams River, Virgin River, Muddy River, Little Colorado River,

Kanab Creek, Johnson Creek, etc."[4] This construction not only violates the *expressio unius* maxim; it imputes absurd draftsmanship to Congress. Other provisions of the act make it clear that at the times when Congress wanted to designate tributaries, it knew how to draft language appropriate to reach that result.[5]

Clause (6) of the proposed tri-state compact provides (Rep. app. 383):

> "[A]ll of the provisions of said tri-state compact shall be subject in all particulars to the provisions of the Colorado River compact . . . ."

The Article III(a) apportionment in the Compact extends to the Gila (Rep. 141-42), and inconsistencies, if any, in clauses (1) and (3) must give way.

In 1939 the Arizona Legislature passed an act to ratify a tri-state compact containing the provisions of the authorized tri-state compact recited in section 4(a) of the Project Act. However, it recited that *"in addition* to the water covered by paragraphs (b) and (c)

---

[4]See Calif. Ex. 7307 (Tr. 22,162) which gives, tabulated from Arizona evidence, "Average Annual Virgin Flow of Lower Colorado River Basin Tributaries for the Period 1914 to 1945 as Such Tributaries Enter the Main Stream." The Gila averaged 1,403,600 acre-feet per annum, and all other lower basin tributary inflow averaged 1,493,900 acre-feet per annum, a total of 2,897,500 acre-feet per annum.

[5]The Project Act refers to "tributaries" in §§ 4(a) (second paragraph), 6, 13(b), 13(c) [three times], 13(d), and 15. In § 6 it directs the Federal Power Commission not to issue or approve permits or licenses "affecting the Colorado River or any of its tributaries, except the Gila," giving the clearest indication that when it wanted to designate all tributaries, it said so, and when it wanted to designate the Gila alone, it also said so.

The Master states that "certain sections of the Project Act apply to the Colorado River System" not just to the "mainstream." But he purports to explain that "in those sections Congress was dealing with problems which had system-wide application." (Rep. 173 n.32.) This "explanation" restates his conclusion that the problem dealt with in 4(a) does not have systemwide application.

hereof," Arizona should have exclusive use of the Gila within its boundaries.[6] (Emphasis added.) It also provided, very significantly, that it should be approved thereafter by Congress as well as by the states of California and Nevada.[7] The subsequent consent of Congress would not have been required if this were the same tri-state agreement to which Congress had already consented in advance in the second paragraph of section 4(a). Arizona must have recognized that adding "in addition" changed the meaning, as we now contend, and therefore required the subsequent consent of Congress. In 1941 a bill in the Arizona Legislature to ratify the proposed Project Act tri-state compact without amendment passed the Senate but failed in the House.[8] The 1941 bill by contrast did not require further consent by Congress, which had already consented to *this* tri-state compact in the second paragraph of section 4(a) of the Project Act.

The Master answers that if clause (3) merely assures to Arizona exclusive use of Gila waters within that state, clause (3) is redundant and useless because this result would follow even without clause (3). (Rep. 179 n.38.)[9] This is completely wrong for at least three reasons:

(1) The Master is wrong about the physical facts. He says (*ibid.*):

"California had no diversion works as of 1928

---

[6]Calif. Ex. 1322 for iden. (Tr. 11,436) § 1, art. III(d), p. 5.
[7]*Id.* § 3, p. 7.
[8]Calif. Ex. 1323 for iden. (Tr. 11,436).
[9]The Master also asserts that the legislative history supports his interpretation that the Gila was allocated to Arizona in addition to the 2.8 million plus half of surplus. We discuss the legislative history *infra* pp. 110-24, particularly 120-21, 123-24.

capable of diverting Gila River water for use in that state nor were there any contemplated at that time. Indeed, California has not used Gila River water since 1928 . . . ."

It can be conclusively and irrefutably demonstrated from the Master's Report and the record that Imperial Irrigation District's headworks remained below the mouth of the Gila River from a date before 1907 to 1941 and were capable of diverting, and necessarily diverted, Gila River inflow for use in California. It was not until 1942, when the All-American Canal went into full operation, that all of Imperial's diversions were made at Imperial Dam above the mouth of the Gila.[1] Congress also had been fully informed during the Project Act hearings and debates that California had works capable of diverting the Gila River inflow.[2] As of 1928,

---

[1]Compare the Master's accurate statement at 54-55 of the Report: "Water deliveries from the Colorado River to the Imperial Valley were first made at the turn of the century and, over the years, several diversion points in both the United States and Mexico were employed. In 1907 water was first diverted at Hanlon Heading into the Alamo Canal, which lay partly in Mexico and entered the United States near Mexicali. In 1918 a new diversion point, Rockwood Gate, went into operation upstream from Hanlon Heading and remained the primary diversion point until the All-American Canal was constructed. Construction of the canal was commenced in 1934. However, because of difficulties in the operation of Imperial Dam, which was dedicated in 1938 and which is the diversion point for the canal, service through the All-American Canal was delayed until 1940 and full service did not occur until February 1942. After this date no further deliveries were made through the Mexican works."

The mouth of the Gila is above both of Imperial's diversion points mentioned, Hanlon Heading (Calif. Ex. 121 (Tr. 7,004)) and Rockwood Gate (Calif. Ex. 120 (Tr. 6,991)).

[2]*E.g., Hearings on H.R. 6251 and H.R. 9826 Before the House Committee on Irrigation and Reclamation*, 69th Cong., 1st Sess. 209-10 (1926) (Delph E. Carpenter); 70 CONG. REC. 335 (1928) (Sen. Phipps).

the Gila made substantial contributions to the main stream.[3]

(2) Even if the Master's facts were correct and history were rewritten, his conclusion does not follow that clause (3) as we construe it would be redundant. However construed, the allocations in clauses (1) and (2) would not assure the Gila uses to Arizona, as did clause (3).

(3) Finally, such language, even if redundant, would not be useless. Arizona's Senator Hayden, author of the language,[4] wanted to doubly assure his constituents of protection for the Gila since the Gila's inclusion in the Compact's systemwide allocation was the rock on which Arizona's Compact ratification had foundered,[5] as Senator Hayden explained to the Senate in debate with Senator Johnson.[6]

In denying our claim that Arizona's main stream rights are affected by the extent of her Gila uses, the Master relies upon the assertion that California now has no appropriative rights to Gila waters.[7] The Master misses the point. California has the same interest in the Gila as the upper basin has in lower basin tributaries although the upper basin cannot use or affect the lower

---

[3]See Rep. 122. During the period 1903-1920, it contributed to the main stream a flow averaging in excess of 1,000,000 acre-feet annually. Ariz. Ex. 45 (Tr. 254), at 219, quoted in Calif. Exhibits, vol. 24.

[4]See Calif. Ex. 2014 (Tr. 11,173).

[5]See, *e.g.*, 70 CONG. REC. 335-36 (1928).

[6]70 CONG. REC. 467 (1928).

[7]Rep. 229-30.

basin tributary supply. (See Rep. 142-43.)[8] Tributary uses must be taken into account in determining the magnitude of surplus, hence the interbasin impact of the Mexican burden under Article III(c).[9] The Compact allocates benefits; hence, it is reasonable to include in the Compact interbasin accounting benefits from the lower basin tributaries. Similarly, it is reasonable to include in the limitation accounting Arizona's benefits from the Gila.

It is a well-established principle of water law that an upstream appropriator on the main stream can enjoin a junior appropriator from taking water from a downstream tributary, if that water is necessary to supply a main stream right further downstream which is

---

[8]Senator Ashurst argued with Wyoming's Governor Emerson, a Colorado River Compact negotiator, that the Gila is of no interest to the upper basin. Governor Emerson told him: "I am not able to see your argument in regard to the Gila River—I think it is as much a part of the Colorado River system as our [Wyoming's] Green River." *Hearings Pursuant to S. Res. 320 Before the Senate Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. 765 (1925).

[9]The Gila is above Mexico which is senior to all other rights on the river under the Mexican Water Treaty. (59 Stat. 1219 (1945); Ariz. Ex. 4 (Tr. 220).) The Mexican Treaty may be satisfied "from any and all sources" in the Colorado River system (Ariz. Ex. 4 (Tr. 220), art. 10), which obviously include the Gila. This does not mean that waters must be released from reservoirs on the Gila to flow to Mexico. In calculating the magnitude of Arizona's contribution to the Mexican burden the benefit she derives from the entire Colorado River system, including the tributaries, should be taken into account, but her contribution, thus calculated, should in fact be made from her share of the main stream, simply as a commonsense water conservation measure. Clause (4) of the tri-state compact set forth in the second paragraph of § 4(a), proposed by Arizona's Senator Hayden (Calif. Ex. 2014 (Tr. 11,173)), recognizes this principle. Clause (4) provides that Arizona would bear *one half* of the treaty burden, all from her share of the main stream, if the Gila should be released from that burden. The Master reduces this to 37⅓% (28/75). See *infra* pp. 223-25.

senior to both upstream rights.[10] Mexico, downstream from all United States uses, has the senior right by treaty to the waters of the Colorado River system. See Decree art. II(A) (Rep. 347).

II. THE LANGUAGE OF THE PROJECT ACT REQUIRES THE LIMITATION TO BE GIVEN ITS NATURAL AND LITERAL MEANING TO INCORPORATE THE COLORADO RIVER COMPACT

A. It Is Unreasonable To Reject the Project Act's Express and Specific Incorporation of the Colorado River Compact

A statute must be construed to produce a harmonious whole, to avoid conflicts between various provisions of the statute, and to give effect, if possible, to all provisions of the act.[1]

> "There is need to keep in view also the structure of the statute, and the relation, physical and logical, between its several parts."[2]

The Master asserts that Congress intended section 4(a) to relate solely to "mainstream" waters, that is, Lake Mead and the main Colorado River below Lake Mead within the United States, because these are the waters controlled by Hoover Dam (Rep. 173-74). Out of the entire statutory language the Master has found only two words in section 4(a) to seize upon in support of this thesis: The limitation on California is on our "aggregate annual consumptive use . . . of

---

[10]LONG, IRRIGATION § 135 (2d ed. 1916); KINNEY, IRRIGATION § 649, at 1,139 (2d ed. 1912).

[1]*E.g.*, 2 SUTHERLAND, STATUTORY CONSTRUCTION 336-39, 342-43 (3d ed. Horack 1943).

[2]Cardozo, J., in Duparquet Huot & Moneuse Co. v. Evans, 297 U.S. 216, 218 (1936).

water of and from the *Colorado River*."[2a] Those two emphasized words do not, as the Master asserts, point in the direction of relating the limitation solely to waters in Lake Mead and below. (See Rep. 174.) Those two words in section 4(a) do not refer to a segment of the Colorado River any more than do those same two words in section 19.[3]

When Congress intended to refer to "water stored" in Lake Mead, Congress said so expressly (sections 1, 5, and 8). If Congress had intended to restrict the limitation in section 4(a) to the waters controlled by Hoover Dam, Congress would also have said so expressly. In section 4(a), Congress did *not* say so expressly; on the contrary, it expressly incorporated the systemwide operation of the Compact.

The two phrases in the first paragraph of section 4(a)—[1] "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact" and [2] "excess or surplus waters unapportioned by said compact"—naturally and literally refer to the Colorado River Compact. The "natural reading"[4] of the entire Project Act compels the conclusion

---

[2a]California must physically take its share of Colorado River system water from the main Colorado River (which of course is fed by tributaries) because we have no access to any lower basin tributary systems.

[3]Section 19 (Rep. app. 395) authorizes supplemental compacts among the seven named Colorado River basin states for comprehensive development of "the Colorado River." Wyoming and New Mexico are included although the Colorado River main stream does not flow anywhere near these states.

[4]The Master rejects our contention that if Arizona effectively ratified the Compact in 1944 the limitation is no longer binding on California because "the *natural reading* of the language of the statute does not support [California's] contention." (Rep. 166; emphasis added.) We believe that we should have the benefits, if we are to have the detriments, of a natural reading of the statute.

that Congress meant what it said each of the 27 times it referred to the Colorado River Compact in the Project Act.[5] The Master's construction—23 of Congress' 27 references to the Compact mean Compact, but four do not[6]—must be rejected because there is no rational basis for any such distinction. As we have already pointed out (*supra* pp. 80-100), there is no reason why the limitation's reference to the Compact cannot be given its natural and literal meaning.

The Master's construction would create serious inconsistencies within the provisions of the Project Act itself. No one challenges that the numerous other references to the Compact in the Project Act—in the title and in sections 1, 4(a) (other than the four exceptions created by the Master), 6, 8, 12, 13, 18, and 19—refer to the Colorado River Compact. For example, section 4(a), first paragraph, and section 13(a), which refer to Article XI of the Compact (requiring its seven-state ratification), mean Article XI of the Compact. Section 4(a), second paragraph (clause (4)), which refers to Article III(c) of the Compact, means Article III(c) of the Compact. Section 6, which refers to Article VIII of the Compact, means Article VIII of the Compact. By excising the express and precise reference to the Compact in two phrases in the limitation, the Report has achieved the anomalous distinction of creating inconsistency by avoiding the natural and literal meaning

---

[5]Title and §§ 1, 4(a) (both paragraphs), 6, 8, 12, 13, 18, and 19 (Rep. app. 379-95).

[6]The two Limitation Act phrases which the Master concludes do not refer to the Compact are substantially repeated in the second paragraph of § 4(a), clauses (1) and (2), respectively. These are the four places in the Project Act out of the 27 references to the Compact (14 times in § 4(a)) that Congress, according to the Master, said "compact" but did not mean Compact.

of the statute. The section 4(a) express reference to Article III(a) of the Compact must mean Article III(a) of the Compact just as surely as the express reference in section 13(a) gave congressional consent to the Colorado River Compact and not to some other document, and waived the provisions of Article XI and not of some other article.

In dealing with broad conceptual matters, Congress may have some difficulty in choosing the words to describe its intention.[7] But Congress encountered no such difficulty in referring to the "Colorado River compact," to "said compact," and to "paragraph (a) of Article III." Such a precisely measured term, like Article III(d) of the Compact, "presents no questions of interpretation" (Rep. 144).

Why did Congress in section 4(a) use the words "paragraph (a) of Article III of the Colorado River compact" and the words "said compact" if Congress did not intend to refer to the Compact? The Master neither asks that question nor gives an answer. His figure "7,500,000 acre-feet" cannot be discovered from the first paragraph of section 4(a) unless reference is made to Article III(a) of the Compact.

The Master cannot escape the plain import of Congress' chosen words. The Master has not and cannot establish that Congress used the words "Colorado River compact" and "said compact" as a private code with a special usage only in section 4(a) of the Project Act, once in the first paragraph and once in the second. Because the Master's construction does violence to the

[7]See Freund, *The Use of Indefinite Terms in Statutes*, 30 Yale L.J. 437-38 (1921), pointing out that Congress, by its choice of words, can control, to some extent, the precision or certainty intended in a statute.

words chosen by Congress, the Master's construction must be rejected.

If the Master is right that the limitation's express reference to the Compact does not mean the Compact, Congress did not merely use what the Master calls "inappropriate" language (Rep. 173); Congress was guilty of woefully bad and misleading draftsmanship. Congress wholly failed to understand express and unmistakable language of the Compact—that the lower basin apportionment is from the Colorado River system, expressly defined as the Colorado River and its tributaries —explained and reexplained through successive Congresses.

Even if it were clear that Congress erred so egregiously, the Master's conclusion does not follow. Congress provided for the possibility that it might have misread the Compact. Congress did so in section 8(a) of the Project Act:

> "The United States, its permittees, licensees, and contractees, and all users and appropriators of water stored, diverted, carried, and/or distributed by the reservoir, canals, and other works herein authorized, shall observe and be subject to and controlled by said Colorado River compact in the construction, management, and operation of said reservoir, canals, and other works and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other purposes, *anything in this Act to the contrary notwithstanding, and all permits, licenses, and contracts shall so provide.*" (Emphasis added.)

What is "in this Act to the contrary notwithstand-

ing"? The closest scrutiny discloses nothing. But the possibility of something "to the contrary" was nevertheless provided for, and throughout the act are riveted provisions whose only purpose is to say: Should inconsistency between this act and the Compact be discovered, the Compact controls. The Limitation Act section concludes: "such uses always to be subject to the terms of said compact." The tri-state compact authorization concluded: "and (6) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact, and (7) said agreement to take effect upon the ratification of the Colorado River compact by Arizona, California, and Nevada."

The English language does not contain words clearer than those which Congress used, again and again, to say that the Compact is to control in the event of inconsistency.

In *Arizona v. California,* 292 U.S. 341 (1934), this Court, through Mr. Justice Brandeis, announced that the limitation on California means what it says (292 U.S. at 357):

> "Nor does Arizona show that Article III(b) of the Compact is relevant to an interpretation of § 4(a) of the Boulder Canyon Project Act upon which she bases her claim of right. It may be true that the Boulder Canyon Project Act leaves in doubt the apportionment among the states of the lower basin of the waters to which the lower basin is entitled under Article III(b). But the Act does not purport to apportion among the states of the lower basin the waters to which the lower basin is entitled under the Compact. *The*

Act merely places limits on California's use of waters under Article III(a) and of surplus waters; and it is 'such' uses which are [quoting from section 4(a)] *'subject to the terms of said compact.'"* (Emphasis added.)

In short, the Limitation Act does incorporate the Compact by reference.[8]

B. Article III(b) Waters Are Included in the "Excess or Surplus" Available to California if the Project Act Is "Read Literally"

The Master says that if the phrase "excess or surplus waters unapportioned by said compact" is "read literally," California has no share in the uses specified in Article III(b) of the Compact (Rep. 168-69). He rejects this result (Rep. 194). Then, relying on the Senate debates (Rep. 194-200), he construes this phrase to mean "all consumptive use above the first 7.5 million acre-feet of mainstream water in the Lower Basin, in the United States, in one year." (Rep. 200.)

Although the Compact provisions referenced by this

---

[8]Our offer of proof included extracts from Arizona's brief in the *Perpetuation of Testimony* case which demonstrate conclusively that the future suit for which Arizona sought the testimony to be perpetuated was a suit on California's undertaking in the Limitation Act. Calif. Ex. 7504 for iden., Tr. 22,760. In presenting the offer, California counsel called attention of the Master to the emphasized sentence from the opinion quoted in text:

"I believe, your Honor, that this can be fairly characterized as an alternative holding, Mr. Justice Brandeis' opinion, and if that is so, your Honor's Draft Report is asking the court sub silentio to overrule a prior decision of the Court."

The Master's response: "It may very well be." (Tr. 22,789.)

phrase are not precisely identified[9] (*supra* pp. 72-73), a literal reading of the limitation's reference to the Compact does not preclude California from the Article II(b) waters. The Compact, Project Act, and California Limi-

---

[9]The Report, however, states or implies at least three contradictory "literal" meanings of phrase [2], under one of which California would share in III(b) waters:

(1) Article III(a), (b), and (c) waters are apportioned by the Compact; therefore, phrase [2] refers to all system waters in excess of those apportioned waters. See Rep. 194: "Thus by a *literal Compact reading,* the phrase ['excess or surplus waters unapportioned by said compact'] would mean System water in excess of the aggregate of the apportionments of Article III(a), (b) and (c)." (Emphasis and bracketed words added.) This literal meaning is derived from Article III(f) which refers to "waters of the Colorado River System unapportioned by paragraphs (a), (b) and (c)" of Article III. *Cf.* Rep. 194.

(2) Article III(a) and (b) waters are apportioned by the Compact; therefore, phrase [2] refers to all system waters in excess of those apportioned waters. See Rep. 168: "Thus *read literally,* the phrase limiting California to one-half of any 'excess or surplus waters unapportioned by said compact' means that California may consume half of any water above that referred to in Article III(a) and (b)." (Emphasis added.) This "literal" reading is derived from Article III(c) which refers to the "waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b)" of Article III. *Cf.* Rep. 194.

(3) Article III(a) waters are apportioned by the Compact; therefore, phrase [2] refers to all lower basin system waters in excess of those apportioned waters. This definition results by necessary implication from the Master's statements at Rep. 170-71. The Master asserts that if the two paragraphs of § 4(a) are read together, Congress consented in advance to a tri-state compact which provided that out of the first 7.5 million acre-feet of consumptive use, 4.4 million is allocated to California, 2.8 million is allocated to Arizona, and 300,000 is allocated to Nevada; and any excess is divided half to California and half to Arizona. The Master then concludes (Rep. 171): "Thus, a *literal reading* of Section 4(a) would authorize Arizona, California and Nevada to enter into a compact for the division among themselves of *all* of the *Lower Basin system water,* including the water being used by New Mexico and Utah." (Emphasis added.) This conclusion cannot follow unless "excess or surplus" waters include all lower basin water above III(a) waters, including III(b) waters.

tation Act all treat Article III(b) waters as "excess . . . waters unapportioned" by the Compact, in which California may share.

The Master is unable to explain "whatever may account for [the] segregation [of Article III(b)] as a separate provision of the Compact" (Rep. 147). Arizona explained very well in her brief in *Arizona v. California,* 283 U.S. 423 (1931), the reason why Article III(b) uses a deliberate circumlocution to avoid the word "apportioned," and why Article III(b) appears at all, instead of a quantity of 8,500,000 acre-feet in Article III(a) for the lower basin:[1]

> "The difference in language between paragraphs (a) and (b) is plain, and the difference in meaning is clear. Paragraph (b) does not *apportion in perpetuity,* as does paragraph (a), any beneficial use of water. It is very careful not to do this. It is to be read with paragraph (c) and relates solely to the method of sharing between the basins any future Mexican burden which this Government might recognize. This burden is to be satisfied first out of 'surplus' waters, and surplus waters are defined, not as surplus over quantities 'apportioned,' but as surplus over quantities '*specified* in paragraphs (a) and (b).' Any deficiency remaining is to be borne equally by the two basins. Thus the Lower Basin, which without paragraph (b) might use water in excess of its apportionment without acquiring any exclusive right in perpetuity thereto, is enabled to retain such uses to the extent of 1,000,000 acre-feet per annum against the first incidence of the Mexican burden. There-

[1]Calif. Ex. 2043 (Tr. 12,379), pp. 2-3.

after it is entitled to require the Upper Basin to share from its apportionment equally in the satisfaction of any deficiency. In other words, all that paragraphs (b) and (c) accomplish is to require the Upper Basin to reduce its apportionment in favor of Mexico before the Lower Basin is required to do so, the Lower Basin being entitled to contribute first, to the extent of 1,000,000 acre-feet, water which it may have used but to which it has no exclusive right in perpetuity—that is, water not apportioned to it. The water apportioned is that to which exclusive beneficial use in perpetuity is given in paragraph (a), less any deductions which may have to be recognized as provided in paragraphs (b) and (c)."[2]

This accords with the report of Delph Carpenter, Colorado River Commissioner of the State of Colorado,[3] which was printed in the *Congressional Record*[4] during the debates on the Project Act:[5]

"The repayment of the cost of the construction of necessary flood-control reservoirs for the protection of the lower river country, probably will result in a forced development in the lower basin. For this reason a permissible additional development in the lower basin to the extent of a beneficial consumptive use of one million acre-feet, was recognized in order that any further apportionment of surplus waters might be altogether avoided or at least delayed to a very remote period. *This right*

[2]Arizona's counsel were Clifton Mathews, now a Senior Circuit Judge of the Ninth Circuit Court of Appeals, and Dean Acheson, subsequently Secretary of State.

of additional development is not a final apportionment. This clause does not interfere with the apportionment to the upper basin or with the right of the States of the upper basin to ask for further apportionment by a subsequent commission." (Emphasis added.)

III. THE LEGISLATIVE HISTORY OF THE PROJECT ACT SUPPORTS THE NATURAL AND LITERAL MEANING OF THE LIMITATION'S INCORPORATION OF THE COLORADO RIVER COMPACT

Not one word in the legislative history affirmatively supports the Master's thesis that Congress intended to relate the limitation solely to "mainstream" waters in Lake Mead and below.

Some members of Congress correctly understood that "III(a) waters" in the Compact include the main stream and all tributaries; some apparently thought, at times, that only the Gila was excluded; some apparently thought, at times, that the "III(a) waters" were identified with the flow at Lee Ferry. But not one Senator or Representative departed from the Compact or identified the limitation, as the Master does, with the waters in Lake Mead and the main Colorado River below. No one in Congress, or anywhere else for over 30 years after, until the Master proposed this "novelty,"[6] ever so suggested.

The Master's segregation of the Colorado River at Lake Mead into two rivers is based solely on an inference spelled out in his Report: Hoover Dam controls

---

[6]Tr. 22,762.

only "mainstream" water; it cannot control the "tributary" water, including the main stream between Lee Ferry and Lake Mead.[6a] Therefore, by inference, section 4(a) of the Project Act applies only to the "mainstream." (Rep. 173-74.) This inference cannot stand in the face of the limitation's express reference to the Compact, which applies to all Colorado River system waters in the lower basin. Moreover, this inference erroneously attributes legal significance to the location of Hoover Dam and Lake Mead. The objective of Congress at all times has been a comprehensive basin-wide plan of river development[7] which has gone forward since the completion of Hoover Dam in 1935.[8] Black

---

[6a]The Master's hydrology and water law are wrong. Hoover Dam can affect uses from the main stream and tributaries above Lake Mead, by making natural flow previously appropriated below Lake Mead available for appropriation above Lake Mead to the extent that downstream appropriators are satisfied from flood flows conserved by the reservoir. Glen Canyon Dam, below all points of upper basin use, serves a similar purpose for upper basin users who are enabled to meet the Compact's delivery obligations from stored water in Glen Canyon reservoir, thus making additional natural flow above the reservoir available for use in the upper basin.

[7]This purpose is manifested in Project Act title and §§ 15, 16, and 19 (Rep. app. 379, 394-95). See S. REP. No. 592, 70th Cong., 1st Sess., pt. 1, at 27 (1928), which is Calif. Ex. 203 (Tr. 7,715).

[8]Davis Dam, located 67 miles below Hoover Dam, was completed about 1950; it "implements regulation of releases at Hoover Dam into the seasonal pattern required by downstream irrigation and domestic users." (Rep. 33.) Parker Dam, 88 miles farther downstream, was completed about 1938; it "regulates the flow of the Bill Williams in excess of local uses in Arizona." (Rep. 33-34.) The Colorado River Storage Project Act of 1956 (70 Stat. 105, 43 U.S.C. §§ 620-620*o* (1958)), authorizes construction of four storage reservoirs in the upper basin including Glen Canyon Dam, which is almost equivalent to another Hoover Dam. Closure of Glen Canyon Dam is scheduled for 1962 (Tr. 21,351-52), and two other upper basin storage reservoirs (Navajo Dam and Flaming Gorge Dam) are under construction.

Canyon, Boulder Canyon, Bridge Canyon, and Glen Canyon were all proposed in Congress as possible sites for the first high dam, which would be authorized by the Project Act.[9] Congress authorized the Secretary to choose between Boulder Canyon and Black Canyon,[1] some 20 miles apart, as the location of Hoover Dam, narrowing the choice to these two sites, not for legal reasons, but for engineering and economic reasons. The dam had to be located at a place where it would provide adequate river regulation and flood and silt control. Yet the dam would have to be located close enough to major markets in southern California for power production to repay the cost of the dam.[2] Furthermore, projects to divert from the river between Lee Ferry and Lake Mead for use in both Arizona and California were under active consideration before and after 1928.[3] Hoover Dam's location could have no legal significance in connection with the limitation on California.

A. The Limitation's Incorporation of the Compact Is Purposeful and Rational

The Project Act manifests Congress' purpose to subjugate all system waters to the Compact and to protect

---

[9]*E.g.*, J. G. Scrugham (Governor of Nevada, previously Nevada's Compact Commissioner, subsequently Senator from Nevada), as special adviser to the Secretary of the Interior, "Report on the Development of the Colorado River Basin" (Dec. 16, 1927), *Hearings on H.R. 5773 Before the House Committee on Irrigation and Reclamation,* 70th Cong., 1st Sess. 469, 514, 517-20 (1928); Senator Pittman, 68 CONG. REC. 4406-10, 4412, 4414 (1927); Senator Johnson, 67 CONG. REC. 12625 (1926).

[1]Project Act § 1 (Rep. app. 379).

[2]S. REP. No. 592, 70th Cong., 1st Sess., pt. 1, at 9-10 (1928) (Calif. Ex. 203 (Tr. 7,715)); H.R. REP. No. 918, 70th Cong., 1st Sess., pt. 1, at 6-8 (1928); F. E. Weymouth, *Hearings Pursuant to S. Res. 320 Before the Senate Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. 474, 480-81 (1925), quoted at 68 CONG. REC. 4309, 4311 (1927), by Senator Oddie of Nevada.

[3]See *infra* pp. 124-27.

the upper basin apportionment thereunder.[4] The reasons were identical with those which the Master finds to support the "language of the Compact that subjugates both mainstream and tributaries to its rule." (Rep. 143.)

To achieve this purpose, the limitation on California was employed by Congress in the Project Act to help make a six-state compact acceptable to the upper basin if Arizona would not ratify. The Master correctly identifies the reason (Rep. 165):

> "Absent seven-state ratification of the Compact, the Upper Basin required protection against appropriations in the Lower Basin in excess of the Compact apportionment. The Upper Basin feared that Arizona might not ratify, in which event California, unless limited, would be able to appropriate from the mainstream substantially all of the Lower Basin apportionment, leaving Arizona free to make further appropriations from the mainstream outside the Compact ceilings. The limitation on California left a sufficient margin for exploitation by Arizona so as to secure the Upper Basin against

[4]For example, see the following provisions of the Project Act (Rep. app. No. 3): The title states a basic purpose of the act to be "the approval of the Colorado River compact." Section 1 authorizes construction of works "subject to the terms of the Colorado River compact." Section 6 specifies, as part of the second priority, that Hoover Dam and Lake Mead be operated for "satisfaction of present perfected rights in pursuance of Article VIII of said Colorado River compact." Sections 8(a) and 13(b) and (c) subject the United States and all water users to the Compact. Section 13(a) gives the constitutionally required consent of Congress to the Compact. Section 19 consents to negotiation of compacts "supplemental to and in conformity with the Colorado River compact."

See S. Rep. No. 592, 70th Cong., 1st Sess., pt. 1, at 14-16 (1928) (Calif. Ex. 203 (Tr. 7,715)); H.R. Rep. No. 918, 70th Cong., 1st Sess., pt. 1, at 13-15 (1928).

undue encroachment by the nonratifying state."

Using Compact terminology to solve this Compact problem is the most reasonable construction to give to the limitation. By this construction Congress could simply, quickly, and accurately determine that the limitation accompanying a six-state agreement would afford to the upper basin substantially the protection of a seven-state agreement.

Congress clearly intended the limitation to incorporate the Compact, whatever it may mean. This was the overriding intent of Congress regardless of any individual Senator's understanding or misunderstanding of the meaning of the Compact.[5] Congress must have understood the systemwide scope of the Compact.[6] Furthermore, from 1923 through 1928, the text of the Com-

---

[5]For the standard of interpretation contemplated by Congress, see the discussion between Senator Bratton and Senator Pittman. (70 CONG. REC. 469-70 (1928), quoted *infra* pp. 122-23.)

[6]Section 13(a) of the Project Act, which gives the constitutionally required congressional consent to the Compact, must be read as though the language of the Compact is set forth therein *in haec verba.* The Constitution (art. I, § 10, cl. 3) requires congressional consent to an interstate compact so that Congress may protect the national interest by refusing to consent to a compact which is not in the best interests of the Nation. See Florida v. Georgia, 58 U.S. (17 How.) 478, 494 (1855); Frankfurter & Landis, *The Compact Clause of the Constitution—A Study in Interstate Adjustments,* 34 YALE L.J. 685, 694-95 (1925); ZIMMERMANN & WENDELL, THE INTERSTATE COMPACT SINCE 1925, at 57 (1951); THURSBY, INTERSTATE COOPERATION 67-69 (1953). In order to do so, Congress must be presumed to know the terms of the Compact and to understand them.

pact was reported to Congress numerous times,[7] and its "unmistakable language" (Rep. 143) clearly reveals its systemwide application—to main stream and tributaries in the lower basin. (Rep. 142-44.) On numerous occasions during that period, the systemwide application of the Compact was authoritatively reported or explained to Congress.[8] Thus, there is no possibility that Congress did not mean Compact when it said Compact. There is no reason to reject the natural and literal meaning of Congress' words.

It is neither necessary nor sensible to read the limitation, particularly in view of its purpose, by ignoring its express reference to the Compact and by applying that limitation solely to the "mainstream," Lake Mead and below, a body of water which is completely foreign to any classification defined in or dealt with by the Com-

Ashurst of Arizona, *Hearings on S. 727 Before the Senate Committee on Irrigation and Reclamation,* 68th Cong., 2d Sess. 313-15 (1925); Delph E. Carpenter, *Hearings Pursuant to S. Res. 320 Before the Senate Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. 315-18 (1925); H.R. REP. No. 1657, 69th Cong., 2d Sess., pt. 1, at 26-29 (1926); H.R. REP. No. 918, 70th Cong., 1st Sess., pt. 1, at 32-34 (1928); Sen. Bratton, New Mexico, 70 CONG. REC. 324-25 (1928); Carpenter report, quoted *id.* at 579-80.

[8]*E.g.,* Herbert Hoover, 64 CONG. REC. 2710-11 (1923) (answers to questions 4, 6, and 8 of questionnaire on Colorado River Compact (Ariz. Ex. 55 (Tr. 260)); Delph E. Carpenter, *Hearings on H.R. 6251 and H.R. 9826 Before the House Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. 208-10 (1926); Sen. Johnson, Calif., 70 CONG. REC. 466 (1928).

pact. The Master's construction[9] defeats the conceded purpose of the limitation to leave "a sufficient margin for exploitation by Arizona so as to secure the Upper Basin against undue encroachment by the nonratifying states" (Rep. 165). (See *supra* pp. 113-14.) Bridge Canyon, above Lake Mead, was an alternative diversion point considered for Metropolitan Water District's Colorado River Aqueduct; such plans were known to Congress. (*Infra* pp. 124-27.) Under the Master's construction of the limitation, a Metropolitan diversion at Bridge Canyon (above the "mainstream") would provide water to California in addition to the quantities specified in the limitation. This would increase California's rights to lower basin waters by the amount of the Bridge Canyon diversion and decrease in like amount the quantity available to a nonratifying Arizona from the main Colorado River in the lower basin. The upper basin congressmen could not have intended that their protection under the limitation should depend upon the choice of diversion points for California projects.

Furthermore, the Master's reading would be egregiously unfair to California. Under the Master's recommended decree, Arizona, Nevada, New Mexico, and Utah uses on all lower basin tributaries are ignored. But under the Colorado River Compact, which the Master properly construes to include lower basin tributaries (Rep. 142-44), tributary uses in these four lower basin states diminish the rights which the lower division states

---

[9]Rep. 173: "Thus I hold that Section 4(a) of the Project Act and the California Limitation Act refer only to the water stored in Lake Mead and flowing in the mainstream below Hoover Dam, *despite the fact* that Article III(a) of the Compact deals with the Colorado River *System*, which is defined in Article II(a) as including the entire mainstream and the tributaries." (First emphasis added.)

(Arizona, California, and Nevada) have under Article III(c) of the Compact to require states of the upper division (Colorado, Utah, New Mexico, and Wyoming) to supply water to satisfy the Mexican Treaty, because these uses on lower basin tributaries augment the quantities for which the lower basin is accountable in determining the obligation of the upper division states to deliver water in addition to that required by Article III(d).

In other words, in consequence of the Master's severing the Compact from the limitation, California loses the tributary issue twice: (1) In lower division (Arizona, California, and Nevada) versus upper division (Colorado, Wyoming, New Mexico, and Utah), tributaries are *included,* to California's disadvantage, by reducing the contribution to the Mexican burden which the lower basin may demand at Lee Ferry, thus increasing California's portion of the Mexican burden. (2) In *Arizona v. California,* tributary uses in Arizona and Nevada are *excluded,* again to California's disadvantage, in computing the quantity of the total claims of those two states which may be asserted against the "mainstream" in competition with California's share. It is unreasonable almost to the point of absurdity that any state would on the same day make two such bad and inconsistent bargains with respect to lower basin tributaries, one by enacting the Limitation Act, the other by ratifying the Compact. That is the result, however, of the "patentable novelty" which rewrites the words of one bargain—the Limitation Act.

If the Court decides not to construe the limitation consistently with the Compact, then it should construe the Compact consistently with the limitation.

B. Senator Phipps, Author of the Limitation and Chairman of the Reporting Committee, Made His Intention To Refer to the Compact Unmistakable

A principal reason given by the Master for reading the Colorado River Compact out of the limitation is that the importation of Compact concepts flies "in the face of every expression of intent made by any Senator who had anything to do with the legislation." (Rep. 180.) This assertion is completely wrong. The authoritative legislative history of the first paragraph of section 4(a) supports only the conclusion that the word "Compact" was inserted in phrases [1] and [2] of the limitation purposefully, intentionally, and deliberately.

Senator Phipps, chairman of the reporting committee, made this abundantly clear on the Senate floor when he perfected the language of the limitation which he had offered as an amendment to the act. At the time Senator Phipps offered his perfecting amendment, the limitation—phrase 1—referred simply to "the waters apportioned to the lower basin States by the Colorado River compact."[1] Senator Phipps made his intention unmistakable in offering his perfecting amendment:[2]

> "Referring to the amendment which is now before the Senate, *in order to remove any possible misunderstanding regarding the 4,400,000 acre-feet of water,* I desire to *perfect* the amendment by inserting on page 3, line 4,[3] after the word 'by' the words 'paragraph (a) of article 3 of,' so that it will show that that allocation of water refers directly to *the seven and one-half million*

[1]Calif. Ex. 2012 (Tr. 11,173), p. 3, lines 3-4.
[2]70 CONG. REC. 459 (1928), quoted in Calif. Ex. 2015 (Tr. 11,173), at 54.
[3](Footnote ours.) Calif. Ex. 2012 (Tr. 11,173), p. 3, line 4.

acre-feet of water that are mentioned in paragraph 3." (Emphasis added.)

Senator Phipps' perfecting amendment was accepted without objection.[4]

Before Senator Phipps perfected his amendment, misunderstanding concerning the precise provision of the Compact intended to be referenced might have been conceivable.[5] There can be no occasion whatever for misunderstanding after the amendment was perfected. It is incredible that Senator Phipps perfected his amendment to make precise reference to Article III(a) of the Compact if he did not intend to refer to the Compact at all. If the Master were right, Senator Phipps did not "perfect" his amendment, he hopelesly obscured its meaning by using a "shorthand" so esoteric that it defied translation for more than 30 years.[6]

It is inconceivable that Senator Phipps would have referred to the Compact "inappropriately." Senator Phipps was the chairman of the Senate Committee on Irrigation and Reclamation which held extensive hearings on the fourth Swing-Johnson bill[7] and reported

---

[4]*Supra* note 2.

[5]Before perfection, the words "waters apportioned to the lower basin States by the Colorado River compact" might have been misunderstood to refer to the 75 million acre-feet of flow which Article III(d) requires to pass Lee Ferry every 10 years. *Cf.* Rep. 187-88.

[6]The Master says that "[T]his inappropriate reference to the Compact has been the cause of seeming inconsistency in the Act and of much confusion in its interpretation." (Rep. 173.)

[7]*Hearings on S. 728 and S. 1274 Before the Senate Committee on Irrigation and Reclamation,* 70th Cong., 1st Sess. (1928). Senator Phipps had also been a member of that Senate committee during consideration of the second and third Swing-Johnson bills. See *Hearings on S. 727 Before the Senate Committee on Irrigation and Reclamation,* 68th Cong., 2d Sess. (1924); *Hearings Pursuant to S. Res. 320 Before the Senate Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. (1925).

the bill favorably containing the first version of a proposed limitation to be exacted from California.[8] He was the author of several amendments (actually substitute texts) to section 4(a),[9] one of which became the first paragraph of that section.[1] Senator Phipps must have been thoroughly familiar with the provisions of the Compact and thus understood that the waters apportioned by Article III(a) of the Compact embraced both the main stream and the tributaries in the lower basin. He surely intended to define the limitation on California in those terms. For example, two days before he perfected his amendment, he and Senator Hayden engaged in the following colloquy upon the limitation provision (70 CONG. REC. 335):

> "Mr. HAYDEN. If the Senator thought there was force in that argument, I should think that he would have included in his amendment a provision eliminating the waters of the Gila River and its tributaries, as my amendment does.
>
> "Mr. PHIPPS. I do not consider it necessary because the bill itself, not only the present substitute measure but every other bill on the subject, ties this question up with the Colorado River compact.
>
> "Mr. HAYDEN. My amendment does that.
>
> "Mr. PHIPPS. Yes; that is true, but under estimates of engineers—one I happen to recall being made, I think by Mr. La Rue—notwithstanding all of the purposes to which water of the Gila may be put by the State of Arizona, at least 1,000,000 acre-feet will return to the main stream. Yet Arizona contends that that water is not available

[8]See Calif. Ex. 2001 (Tr. 11,173), p. 7, lines 4-12.
[9]Calif. Exs. 2004, 2009, 2012 (Tr. 11,173).
[1]Calif. Ex. 2012 (Tr. 11,173).

to California; whereas to-day and for years past at least some of the waters from the Gila River have come into the canal which is now supplying the Imperial Valley.

"It is not a definite fixed fact that with the enactment of this proposed legislation the all-American canal is going to be built within the period of seven years; as a matter of fact, it may not be built at all; we do not know as to that. *But I do not think that the water from the Gila River, one of the main tributaries of the Colorado, should be eliminated from consideration. I think that California is entitled to have that counted in as being a part of the basic supply of water.*" (Emphasis added.)

To resolve any differences among conflicting expressions of intention by Senators, the specific statement by Senator Phipps, author of the first paragraph and of its perfecting amendment, and chairman of the reporting committee, must be taken as controlling.[2] If the Master is right, Senator Phipps did not understand his own amendment.

C. Confused, Conflicting, and Ambiguous Statements on the Floor of the Senate Cannot Overturn the Natural and Literal Incorporation of the Compact in the Limitation

If the Master is correct—that "Compact" does not mean Compact, and that "Colorado River" means "Lake Mead and below"—the English language is not adequate to achieve the evident purpose of the Project Act and the limitation on California. The fault in this

[2]Schwegmann Bros. v. Calvert Distillers Corp., 341 U.S. 384, 394-95, 399-400 (1951); United States v. Wrightwood Dairy Co., 315 U.S. 110 (1942).

construction lies not with Congress nor with the words which Congress put in the statute. It lies in ignoring the persuasive legislative history, *supra,* and in yielding the natural and literal meaning of express and purposeful words to confused debate originating during a filibuster.[3]

The Master relies heavily upon Senator Pittman of Nevada (Rep. 176-77). However, the Master himself has elsewhere made clear why Senator Pittman's statements cannot be accepted as the basis for interpreting the limitation (Rep. 188-90, 193): Senator Pittman, as did Senator Hayden (Rep. 190-93), confused the Article III(a) apportionment with the Article III(d) flow at Lee Ferry. The Master has conclusively demonstrated that these two articles cannot be identified (Rep. 144, 187-88). If "all subsequent discussion in the Senate flowed in the same channel" (Rep. 190), this conceded confusion is not a persuasive substitute for the clear and literal meaning of the statute or its authoritative legislative history.

Senator Pittman, in debate with Senator Bratton over the tri-state compact set forth in the second paragraph of section 4(a), expressed his standard for interpreting specific language in a statute in light of a conflicting legislative history (70 CONG. REC. 470):

> "When Congress uses certain language, there may be a vast difference of opinion among Senators as to what the courts will construe it to mean; but when they use exact language which the Congress of the United States says they may use in an agree-

---

[3]See Senator Hayden's description in 1949 of this filibuster in Ariz. Reply to Calif. Answer, app. 6, p. 95.

ment, then the Congress is supposed to know what the agreement means."

The Master also quotes Senator Johnson (Rep. 179 n.38) to the effect that under the tri-state compact set forth in section 4(a) Arizona would receive 2.8 million acre-feet "in addition to" the Gila. The worst that can be said is that Senator Johnson's statements during the debates in the press to secure passage in face of an Arizona filibuster (her second one) were not always consistent. He had earlier read to the Senate the definition of the Colorado River system from Article II(a) of the Compact, and Herbert Hoover's answer to question 4 propounded by Senator Hayden[4] which explained the reason for including all tributary systems in the Compact (70 CONG. REC. 466 (1928)). Senator Johnson then stated that he opposed the pending Hayden version of a tri-state compact amendment to section 4(a)[5] because it would amend the Compact by excluding the Gila *(ibid.)*. Senator Hayden denied this *(ibid.)* and explained that the purpose of his amendment was to assure Arizona the use of Gila River waters, free from any obligation to supply Mexico *(id.* at 467).

Senator Johnson accepted the tri-state compact provision as the second paragraph after it had been amended to make it permissive rather than mandatory so that it did not represent "the will or the demand or the request" of Congress (*id.* at 472). Thereupon, all efforts to clarify it ended.

Senator Hayden and Senator Ashurst voted against the bill (*id.* at 603); apparently, the Arizona Senators

---

[4]Ariz. Ex. 55 (Tr. 260), text in Calif. Exhibits, vol. 24, pp. A31, A33. Mr. Hoover was chairman of the Colorado River Commission which negotiated the Compact.

were not convinced that the Project Act was as favorable to Arizona as the Master's Report would provide.

To summarize: The limitation, read naturally, makes an express reference to the Colorado River Compact. The weight of the legislative history accords with the literal meaning of the statute, and thus concludes any doubts as to the construction of the language.[6] Taken most strongly against us, however, the legislative history is ambiguous, conflicting, and uncertain, and therefore cannot be permitted to overturn the natural meaning of the language of the limitation.[7]

IV. TRUNCATION OF THE COLORADO RIVER AT LAKE MEAD IS NOT LOGICAL BECAUSE DIVERSIONS OF WATER FROM BRIDGE CANYON (ABOVE LAKE MEAD) HAVE BEEN PLANNED FOR USE IN BOTH ARIZONA AND CALIFORNIA BEFORE AND AFTER ENACTMENT OF THE PROJECT ACT

Prior to passage of the Project Act, Congress was told of plans to divert large quantities of Colorado River water at Bridge Canyon above Lake Mead for use in Arizona and in California.[1] Senator Cameron of Arizona advocated such a plan on the Senate floor during the debates on the third Swing-Johnson bill.[2] The Senator placed in the *Congressional Record* a map,

---

[6]Schwegmann Bros. v. Calvert Distillers Corp., 341 U.S. 384, 390 (1951); United States v. Spelar, 338 U.S. 217, 219 (1949). See Jones, *The Plain Meaning Rule and Extrinsic Aids in the Interpretation of Federal Statutes,* 25 WASH. U.L.Q. 2, 21, 25-26 (1939).

[1]*E.g.,* 68 CONG. REC. 4429-30, 4444-46 (Cameron), 4516 (Phipps), 4521 (Kendrick, Pittman) (1927).

[2]68 CONG. REC. 4429-30, 4444-46 (1927).

illustrating the diversion at Bridge Canyon for use in Arizona and California.[3]

Since the passage of the Project Act, diversion points for the proposed Central Arizona Project at Bridge Canyon or Marble Canyon (above Lake Mead) have been studied as well as the diversion point at Parker Dam (Rep. 227).

The Thirteenth Annual Report of the Arizona Interstate Stream Commission to the Governor of Arizona (1960) states (p. 31):

> "The circulation of the Special Master's draft report on *Arizona v. California et al.* has given new impetus to plans for utilizing Colorado River water in Arizona. An integral part of Colorado River water utilization plans for Central Arizona is a route for diversion. The Stream Commission and the [United States] Geological Survey have undertaken a co-operative program to map the unsurveyed area which would be traversed by a proposed diversion route from Marble Canyon. With the mapping program nearing completion, detailed cost estimates can be made which will facilitate consideration of the relative desirability of this diversion route to central Arizona."

Marble Canyon, just above Bridge Canyon and below Lee Ferry, is another site on the Colorado River main stream above Lake Mead which the Special Master defines as a "tributary" outside the terms of his decree.

After passage of the Project Act, The Metropolitan Water District of Southern California investigated a large number of alternative routes for its Colorado River Aqueduct, finally reducing them to four. The

---

[3]68 CONG. REC. 4431 (1927).

diversion points for these four routes were (1) Parker Dam, which was ultimately selected, (2) Boulder Canyon, (3) Bridge Canyon, above Lake Mead, and (4) the All-American Canal. The district's report on these four routes shows that the Bridge Canyon diversion was under serious consideration until late 1930.[4]

In the History and First Annual Report of the Metropolitan Water District, for the period ending June 30, 1938, Metropolitan reported that the most important point in consideration of a Bridge Canyon diversion was its cost of some $558,000,000. The decision was still not final (p. 84):

> "When the upper river shall have been completely developed and controlled and when the demand for power in the Southwest has been largely increased and the supply of cheap steam power has been exhausted, it may be desirable to construct a dam from 600 ft. to 900 ft. high at Bridge Canyon for the purpose of producing hydroelectric energy. When such a dam shall have been constructed and financed by some agency other than the Metropolitan Water District, it may be found feasible to make a gravity connection to it thus eliminating all

---

[4]See The Metropolitan Water District of Southern California, *Summary of Preliminary Surveys, Designs and Estimates for the Metropolitan Water District Aqueduct and Terminal Storage Projects* (November 1930) and *Final Report of the Engineering Board of Review* (December 1930), a copy of which is tendered to this Court and to each of the other parties with the filing of this brief. The map, plate 2 *infra,* shows aqueduct routes from figure 64, p. 148, of this document. Appendix V, p. 155, explains reasons for rejecting the diversion from Bridge Canyon.

or part of the pumping necessary to bring the water to Los Angeles over a pumping route."

The proposed diversions for projects in both Arizona and California described above are illustrated on plate 2 *infra*.

In light of these facts, the theory of truncation of the Colorado River at Lake Mead is not now, and never was, a viable idea. Why, for example, would Congress, with full knowledge of tremendous diversions proposed at Bridge Canyon above Lake Mead for use in Arizona and California, have restricted the operation of Project Act sections 4(a) and 5 solely to Lake Mead and below? Why did not California divert water at Bridge Canyon (or at least make a more substantial effort to do so) if the consumptive use of this water diverted above Lake Mead would not be charged under the limitation? Why would Arizona press for a Central Arizona Project to divert at Bridge Canyon where her late priority project would have to compete with senior California projects when the water supply became scarce? (See Rep. 247.) At Parker, on the other hand, the Central Arizona Project would share in Arizona's pro rata allocation of "mainstream" waters independent of interstate priorities under the Master's decision.

There is only one answer to these questions: Congress did not truncate the Colorado River at Lake Mead.

V. THE CONSENSUAL NATURE OF THE LIMITATION, ESTABLISHED BY THE PROJECT ACT AND THE RECIPROCAL CALIFORNIA LIMITATION ACT UPON SIX-STATE RATIFICATION OF THE COMPACT, REQUIRES A NATURAL AND LITERAL READING OF THE LIMITATION TO INCORPORATE THE COLORADO RIVER COMPACT

The Master construes the limitation as if it were imposed by congressional fiat.[1] This is wrong, as the Master sometimes recognizes.[2]

The consensual nature of the limitation

The limitation is cast in the classic language of contract: The United States made an offer to California (first paragraph of section 4(a)) to "agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah and Wyoming, as an express covenant and in consideration of the passage of this Act . . . ." California accepted that offer by enacting the limitation and by her six-state ratification of the Compact. Five other basin states accepted the limitation as the predicate for six-state ratification of the Compact. Colorado, Nevada, New Mexico, and Wyoming forbore to repeal between December 21, 1928 (when the Project Act was enacted), and June 25, 1929 (when the Project Act became effective), their earlier six-state ratifications of the Compact. Utah, which had repealed her six-state ratification in 1927, ratified the Compact again as a six-state agreement shortly after California

---

[1] *E.g.*, Rep. 165: "The reason that *Congress imposed this limitation* on California's consumptive use of mainstream water . . . is apparent from the statutory language itself." (Emphasis added.) See also Rep. 164, 165-66.

[2] See Rep. 182, 317.

enacted the Limitation Act. All six ratifying states expressly waived seven-state ratification required by Article XI of the Compact, as specified in sections 4(a) and 13(a) of the Project Act. Arizona did not ratify. The Compact, the Limitation Act, and the Project Act all became effective simultaneously upon presidential proclamation on June 25, 1929. (See Rep. 24-27.) This group of documents established a statutory compact between California and the United States for the benefit of the six other expressly named basin states.[3] An interstate agreement or compact has often been characterized by the Court as a contract[4] and as a treaty.[5]

Significance of consensual nature in problems of interpretation

The consensual nature of the limitation is important in construing the meaning of section 4(a) of the Project Act. No one has the option to accept or reject ordinary federal statutes. Section 4(a) of the Project Act is deliberately oriented in the opposite direction. The Project Act was an offer to the basin states to

---

[3]The United States and a state may validly enter into agreements by means of reciprocal legislation. Stearns v. Minnesota, 179 U.S. 223, 248 (1900); Searight v. Stokes, 44 U.S. (3 How.) 151 (1845); Neil, Moore & Co. v. Ohio, 44 U.S. (3 How.) 720 (1845).

Biddle, 21 U.S. (8 Wheat.) 1, 92 (1823); see concurring opinion of Jackson, J., West Virginia *ex rel* Dyer v. Sims, 341 U.S. 22, 36 (1951); see ZIMMERMANN & WENDELL, THE INTERSTATE COMPACT SINCE 1925, at 32 (1951).

[5]Hinderlider v. La Plata River & Cherry Creek Ditch Co., 304 U.S. 92, 104, 105, 107 (1938); Arizona v. California, 292 U.S. 341, 359-60 (1934); Virginia v. Tennessee, 148 U.S. 503, 527 (1893); Rhode Island v. Massachusetts, 45 U.S. (4 How.) 591, 635 (1846); Rhode Island v. Massachusetts, 37 U.S. (12 Pet.) 657, 725 (1838); see ZIMMERMANN & WENDELL, *op. cit. supra* note 4, at 31-32.

enter into an agreement; by its very terms it did not become operative until the offer had been accepted by those states. Each state had to interpret the offer in order to decide whether to accept it; therefore the consensual nature of the limitation scheme reinforces the weight which must be given to the express language employed by Congress in the Project Act. "Shorthand" (Rep. 173) or cryptic meanings gleaned from selected portions of the Senate debates, which were not communicated to the states, must not be permitted to overturn this clear literal meaning. Great weight must also be given to the administrative, practical, and legislative construction of this agreement by the parties to it and by the other basin states which are its express beneficiaries.

The Master replies that the Project Act and the California Limitation Act cannot be characterized as offer and acceptance. Section 4(a) of the Project Act, he asserts, "is not an offer but a condition precedent to the effectiveness of the Project Act" (Rep. 181). There is no such distinction even under ordinary contract law; a promise which is also a condition is a frequent ingredient of a contract. But whatever label is put on the limitation, it is clearly consensual in nature.

The Master's transmutation of the controversy

The Master further replies that if the Project Act is interpreted as an offer, it does not follow that the limitation must be given its natural and literal meaning: "Thirty years of unabated controversy," says the Master, "give unchallenged testimony that the language is *not* plain on its face." (Rep. 182; emphasis in original.) Significantly, the Master fails to define that "controversy." There have been "thirty years of unabated

controversy" about the meaning of the Compact, but there has never been any doubt, until this Report created it, that the reference in section 4(a) to the "Colorado River compact" means the Colorado River Compact signed on November 24, 1922.

California and the other basin states made a bargain with each other and with Congress in 1929. California then assumed a calculable risk: What provisions of the Compact are incorporated into the Project Act? What do those provisions mean?[6]

California should not be charged with taking the risk that the language of section 4(a) would be rewritten 30 years later so that the words refer to a different river (the "mainstream") and to classifications of water entirely unrelated to the Compact to which its words unmistakably refer. The limitation's reference to the Compact was neither modified nor excised by section 2 of the California Limitation Act, as the Master implies (Rep. 181-82).[7]

---

[6]If "Compact" means Compact, we assumed a negligible risk about the meaning of the phrase "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact" in light of the Master's confirmation of the plain meaning of Article III(a) of the Compact. (See Rep. 142-44.) The Master refuses to consider the Compact in construing the limitation and thus would destroy the basis on which we calculated that risk.

[7]Section 2 of the Limitation Act (Rep. 181, app. 398) provides: "By this Act the State of California intends to comply with the conditions respecting limitation on the use of water specified in subdivision 2 of Section 4(a) of the said 'Boulder canyon project act' and this act shall be so construed." The Master's construction of the Limitation Act makes § 2 (which is not the substantive part of the statute) more significant than § 1 which enacts the limitation in Congress' words; if the Master's interpretation of § 4(a) of the Project Act and of § 2 of the Limitation Act were correct, § 1 enacting the limitation was utterly useless.

To bolster his conclusion that "Compact" does not mean Com-

Construction by the states concerned

The bargain between Congress and California is not only an agreement between those sovereigns; it is also by its own specific terms "an express covenant" for the benefit of the six other states of the basin. The understanding of those beneficiaries, although not controlling, is relevant in interpreting what that agreement means. An examination of the expressions of spokesmen for those states reveals that the beneficiaries, including Arizona, consistently understood the terms of the bargain (as did California) to refer to the Compact in accordance with the natural and literal meaning of the language used in the Project Act and in the Limitation Act.[8]

---

pact, the Master asserts that § 2 of the Limitation Act suggests the California Legislature's awareness of *"this* ambiguity in the statutory language." (Rep. 182; emphasis added.) Whatever the Master may mean by "this ambiguity," the California Legislature certainly did not find any ambiguity in the limitation's incorporation of the Compact. The obvious purpose of § 2 was to remove any possible doubt that California intended to comply with the limitation.

[8]The supporting documents are too voluminous to be included easily within the text of this brief. We submit these bound within volume 25 of California Exhibits.

These documents were submitted to the Special Master as a part of California's Offer of Proof dated August 17, 1960, after the draft report had revealed that the basis of the decision was a contention never offered by anyone, hence never tried, that the cross reference to the Compact in § 4(a) was "inappropriate" (Rep. 173) and must be disregarded. California submitted the offer to prove that the administrative practical, and congressional construction of the Project Act and California Limitation Act for 30 years has uniformly been: "The Colorado River Compact controls the interpretation of the limitation on California set forth in the first paragraph of section 4(a) of the Project Act and in the Limitation Act as if the Compact had been fully recited therein." (Brief in Support of Calif. Offer of Proof dated Aug. 17, 1960, pp. I-1 and I-2.)

The Master rejected the offered documents on the ground that none of them, even assuming their competency, "establish any proposition that will affect the disposition of the issues in

For example, the official report of Arizona's Colorado River Commission,[1] published just after the enactment of the Project Act in December 1928, analyzed that act and concluded that section 4(a) of the act incorporated and was controlled by the Colorado River Compact and that the limitation adopted the Colorado River Compact's definitions and classifications of water from the Colorado River and its tributaries, including the Gila.[2] Arizona's published report on the meaning of section 4(a) preceded the California Legislature's enactment of the Limitation Act by over two months. Is it reasonable that California should have discerned that the limitation was devastatingly more severe to California than Arizona, reading its plain language, had said it was?

Through all the years that followed, in every available forum—in interstate conferences, before the Secretary, in Congress, and in successive trips to this Court[3]—Arizona always took the same view: "Com-

---

this litigation" (Rep. 253). We believe that ruling was clearly wrong. In any event, these documents are clearly relevant and are judicially noticeable. See, *e.g.*, United States v. Louisiana, 363 U.S. 1 (1960); United States v. Ahtanum Irr. Dist., 236 F.2d 321 (9th Cir. 1956), *cert. denied*, 352 U.S. 988 (1957).

[1]The Colorado River Commission of Arizona was an official state body charged by statute with responsibility for matters concerning the Colorado River. Act of March 7, 1927, ARIZ. LAWS 1927, ch. 37, p. 84.

[2]Calif. Ex. 7501 for iden. (Tr. 22,760). The report was dated December 31, 1928.

[3]See, *e.g.*, the following exhibits submitted as part of California's offer of proof which the Special Master rejected (Rep. 253); Calif. Exs. 7503-7504, 7506-7508, 7510-7512, 7513-C, and 7514-B, all for iden. (Tr. 22,760). For a discussion of the significance of the foregoing exhibits, as well as an analysis of Arizona's representations before Congress, see our brief dated August 17, 1960, in support of our offer of proof, pp. III-18 through 33, III-36 through 38, III-42 through 44, III-48, III-108 through 109, III-111 through 114, III-118 through 120, and III-147 through 149.

pact" in section 4(a) means Colorado River Compact.

California's Colorado River Commission,[4] a counterpart of the Arizona Commission, published its official report in September 1930, likewise interpreting section 4(a) and the then recently enacted Limitation Act as incorporating the Colorado River Compact and adopting its definitions and classifications of water.[5] California has unwaveringly taken the same position at all times.

In this present suit New Mexico and Utah stoutly resisted joinder, even in lower basin capacities. It occurred neither to their counsel, to the late Special Master who recommended their joinder, nor to this Court that they are not even proper parties—let alone indispensable parties—to a "mainstream" controversy among Arizona, California, and Nevada.

Construction by federal administrators

The consistent and reiterated administrative construction of the limitation upon California was that the limitation incorporated the Colorado River Compact, including the Compact's definitions and classifications of water.[6] The Master denies that there was any administrative construction on the theory that the United States had refused to "take sides in the Arizona-California

---

[4]The Colorado River Commission of California was an official state body charged by statute with the responsibility of Colorado River matters. Act of May 17, 1927, CALIF. STATS. 1927, ch. 596, p. 1030, § 2. Under § 5, p. 1031, the existence of the commission was to end in 1929, but it was extended two more years by CALIF. STATS. 1929, ch. 367, p. 691, § 2.

[5]Calif. Ex. 7502 for iden. (Tr. 22,760).

[6]See supporting materials collected in Calif. Offer of Proof and Brief in Support of Offer, dated Aug. 17, 1960, at III-53 through 130.

controversy." (Rep. 252.) We agree that federal administrators refused to take sides between Arizona and California on the "controversy" between them about what the Compact meant; but there was no uncertainty among the administrators about whether the Compact was incorporated into the Project Act and the Limitation Act. On that question the federal administrators did not refuse "to take sides."[7] There is and was only one view: "Compact" means Compact.

Congressional awareness and construction

Congress was aware of the consistent construction which the affected parties and the administrators had placed upon the limitation, that "Compact" means Com-

---

[7]The federal administrators had very clearly defined the "controversy" upon which they were *not* taking sides, and it was *not* the "controversy" which the Master's decision has created. For example, on January 29, 1944, Clifford E. Fix, Assistant Chief Counsel, Bureau of Reclamation, submitted a memorandum to the Solictor of the Department of the Interior prior to the hearing before the Secretary on February 2, 1944, on the proposed Arizona water delivery contract. Mr. Fix stated in the course of that memorandum: "Despite all that has been said by both states over a period of more than twenty years, there is now only one issue. The sole issue is whether the 1,000,000 acre feet provided for the lower basin by Article III(b) of the compact is unapportioned.

"While Arizona claimed for years that the Gila River and its tributaries were not to be included in the apportionment to the lower basin, it now concedes that the Gila and its tributaries are included in the waters apportioned to the lower basin under Articles III(a) and III(b). It rests its entire case on two propositions: (1) California has limited itself to 4,400,000 acre feet of apportioned water, and (2) III(b) water is apportioned water." (Calif. Ex. 7604 for iden., Tr. 22,760, at 5.) Commissioner of Reclamation H. W. Bashore concurred with the conclusions of the Fix memorandum and forwarded it to the Secretary of the Interior, along with the proposed Arizona water delivery contract which he submitted, for approval. (Calif. Exs. 7605-7606, both for iden., Tr. 22,760.) It was this "controversy" which was the basis for the language of article 10 of the Arizona contract and it was this controversy which the Secretary refused to resolve, as Secretary Ickes made perfectly clear in a decision promulgated by him contemporaneously with the execution of the Arizona

pact, and that the controversy was limited to determining the Compact provisions referred to and their meaning.[8] This same construction stems from the conduct of Congress in subsequent legislation. The most significant example ocurred in 1945 when the Senate ratified the Mexican Treaty[1] on the basis of a literal interpretation of the Project Act and the Limitation Act as incorporating the Colorado River Compact. After extensive hearings,[2] the Senate Foreign Relations Committee reported the treaty favorably.[3] The committee report states that California's contracts call for 5,362,000 acre-feet per annum, which include 962,000 acre-feet of unallocated surplus. The Compact surplus was estimated to be about 2 million acre-feet, less the 1.5 (or 1.7) million acre-feet guaranteed to Mexico.[4] Thus, the committee asserted that any curtailment of deliveries to California would be caused

---

contract in February 1944. (See Calif. Ex. 7607 for iden., Tr. 22,760, a memorandum the substance of which was published by the Secretary. (Calif. Ex. 1837 (Tr. 12,257).)

[8]See the following comments by affected states on the 1947 report by the Department of the Interior on development of the Colorado River basin: Calif. Exs. 7513-C for iden. (Tr. 22,760) at 15-16, 17-18 (Arizona); 7513-D for iden. (Tr. 22,760) at 55-56 (Colorado). Similar comments on the proposed Central Arizona Project are also pertinent: Calif. Exs. 7514-B for iden. (Tr. 22,760) at 10-11 (Arizona); 7514-E for iden. (Tr. 22,760) at 100 (New Mexico). For the administrators' view, see Ariz. Ex. 71 (Tr. 310, 3,513, 3,520-21), at 150-51, quoted in Calif. Ex. 7514-F for iden. (Tr. 22,760). For a discussion of these documents, see Calif. Offer of Proof and Brief in Support of Offer, pp. III-36, 38, 42, 45-46 (Aug. 17, 1960).

[1]45 Stat. 1219 (1945), Ariz. Ex. 4 (Tr. 220).

[2]*Hearings Before the Senate Committee on Foreign Relations on a Treaty with Mexico Relating to the Utilization of the Waters of Certain Rivers,* 79th Cong., 1st Sess. (1945).

[3]S. EXEC. REP. No. 2, 79th Cong., 1st Sess., pt. 1 (1945).

[4]The treaty guarantees 1.5 million acre-feet per annum to Mexico, subject to reduction under certain conditions or to increase to 1.7 million acre-feet when surplus waters are available. See Ariz. Ex. 4, *supra* note 1, § 10.

not by the treaty but by subjection of California's rights to the Compact which, in turn, subjects surplus waters to first call for any Mexican treaty (Article III(c)) and does not permit allocation of such surplus waters until after October 1, 1963 (Articles III(f) and III(g)).[5] The Committee Report clearly related California's 4.4 million acre-feet to Article III(a) of the Compact, not to 7.5 million acre-feet of "mainstream" water. California's exposure to the Mexican burden was related to the 962,000 acre-feet of Compact surplus recognized in the California contracts—computed on a basin-wide, not a "mainstream" basis. Thus, California's "firm" rights to 4.4 million acre-feet of "Article III(a) waters" would not be invaded.[6]

The limitation on California must be given its natural and literal meaning: "Compact" means Compact.

---

[5]S. EXEC. REP. No. 2, *supra* note 3, at 6-7. The Master quotes testimony of a California witness before the Senate committee during hearings on the treaty expressing concern that performance of the treaty might invade California's 4.4 million acre-feet of III(a) water (Rep. 251). He neglects to quote, or even cite, the Senate committee report on the treaty, which reassured California that this could not happen.

[6]See Brief in Support of Calif. Offer of Proof dated Aug. 17, 1960, pp. III-131 through 141.

PART THREE

THE MASTER ERRED IN HOLDING THAT THE BOULDER CANYON PROJECT ACT AUTHORIZED THE SECRETARY OF THE INTERIOR TO IMPOSE A FEDERAL INTERSTATE APPORTIONMENT ON THE STATES WITHOUT THEIR CONSENT, BY A "CONTRACTUAL ALLOCATION SCHEME"

Statement of the Issue

The Master holds that the Project Act authorized the Secretary, by means of water storage and delivery contracts, to "impose a federal apportionment" (Rep. 154) of "mainstream" waters on the states of Arizona, California, and Nevada; and that he did so. California's component, he holds, is determined by the limitation contained in section 4(a) of the Project Act (discussed in Part Two of this brief). The components for Arizona and Nevada are derived from a contract with Arizona and a contract with Nevada, both executed in 1944, by which the Secretary intended to effectuate the tri-state compact authorized by the second paragraph of section 4(a) but never ratified by any state. The Master concludes that the Secretary, although not required by the act to follow that formula, substantially effectuated it. The primary characteristic of this "contractual allocation scheme," as inferred by the Master, is the abrogation, as among "mainstream" users, of the principles of equitable interstate apportionment (particularly the principles of priority and protection of existing uses), previously established by this Court, and the

substitution of interstate proration in ratios derived from his interpretation of the act and contracts.

The whole "contractual allocation scheme" envisioned by the Master is an ingenious design for a nonexistent apparatus. The water service contracts exist, but the act did not contemplate that they should effectuate an interstate allocation; they do not purport to have made one; they did not make one *sub silentio;* they do not purport to abrogate interstate priorities and substitute interstate proration in the event of shortage. The limitation on California's rights is controlled by the proper interpretation of the limitation on California (discussed in Part Two *supra*), not by the Secretary's contracts with Arizona and Nevada.

The Master's construction of the Project Act and of the water delivery contracts is contradicted by the decisions of this Court, by the language of the statute, its legislative history, the statutory pattern of which it is an integral part, and its congressional, administrative, and practical construction for more than 30 years.

I. THE HOLDING IN *ARIZONA v. CALIFORNIA*, 283 U.S. 423 (1931), CONCLUSIVELY DETERMINED THAT THE PROJECT ACT DID NOT ABROGATE THE PRINCIPLES OF PRIORITY OF APPROPRIATION AND EQUITABLE APPORTIONMENT

In Arizona's first Colorado River suit, *Arizona v. California,* 283 U.S. 423 (1931), this Court held that the Project Act did not displace, except as the states

might expressly compact thereunder, the principles of priority of appropriation and equitable apportionment in the "mainstream" or any other part of the Colorado River system in the lower basin. It is 30 years too late to overturn that decision. Development in the basin has gone forward in reliance upon it; Congress has accepted and reenacted it; the parties to the suit are foreclosed by it.[1]

In that decision, this Court did not leave the parties to speculate about its holding on this issue; the Court identified it precisely (283 U.S. at 464):

> "*As we hold* that the grant of authority to construct the dam and reservoir is a valid exercise of Congressional power, *that the Boulder Canyon Project Act does not purport to abridge the right of Arizona to make, or permit, additional appropriations of water flowing within the State or on its boundaries,* and that there is now no threat by Wilbur, or any of the defendant States, to do any act which will interfere with the enjoyment of any present or future appropriation, we have no occasion to consider other questions which have been argued. The bill is dismissed without prejudice to

[1]In the 1931 suit, Arizona sued the six other Colorado River basin states and Secretary of the Interior Wilbur. 283 U.S. at 449.

an application for relief in case the stored water is used in such a way as to interfere with the enjoyment by Arizona, or those claiming under it, of any rights already perfected or with the right of Arizona to make additional legal appropriations and to enjoy the same." (Emphasis added.)

The Court's language is unmistakable. The principle laid down—that nothing in the act purports to abridge the right of Arizona to appropriate waters of the Colorado River above or below the dam either in 1931 or in the future[2]—obviously applies to every state in the basin, and not merely to Arizona alone. The Court's construction of the Project Act does not hinge upon Arizona's unilateral action ratifying or failing to ratify the Colorado River Compact. Thus the Court made clear that the source of any modification in the states' rights to appropriate, control, or use the waters of the Colorado River in the lower basin was not the Project Act, but a valid interstate agreement. Section 18 of the

---

[2]283 U.S. at 462-63. That the act did not interfere with prospective appropriations is underlined by the Court's statement that "the Act interposes no legal inhibitions" on the execution of Arizona's alleged plans "for the taking of additional water in Arizona pursuant to its laws." The Court pointed out that "Years must elapse before the project is completed. If by operations at the dam any *then* perfected right of Arizona, or of those claiming under it, should hereafter be interfered with, appropriate remedies will be available. Compare *Kansas* v. *Colorado,* 206 U.S. 46, 117." (First emphasis added.) 283 U.S. at 463.

Project Act was held to have specifically preserved those rights of the states, *inter sese*.[3]

It is equally clear that this Court held that the Project Act does not divest—except by agreement of a state—either the quantity or priority of appropriations which had already been validly made.[4]

---

[3]"The Act does not purport to affect any legal right of the State, or to limit in any way the exercise of its legal right to appropriate any of the unappropriated 9,000,000 acre-feet which may flow within or on its borders. On the contrary, section 18 specifically declares that nothing therein 'shall be construed as interfering with such rights as the States now have either to the waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of water within their borders, except as modified' by interstate agreement. As Arizona has made no such agreement, the Act leaves its legal rights unimpaired." 283 U.S. at 462.

Mr. Justice Brandeis' recognition that § 18 prohibits such an interpretation of the Project Act as the Master proposes comports with the recognition this Court has often given similar "savings clauses" as precluding supersedure or nullification of existing state law by federal legislation. See, *e.g.*, FPC v. Niagara Mohawk Power Corp., 347 U.S. 239, 252 & n.17 (1954) (§ 27 of the Federal Power Act) (Mr. Justice Douglas, joined by Justices Black and Minton, dissented on other grounds but agreed "that the Federal Power Act was not intended to interfere with water rights created by state law." 347 U.S. at 258); United States v. Gerlach Live Stock Co., 339 U.S. 725 (1950) (§ 8 of the Reclamation Act of 1902).

[4]283 U.S. at 460-61. See also Arizona v. California, 298 U.S. 558, 570 (1936), the *Judicial Apportionment* suit, in which the Court said: "[I]t is evident that the United States, by Congressional legislation and by acts of its officers which that legislation authorizes, has undertaken, in the asserted exercise of its authority to control navigation, *to impound, and control the disposition of, the surplus water in the river not already appropriated*. The defendant states contend, and Arizona does not deny, that the natural dependable flow of the river is already overappropriated, and it does not appear that without storage of the impounded water any substantial amount of water would be available for appropriation.

"The decree sought has no relation to any present use of the water thus impounded which infringes rights which Arizona may assert subject to superior but *unexercised powers* of the United States." (Emphasis added.)

The Court's definition of the phrase "to appropriate water" makes clear that the Court understood the term and did not use it in any esoteric sense (283 U.S. at 459):

> "To appropriate water means to take and divert a specified quantity thereof and put it to beneficial use in accordance with the laws of the State where such water is found, and, by so doing, to acquire under such laws, a vested right to take and divert from the same source, and to use and consume the same quantity of water annually forever, subject only to the right of prior appropriations."[5]

It is 30 years too late to consider the proposal implicit in the Master's Report that this Court's 1931 decision in *Arizona v. California* should be overruled.[6] Since that decision, development in the lower basin, including construction of Hoover Dam and of great agricultural and domestic projects in California, has gone forward. (See Rep. 32-33, 53-71.)

Congress likewise accepted and acted upon this Court's 1931 holding when it appropriated funds to

---

[5] *Accord,* Arizona v. California, 298 U.S. 558, 565-66 (1936).

[6] The Master proposes to distinguish this Court's decision out of existence. (Rep. 158-60.) Neither Arizona's purported ratification of the Compact in 1944, nor the operation of the dam and reservoir anticipated by the Court in 1931, provides any basis for overturning this Court's construction of the Project Act. The meaning of Congress' words in 1928, as construed in 1931, has not changed by reason of the acts and conduct of third persons during the period 1931-1961. Indeed, the acts and conduct of Congress, of the administrators of the act, and of the states are consistent with the Court's construction of the Project Act in 1931, and wholly inconsistent with the Master's construction of the Project Act in 1960.

build Hoover Dam,[7] as well as in 1937, when Congress appropriated funds for the Gila Project in Arizona.[8]

Congress adopted substantially the language of section 18 of the Project Act, and therefore the construction of that language,[9] in section 14 of the Boulder Canyon Project Adjustment Act of 1940.[10]

The Court reaffirmed its view of the Project Act in the *Parker Dam* case, *United States v. Arizona,* 295 U.S. 174, 183 (1935):

> "Arizona owns the part of the river bed that is east of the thread of the stream . . . . Her jurisdiction in respect of the appropriation, use and distribution of an equitable share of the waters flow-

---

[7]From 1930 through 1956, $282,693,055 was appropriated for construction and operation and maintenance of Hoover Dam and power plant. See BUREAU OF RECLAMATION, U.S. DEP'T OF THE INTERIOR, CUMULATIVE SUPPLEMENT TO BUREAU OF RECLAMATION APPROPRIATION ACTS AND ALLOTMENTS 210, 245-49 (1957).

[8]During the hearings on appropriations for the Gila Project, Commissioner of Reclamation Page transmitted to the House committee considering the measure (see *Hearings Before a Subcommittee of the House Committee on Appropriations on the Interior Department Bill for 1938,* 75th Cong., 1st Sess. 1675-81, 1807-63 (April 12, 20-21, 1937)), the opinion, dated April 14, 1937, of Acting Solicitor Kirgis. The Acting Solicitor quotes from the language of the 1931 decision upon which we rely and then concludes: "The decision of the Supreme Court seems to leave Arizona in a position to appropriate any unappropriated water of the Colorado River if it could put such water to beneficial use, and this without reference to authority given by Congress in the Boulder Canyon project act." Calif. Ex. 7754 for iden. (Tr. 22,760). Commissioner Page's transmittal of April 16, 1937, to the House Committee on Appropriations is Calif. Ex. 7756 for iden. (Tr. 22,760). The appropriation of funds for the Gila Project was made by the Act of Aug. 9, 1937, 50 Stat. 564, 595 (1937).

[9]"In adopting the language used in the earlier act, Congress 'must be considered to have adopted also the construction given by this Court to such language, and made it a part of the enactment.'" Shapiro v. United States, 335 U.S. 1, 16 (1948), quoting with approval Hecht v. Malley, 265 U.S. 144, 153 (1924).

[10]54 Stat. 779, 43 U.S.C. § 618m (1958).

ing therein is unaffected by the [Colorado River] Compact or federal reclamation law."[1]

II. EVEN IF THE ISSUE WERE NOT CONCLUDED BY *ARIZONA v. CALIFORNIA, SUPRA,* THE PROJECT ACT DOES NOT ABROGATE, BUT PRESERVES, PRIORITY AND EQUITABLE APPORTIONMENT PRINCIPLES

Even if the construction of the Project Act were an original question (which it is not), it is abundantly clear that the Project Act both expressly and by necessary implication preserves priority and equitable apportionment principles within the lower basin except as modified by effective interstate agreement.

A. Project Act Sections 18, 14, 8, and 4 Preserve Priority and Equitable Apportionment Principles

Sections 18, 14, 8, and 4 plainly manifest Congress' intention to preserve existing western water law.[2]

1. *Section 18*

Section 18[3] requires compliance with state law intrastate and with the "federal common law"[4] of priority and equitable apportionment interstate,[4a] "except as

---

[1]The Court had earlier defined federal reclamation law as the Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof and supplemental thereto, "including the Boulder Canyon Project Act." 295 U.S. at 180 n.2.

[2]*Accord,* Colorado River Storage Project Act § 7, 70 Stat. 109 (1956), 43 U.S.C. § 620f (1958).

[3]Section 18 of the Project Act provides:

"Nothing herein shall be construed as interfering with such rights as the States now have either to the waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters within their borders, except as modified by the Colorado River compact or other interstate agreement."

[4]"Federal common law" is Mr. Justice Brandeis' phrase in Hinderlider v. La Plata River & Cherry Creek Ditch Co., 304 U.S. 92, 110 (1938).

[4a]As construed in Arizona v. California, 283 U.S. 423, 462, discussed *supra.*

modified by the Colorado River compact or other interstate agreement." That requirement is buttressed by section 14 of the act, making the act a supplement to the reclamation laws and subjecting it to the control of the reclamation laws "except as otherwise herein provided."[5] The provisions of section 18 read with section 14 unmistakably establish Congress' intention to incorporate section 8 of the 1902 act[6] and to make clear that nothing in the Project Act provides "otherwise."

Congress' intent to preserve existing law, plainly manifested by the language of section 18, is confirmed by the legislative history of that section. Section 18 became part of the Swing-Johnson bill on December 14, 1928.[7] Senator King, the author of section 18, was a staunch opponent of federal control of water rights. Typical of Senator King's view is his statement to the Senate eight days before section 18 became a part of the bill:[8]

> "If the Senator means by his statement that the Federal Government may go into a stream, whether it be the Colorado River, the Sacramento

---

[5]Section 14 provides: "This Act shall be deemed a supplement to the reclamation law, which said reclamation law shall govern the construction, operation, and management of the works herein authorized, except as otherwise herein provided." Section 12 defines "reclamation law."

[6]Section 8 of the Reclamation Act of 1902, 32 Stat. 390, 43 U.S.C. §§ 372, 383 (1958), quoted *supra* p. 63, was given interstate effect in Nebraska v. Wyoming, 325 U.S. 589, 612-15 (1945).

[7]70 CONG. REC. 593.

[8]70 CONG. REC. 169 (Dec. 6, 1928). Senator King was addressing Senator Hayden who hastened to agree with Senator King. *Ibid.* This is not an isolated example of congressional intent. The same view of Congress' power was repeated many times during the debate on the Swing-Johnson bills by almost every member of Congress who had anything to do with the legislation. See *infra* pp. 179-80 note 8, 181-83, 186.

River, or a river in the State of Montana, and put its powerful hands down upon the stream and say, 'This is mine; I can build a dam there and allocate water to whom I please, regardless of other rights, either suspended, inchoate, or perfected,' I deny the position which the Senator takes."

The Master limits section 18 to an *intrastate* effect. (Rep. 217, 240.) His construction distorts the language of that section and renders the phrase "except as modified by the Colorado River compact or other interstate agreement" meaningless. Obviously, *intrastate* rights are not modified by the Colorado River Compact.[9] Nor do we know of any interstate compact ever negotiated, or even proposed, to effect an allocation of waters intrastate.

2. *Section 14*

Section 14 of the Project Act,[1] incorporating section 8 of the Reclamation Act of 1902, likewise compels recognition of prior appropriation and equitable apportionment principles. Congress' intent, evident from the language of section 14, is confirmed by the legis-

---

[9]See Art. IV(c): "The provisions of this article [IV] shall not apply to or interfere with the regulation and control by any State within its boundaries of the appropriation, use, and distribution of water." Rep. app. 375. Only Article IV contains any provisions that might conceivably have intrastate effect.

[1]"This Act shall be deemed a supplement to the reclamation law, which said reclamation law shall govern the construction, operation, and management of the works herein authorized, except as otherwise herein provided" (Rep. app. 394). Section 12 of the Project Act defines "reclamation law" as used in the Project Act as "that certain Act of Congress of the United States approved June 17, 1902 . . . ." (Rep. app. 392.)

lative history of that section. Congress in the Project Act did not intend, according to its coauthor, Representative Swing, "to create or to assert or to deal in or to dispose of water rights."[2] On the contrary, both Representative Swing,[3] the House author of the

---

[2]Representative Swing, speaking on the third Swing-Johnson bill, said in *Hearings on H.R. 9826 Before the House Committee on Rules,* 69th Cong., 2d Sess. 116 (1927):

"On the question of Arizona's rights in and to the water of the river, let me say that the Government is not undertaking to create or to assert or to deal in or to dispose of water rights. It proposes to go in and construct a dam and store water for reasons which have been set out, and then it turns the water loose. The Secretary's power, as given by this act is not to sell water. The act says 'The Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water.' Whose water? It does not say. It might be a community like Imperial Valley that has already acquired a water right, and wants its water stored, or it may be someone who hereafter will acquire a water right, but that right will not be acquired under this bill; not from the United States Government. He will acquire his water right, if he acquires one, from the State and under the laws of the State, in which he puts the water to a beneficial use. There is nothing in this bill which puts the Government in conflict with the water laws of Arizona or Utah or any other State. As a matter of fact, the reclamation law is adopted by section 13 [§ 14 of the bill as enacted] of this bill, and section 8 of the reclamation act says that what the Government does must not be in conflict with the water laws of the States, so there can be no violence done State laws on this score.

"If the water is used in Arizona, the water right must be acquired under the laws of Arizona; if in Nevada, under the laws of Nevada; if in California, under the laws of California." (Bracketed words added.)

[3]See note 2 *supra.*

bill, and Senator Johnson,[4] the Senate author, explained that the intent was to preserve beneficial use as the basis, the measure, and the limit of water rights, in accordance with section 8 of the Reclamation Act to which the Project Act by section 14 was made a supplement. The bill which both its authors assured Congress had nothing to do with creating water rights then contained the words of section 5 of the act[5] upon

---

[4]On February 21, 1927, Senator Johnson, speaking on the third Swing-Johnson bill, said on the floor of the Senate (68 CONG. REC. 4291):

"I repeat to you that this is a reclamation measure, made so by section 13 [now 14] of the bill. Adverting, then, to section 8 of the reclamation law, let us see how much there is in this statement that is made about appropriating the water of Arizona and taking the property of that State.

"Section 8 of the reclamation act provides:

" 'That nothing in this act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this act, shall proceed in conformity with such laws, and nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof.'

"So, first, our act is a reclamation act.

"Secondly, under the reclamation law we can no more affect the rights of Arizona in the waters that flow through Arizona than we could affect the title of any Arizona resident to any particular property. In passing, I may remark that it is entirely a misnomer to say that Arizona or any other State in the West, after all, has title to water. Under western law, the appropriator of water has a title to the use when the application is beneficially made of the water that he thus appropriates; but to talk of title of the State to water is entirely a misapprehension and misapplication of terms." (Bracketed words added.)

[5]*House:* H.R. REP. No. 1657, 69th Cong., 2d Sess., pt. 1, at 31 (Dec. 22, 1926); Calif. Ex. 2053 for iden. (Tr. 11,177) at 19. *Senate*: S. 3331, 69th Cong., 1st Sess. (1926); Calif. Ex. 2055 for iden. (Tr. 11,177) at 18, 19. For a brief discussion of § 5, see S. REP. No. 654, 69th Cong., 1st Sess., pt. 1, at 26-27 (April 19, 1926).

which the Master principally relies to reach the opposite conclusion.[6] It is apparent that, contrary to the Master, the authors of the bill did not construe the language of section 5 as providing "otherwise."

The Master's restriction of section 8 of the Reclamation Act of 1902, incorporated into the Project Act by section 14, to intrastate consequences is contrary to this Court's decisions applicable to the interpretation of the reclamation laws of which the Project Act is a part. Section 8 of the Reclamation Act of 1902 has been held unequivocally to apply to interstate rights in an interstate stream.[7]

Water rights in the "mainstream" or in any other part of the Colorado River system in the lower basin which are administered under the reclamation law are controlled by section 8 of the Reclamation Act of 1902; they are not created by water delivery contract. Contracts executed by the Secretary of the Interior pursuant to section 5 of the Project Act, like other reclamation contracts, are merely a step in the acquisition of water rights which come into being by diligence in putting the waters to beneficial use in accordance with the principles of priority of appropriation and equitable apportionment.

This proposition has been conclusively established

---

[6]Rep. 151-53; see discussion *infra* pp. 168-91.

[7]Nebraska v. Wyoming, 325 U.S. 589, 612-15 (1945). See Wyoming v. Colorado, 259 U.S. 419, 463-71 (1922).

by this Court's decisions in *Ickes v. Fox*[8] and *Nebraska v. Wyoming*,[9] involving several varieties of reclamation

---

[8]300 U.S. 82 (1937). In that case the Court declared:

"Although the government diverted, stored and distributed the water, the contention of petitioner [Secretary of the Interior] that thereby ownership of the water or water-rights became vested in the United States is not well founded. Appropriation was made not for the use of the government, but, under the Reclamation Act, for the use of the landowners; and by the terms of the law and of the contract already referred to, the water-rights became the property of the landowners, wholly distinct from the property right of the government in the irrigation works." *Id.* at 94-95.

In a later installment of the same litigation, the Court of Appeals for the District of Columbia stated the basis of the Supreme Court's decision:

"Reading the Reclamation Act in the light of the decision in Ickes v. Fox, we find the situation in this case to be as follows: The water-rights of appellants are not determined by contract but by beneficial use. The Secretary of the Interior in operating the project is in the position of a carrier of water to all entrymen in the Reclamation project. He is not obligated to furnish any more water than is available. Under the Reclamation Act he is not authorized to furnish any water at all except for beneficial use. He must distribute the available water according to the priorities among the different users which are established by the law of the State of Washington. He has no concern in disputes between the various entrymen which concern their respective priorities, other than as a stakeholder. He can only make such charges to reimburse the Reclamation Fund for the construction of the project as are provided in the Reclamation Act itself." Fox v. Ickes, 137 F.2d 30, 33 (D.C. Cir. 1943), *cert. denied*, 320 U.S. 792 (1943).

[9]The rule announced in Ickes v. Fox was followed in Nebraska v. Wyoming, 325 U.S. 589, 614 (1945), in which Mr. Justice Douglas quoted the language of Ickes v. Fox set out in note 8 *supra* and added:

"The property right in the water right is separate and distinct from the property right in the reservoirs, ditches or canals. The water right is appurtenant to the land, the owner of which is the appropriator. The water right is acquired by perfecting an appropriation, i.e., by an actual diversion followed by an application within a reasonable time of the water to a beneficial use. . . . Indeed § 8 of the Reclamation Act provides as we have seen that 'the right to the use of water acquired under the provisions of this Act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right.'"

contracts identical to those utilized by the Secretary of the Interior to administer "mainstream" waters under the Project Act.[10]

Administrators of the Project Act have consistently construed the act as a supplement to the reclamation law. Every water delivery contract executed recites that it is executed pursuant to the Reclamation Act of 1902.[1] The United States has executed just about every species of contract recognized under the Reclamation Act of 1902 and acts supplementary and amendatory thereto with users of "mainstream" waters. These include "water right applications" both before and after enactment of the Project Act, which on approval by the

---

[10]Ickes v. Fox, note 8 *supra*, involved a reclamation contract with a water users association and water right applications by individual water users on the Yakima Project on the Yakima River in Washington. 300 U.S. at 88-90. Nebraska v. Wyoming, note 9 *supra*, involved reclamation contracts under the North Platte Project with "landowners or irrigation districts" on the North Platte River in Nebraska and Wyoming, as well as Warren Act contracts. 325 U.S. at 594-95.

[1]See Rep. app. 399, 409, 419, 423. All but a few of the main stream water delivery contracts in evidence are tabulated in appendix F, vol. 2, Calif. Findings and Conclusions. Not included in that tabulation are (1) the sample water right applications for the Yuma Project in Arizona and California discussed *infra* note 2; (2) early contracts (superseded in the early 1950's) between the Secretary of the Interior and the organizations representing the users in the North Gila Valley in Arizona (Ariz. Ex. 91 (Tr. 356) dated Sept. 24, 1918, superseded by Ariz. Ex. 95 (Tr. 360) dated May 12, 1953) and in the Yuma Valley in Arizona (U.S. Ex. 19-T (Tr. 15,518) dated May 31, 1906, superseded by Ariz. Ex. 92 (Tr. 357) dated June 15, 1951); and (3) the contract, executed since the trial concluded, between the Secretary of the Interior and the City of Yuma, Arizona (Calif. Ex. 7611 for iden. (Tr. 22,760)).

Secretary become contracts with individual water users,[2] standard water delivery contracts with irrigation districts or water user associations (also before and after enactment of the Project Act),[3] Warren Act contracts,[4] and "special use" contracts.[5] Arizona's Warren Act contracts recite that they are made under the Reclamation Act of 1902 and its supplements, expressly including the Project Act and the Warren Act.[6] The Arizona "special use" contracts similarly recite the Reclamation Act of 1902, with special reference to the Project Act, the "special use" statute of February 25, 1920,[7] and the individual project authorization statutes.

The Special Master holds that all contracts for diversion and use of "mainstream" waters which have been executed by the United States meet the requirements of section 5 of the Project Act, with one minor exception not relevant here.[8] These include contracts described above which were executed pursuant to the reclamation laws *prior to* enactment of the Project Act.

---

[2]Ariz. Ex. 168 (Tr. 2,262) (Yuma Project, Arizona, sample water right application dated 1917); Calif. Exs. 378, 379, 380 (Tr. 8,852) (Yuma Project, California, sample water right applications dated 1917, 1910, 1948, respectively).

[3]*E.g.*, U.S. Ex. 19-T (Tr. 15,518) and Ariz. Ex. 92 (Tr. 357) (Yuma County Water Users' Association); Ariz. Ex. 93 (Tr. 359) (Wellton-Mohawk Irrigation and Drainage District). See note 1 *supra*, item (2).

[4]Seventeen Arizona Warren Act contracts are in evidence as part of Ariz. Ex. 165 (Tr. 2,247), 16 of which are tabulated in Ariz. Ex. 163 (Tr. 2,223).

[5]Eleven Arizona "special use" contracts are included in Ariz. Ex. 165, and are tabulated in Ariz. Ex. 163, note 4 *supra*.

[6]36 Stat. 925 (1911), 43 U.S.C. §§ 523-25 (1958).

[7]41 Stat. 451, 43 U.S.C. § 521 (1958).

[8]Rep. 205-21. The Master holds invalid a contract dated June 12, 1945, between the United States and the Arizona Edison Company for a term extending to December 31, 1970, because it is not for "permanent service" required by § 5 of the Project Act. (Rep. 220-21.)

One of the water right contracts to which the Master refers (Rep. 212 n.75) is California Exhibit 379 (Tr. 8,852), a 1910 water right application contract with one Adolph Kunz on the Reservation Division of the Yuma Project located in California. It is like the water right applications with reclamation project water users on the Salt River Project in the Gila River basin,[9] and indeed, all over the West. It is in evidence as representative of a great many identical contracts with other users on the Reservation Division.[10]

Clearly Mr. Kunz, by this contract in 1910, did not become either beneficiary or victim of a Secretarial allocation consisting of a pro rata share in waters available to three states from the future Hoover Dam. It would seem equally clear that the water right Mr. Kunz acquired in 1910 is the same water right which Mr. Kunz (his heirs, devisees, or assigns) has today.

The Reservation Division of the Yuma Project on which Mr. Kunz secured a water right in 1910 was recognized in California's Seven-Party Priority Agreement, in the Secretary of the Interior's General Regulations, and in the water delivery contract with each California defendant agency written since the Project Act was passed, as having a second priority, junior only to Palo Verde Irrigation District's first priority.[11] No contract other than standard reclamation law water delivery applications with individual water users, some executed before and some since the Project Act, has ever been negotiated for the Bard Irrigation District, the non-Indian portion of the Reservation Division of the Yuma

[9] *E.g.*, U.S. Exs. 30 and 31 (Tr. 15,537 and 16,146).
[10] Calif. Ex. 381 (Tr. 8,855); Tr. 8,853-55 (Steenbergen).
[11] See, *e.g.*, Palo Verde contract, Rep. app. 425.

Project.[12] If there is a "contractual allocation scheme," Mr. Kunz's contract is one of the components of the scheme. But the authorization for such a scheme did not become law until 19 years after the Kunz contract.

Similarly, on the Arizona side of the river in the Yuma area, standard reclamation contracts were the only contracts controlling deliveries to the users on the Valley Division of the Yuma Project and in the North Gila Valley, adjacent to the Yuma Project, until the early 1950's.

In 1906, the Secretary of the Interior executed a water delivery contract with the Yuma County Water Users' Association[1] which remained in effect until 1951, when the same parties executed a supplemental contract under which present deliveries are made.[2] The 1951 contract, while it states that it is made pursuant to the Reclamation Act of 1902 as amended and supplemented, does not expressly state that it is made pursuant to the Boulder Canyon Project Act.[3] However, section 12(a) provides that water deliveries thereunder will be subject to the Colorado River Compact and the Project Act. Likewise, in 1918, the Secretary of the Interior executed a contract with the North Gila Valley Irrigation District providing for the continued delivery of water to the North Gila Valley, even though the area had not been officially included within the Yuma Project area by the Secretary of the Interior.[4] It was not until 1953 that a supplemental water delivery contract was executed between the same parties.[5] The 1953 contract

---

[12]Tr. 8,819-20 (Steenbergen); Calif. Ex. 50 (Tr. 6,898).
[1]U.S. Ex. 19-T (Tr. 15,518).
[2]Ariz. Ex. 92 (Tr. 357).
[3]*Id.* at art. 1.
[4]Ariz. Ex. 91 (Tr. 356).
[5]Ariz. Ex. 95 (Tr. 360).

states that it is made pursuant to the Reclamation Act of 1902 as amended and supplemented, specifically citing the Boulder Canyon Project Act.[6]

The 1953 contract with the North Gila Valley Irrigation District calls for the delivery of sufficient stored water from Lake Mead, "including all other waters diverted for use within the District from the Colorado River," as may be ordered by the district and reasonably required, subject, in part, to "the express understanding and agreement that such rights, if any, as the District or the landowners within the District may have heretofore acquired to the use of water from the Colorado River, are unimpaired by this contract."[7] The 1951 contract with the Yuma County Water Users' Association calls for the delivery of sufficient stored water in Lake Mead, "including all other water diverted for use within the division from the Colorado River *System*" (emphasis added) as may be ordered by the district and reasonably required, subject, in part, to "the express understanding and agreement that such rights, if any, as the Association or the landowners within the division may have heretofore acquired to the use of water from the Colorado River are unimpaired by this contract."[8] The only right that any user in either area had is a right which arose prior to the enactment of the Project Act by virtue of beneficial use pursuant to an appropriation under Arizona law. The Project Act did not unilaterally transform any early right, with priority applicable interstate and protected under the doctrine of equitable apportionment, into a pro rata share of a contractual allocation never

---

[6] *Id.* art. 1.
[7] *Id.* arts. 5 and 5(d).
[8] Ariz. Ex. 92 (Tr. 357), arts. 12(a) and 12(a)(4).

fully accomplished, under the Master's thesis, until 1944 when the Secretary executed the contract with the State of Arizona. Further, it is obvious that the Secretary of the Interior did not consider it necessary to execute new contracts with the users in the North Gila Valley and the Yuma Valley pursuant to the broad powers which the Special Master finds Congress delegated to the Secretary under section 5. Obviously, the Secretary concluded that the earlier reclamation contracts satisfied the mandate of section 5, if any contract at all were necessary, just as the Master considers that water right application contracts with users in the Bard District in California meet the Project Act requirement.

If there is a contractual allocation scheme, it never came to fruition, if at all, until 1944 when the Arizona water delivery contract was executed. Yet the 1906 and 1918 contracts must have been components of a Secretarial scheme of some variety prior to 1944, since they coexisted with the California contracts. What was the contractual allocation scheme during that 15-year period? If those contracts were part of any allocation, their execution preceded by 23 and 11 years, respectively, the enactment of the purported authorization for such a scheme.

Unless the wide variety of water delivery contracts described at Rep. 205-14 serves a different function on the Colorado River system than this Court has held they serve on the Yakima River in Washington and the North Platte River in Nebraska and Wyoming,[9] water rights thereunder are controlled by section 8

---

[9]See pp. 151-52 notes 8 & 10 *supra* for discussion of Ickes v. Fox, 300 U.S. 82 (1937), and Nebraska v. Wyoming, 325 U.S. 589 (1945).

of the Reclamation Act of 1902, whether the contract is for delivery of "mainstream" water or for waters of the Gila River system.

3. *Sections 8(a) and (b) and 4(a), First Paragraph*

This Court's previous construction of Project Act sections 14 and 18[10] is likewise consistent with the provisions of sections 8(a) and (b) and 4(a), first paragraph. Thus, section 8(a) and (b) expressly applies to "all users and appropriators of water stored" behind Hoover Dam. If the Project Act abrogated appropriations (other than "present perfected rights," a term not used in section 8(a) and (b)), the word "appropriators" is not only misused, it is misleading. No purpose other than an interstate purpose could conceivably be served by section 8(a) and (b). The first paragraph of section 4(a) defining the terms of the limitation upon California specifies that there must be included all water needed to supply "any rights which may now exist." Those rights must refer to interstate rights under equitable apportionment principles, including priority of appropriation, since no other basis for interstate rights was then recognized in the lower basin.

B. Legislative History and Administrative and Practical Construction of the Project Act Confirm Preservation of Priority and Equitable Apportionment Principles

Congress did not leave its intent to be derived by implication. But if Congress had omitted sections 14 and 18 of the Project Act and if it were necessary to ascertain Congress' intent by inferences drawn from other provisions of the statute, from its legislative his-

---

[10]Arizona v. California, 283 U.S. 423 (1931), and United States v. Arizona, 295 U.S. 174, 183 (1935), discussed pp. 140-45 *supra*.

tory, from its administrative and practical construction, and from the pattern of similar legislation, the inferences which could properly be drawn from those sources sustain one conclusion only: The Project Act preserved priority of appropriation and equitable apportionment in the "mainstream" and in every other part of the Colorado River system in the lower basin.

1. *Legislative History*

As we have seen (*supra* pp. 146-50), Congress was repeatedly informed during the debates on the third and fourth Swing-Johnson bills, both in the House and in the Senate: (1) that the prior appropriation doctrine was universally adopted throughout the arid West; (2) that the appropriation doctrine applied across state lines under the decision of this Court in *Wyoming v. Colorado;* and (3) that section 8 of the Reclamation Act of 1902, incorporated in the Project Act by reference, conferred federal approval upon the principles of prior appropriation.

If Congress intended to abrogate, change, or modify what it knew was the settled existing law, the inference is inescapable that it would have expressed itself clearly on that subject. Congress did express itself clearly. Congress, on three occasions in the Project Act, expressly authorized modification of these principles—not by congressional or administrative fiat—but by authorizing or approving effective interstate agreement: (1) Congress authorized and approved the Colorado River Compact, modifying the law of equitable apportionment basin versus basin (section 13 and section 4(a), first paragraph); (2) Congress specified the terms of the limitation which California was to

impose upon herself, stating the maximum quantitative use to which California was entitled, thus *pro tanto* qualifying the operation of equitable apportionment (section 4(a), first paragraph); (3) Congress authorized a tri-state compact among Arizona, California, and Nevada which, if it had been ratified and become effective, would have affected equitable apportionment by compact apportionment to Arizona and Nevada (section 4(a), second paragraph), but this compact was not ratified by any state.[1] Since Congress expressed itself clearly on the precise subject, the inference is clear that the omission to abrogate, to alter, or to limit equitable apportionment and priority of appropriation other than as specified is deliberate and purposeful: Congress intended to preserve unchanged that which it did not expressly qualify.

The administrative, practical, and congressional construction of the statute confirms the analysis of the language, purpose, and legislative history that the Project Act does not nullify priority and equitable apportionment.[2]

---

[1]Of course, under the general authorization of § 19, any of the Colorado River basin states could have entered into subsidiary compacts supplemental to the Colorado River Compact which might have modified the principle of equitable apportionment, but no such compact has ever been executed in the lower basin (Rep. 29).

[2]All of the materials herein cited relating to administrative, congressional, and practical construction are either received in evidence or judicially noticeable. *E.g.,* United States v. Louisiana, 363 U.S. 1 (1960). The exhibits marked for identification which are discussed below are the materials which we submitted to the Special Master in an offer of proof rejected by the Report (pp. 248-53). In addition to the materials set forth *infra,* see administrative construction of § 14 of the Project Act, *supra* pp. 152-58.

2. Subsequent Congressional Construction

During the hearings on the first appropriation bill for the construction of Hoover Dam, Senator Hayden argued:[3]

> "What will happen is that the waters of the Colorado River will be impounded in the Boulder Canyon Reservoir and made available for use; large quantities of water will be taken out of the Colorado River into the great all-American canal; over 1,000,000 acre-feet will be further taken out of the river by a pumping plant, and taken over into the coastal plain of California in the vicinity of Los Angeles; they will be put to beneficial use; and, *once having acquired a prior right to its use, no other State can obtain the use of those waters.*" (Emphasis added.)

Senator Hayden made similar assertions during the Senate debates in opposing that appropriation bill.[4] Senator Hayden later inserted in the *Congressional Record* the text of a letter from Chairman Charles B. Ward of the Colorado River Commission of Arizona to Colonel William J. Donovan, commenting on the failure of the 1929 tri-state negotiations:[5]

"We knew that if a tri-State compact was not

[4] 72 CONG. REC. 11775-76 (1930).

[5] *Id.* at 11,803, 11,804. The Commission was an official body in Arizona, charged by statute of its state with responsibility for Colorado River system matters, including negotiations with other states and the federal government and the issuance of reports and bulletins. ARIZ. LAWS 1927, ch. 37, pp. 84, 86, 87. Charles B. Ward is identified in Calif. Ex. 1351 for iden. (Tr. 11,436) as its chairman as of Aug. 1, 1929.

Colonel Donovan was the federal representative in the tri-state negotiations referred to by Mr. Ward.

made with California, that California would have the right of prior appropriation against our State as to the waters allocated to the lower basin, and with her wealth, power, and influence Arizona would soon find that the Colorado River water would be of no benefit to her."

Congress subsequently appropriated the funds to begin construction of Hoover Dam.[6]

In 1940, Congress enacted section 14 of the Boulder Canyon Project Adjustment Act[7] in almost the identical language of section 18 of the Project Act. This section in the Project Act was the basis of the Court's explicit holding in *Arizona v. California,* 283 U.S. 423, 462 (1931), that appropriation is not abrogated by the Project Act, except as the states agree. Its adoption, nine years after this decision, constitutes congressional acceptance of the judicial interpretation.

3. *Administrative and Practical Construction*

On July 31, 1930, the Acting Secretary of the Interior informed the attorneys for the Palo Verde Irrigation District in California that Hoover Dam storage would not interfere with the prior rights to the use of the river, for which no contract would be required.[8]

The battle waged in 1937 by the six states which had ratified the Colorado River Compact against the request for appropriations for the Gila Project (diverting main stream waters at Imperial Dam) in Arizona produced further administrative affirmations of the priority doctrine. An interoffice memorandum dated April 9, 1937, to Commissioner of Reclamation Page from

counsel for the Reclamation Bureau points out that this new project must be subject to prior rights of earlier contractors.[9]

> "Contracts have heretofore been made for the sale of water in California in accordance with the compact rights of California, and the sale of water for use on the Gila project in Arizona must be subject to the rights of such California contractors, as well as to the rights of any other contractors in the six States for a water supply from the Colorado River under the compact."

On April 14, 1937, Acting Solicitor of the Interior Kirgis delivered to the Commissioner an opinion that under this Court's 1931 decision Arizona was free to appropriate any unappropriated water of the Colorado River it could put to beneficial use, independent of the Project Act.[1] On April 16, 1937, Commissioner Page communicated the same principle to Ward Bannister of Colorado who had protested the sale of Lake Mead water to the Gila Project without Arizona's ratifying the Compact. Commissioner Page again stated that prior rights of earlier contractors in California and elsewhere in the basin would be respected.[2] On the same date, Commissioner Page transmitted these last two documents[3] to the House Committee on Ap-

[2]Calif. Ex. 7755 for iden. (Tr. 22,760): "Contracts have been made for the sale of water in California in accordance with the compact rights of California, and the sale of water for use on the Gila project in Arizona must be subject to the rights of such California contractors as well as to the rights of any other contractors in the six states for a water supply from the Colorado River under the compact."

[3]Calif. Exs. 7754 and 7755, both for iden., *supra* notes 1 & 2.

propriations which was considering the appropriations for the Gila Project.[4] President Roosevelt, on June 21, 1937, approved a finding of feasibility for the Gila Project[5] in which it was again pointed out that sales of water to Gila Project users were subjected to prior contracts made under the Project Act and to superior treaty rights.[6] In August 1937, funds were appropriated for the Gila Project.[7]

Arizona's conduct of her Colorado River matters is consistent only with the construction of the Project Act that preexisting western water law was preserved by that act. Arizona did not secure a water delivery contract with the Secretary until 1944. At all times, however, users in Arizona, both with and without contracts, have ordered and received "mainstream" water for consumptive use.[8] In 1935, Arizona sued the six other Colorado River basin states for "a judicial apportionment among the states in the Colorado River basin of the *unappropriated water of the river* . . . ."

[4]Calif. Ex. 7756 for iden. (Tr. 22,760).

[5]Ariz. Ex. 60 (Tr. 269), at 126.

[6]*Id.* at 123: "In all sales of water rights [for the Gila Project] it will be necessary to prescribe that the water supply of the project is subject to the Colorado River compact, and to the Boulder Canyon Project Act and to the sales of water under the compact and said act and to the treaty which it is anticipated will be made with Mexico fixing that country's rights in the flow of the Colorado River."

[7]Act of Aug. 9, 1937, ch. 570, 50 Stat. 595.

[8]On plate 3 *infra* we present a schematic diagram of "mainstream" users in Arizona and California, both with and without water delivery contracts. This diagram illustrates that "mainstream" waters have been diverted for use in Arizona without contracts, both in the past and presently. For example: The city of Yuma, whose water rights stem from an 1893 appropriation, did not obtain a water delivery contract with the Secretary of the Interior until 1960, after this trial had ended. The South Gila Valley in the Gila Project, Arizona, is irrigated in part by private pumping without contracts.

Arizona v. California, 298 U.S. 558, 560 (1936) (emphasis added). Arizona had no water delivery contract when she brought that suit, and she did not name the Secretary of the Interior as a defendant.[9]

On February 26, 1948, the State of Nevada, as provided by statute,[10] submitted its comments on the Secretary of the Interior's report on the Central Arizona Project. These comments are a practical construction of the Project Act that, absent a lower basin compact, priority controls intrabasin rights, even though this construction operates against Nevada's interests.[11]

4. *Statutory Scheme of the Reclamation Law*

The Boulder Canyon Project Act must be construed not only as a part of the reclamation laws (*supra* pp.

---

[9]Arizona alleged "that to apply the doctrine of appropriation as the law governing an equitable apportionment of the waters of said river among the plaintiff and the defendants, and particularly between Arizona and California, under the facts alleged in this Bill of Complaint, would be inequitable and result in an unjust enrichment of the State of California at the expense of her co-defendants and of Arizona and of the Treasury of the United States." Ariz. Complaint, Calif. Ex. 7506 for iden. (Tr. 22,760), p. 35.

Arizona's pleadings are incomprehensible if she then construed the Project Act as nullifying equitable apportionment and priority of appropriation. Neither is such a possibility suggested by the Court's opinion.

[10]Flood Control Act of 1944, § 1, 58 Stat. 887, 33 U.S.C. § 701-1 (1958).

[11]Nevada's comments appear in H.R. Doc. No. 136, 81st Cong., 1st Sess. (1949), reproduced as Calif. Ex. 7514-D for iden. (Tr. 22,760). Point 12 of the Nevada comments (*id.* at 99) states: "The proposed allocation of 300,000 acre-feet plus a share of surplus water to Nevada in the Colorado River is of great value to this State. That interest is imperiled by lack of the tri-State compact authorized between Arizona, California, and Nevada. *Without the tri-State compact Nevada must rely upon State laws for the water, and our rights are junior to those of California.*" (Emphasis added.)

145-58), but also *in pari materia* with the other federal statutes dealing with water rights in the arid West. Federal statutes have regularly and without exception recognized state law as governing western water rights.[12] Our construction of the Project Act accords with this pattern of federal legislation.[1] The Master's construction would create one inexplicable exception.

III. THE MASTER MISCONSTRUES AND MISAPPLIES SECTIONS 5 AND 8(b) OF THE PROJECT ACT

We agree with the Master that the Project Act "clearly reserves to the United States broad powers over the water impounded in Lake Mead and delegates this power to the Secretary of the Interior, as agent of the United States" (Rep. 152). This authority is manifested by Project Act provisions in section 1 (authorizing the Secretary to "construct, operate, and maintain" Hoover Dam for the purposes, among others, of improving navigation, river regulation, and the storage and delivery of water (Rep. app. 379)), section 5 (authorizing the Secretary, under such general regulations as he may prescribe, to contract for the storage and the delivery of stored water, and providing that no person shall have or be entitled to have the use of stored water except by such contract (Rep. app. 384-85)), and section 8(b) (subjecting any bi- or tri-state compact

---

[12]The Court in United States v. Fallbrook Pub. Util. Dist., 165 Fed. Supp. 806, 841 & n.1 (S.D. Cal. 1958), cites an "almost unbroken line" of 25 federal statutes in which "Congress has deferred to state laws concerning water." The texts of 36 such statutes are set out in appendix B to our rebuttal brief before the Special Master, dated June 30, 1959.

[1]See United States v. Jefferson Elec. Mfg. Co., 291 U.S. 386, 396 (1934), quoted with approval in United States v. Arizona, 295 U.S. 174, 191 (1935).

among Arizona, California, and Nevada, dividing the benefits, including power, from the use of water, to prior contracts made by the Secretary (Rep. app. 389-90)). Those provisions were designed, as the Master recognizes, for the purpose of permitting the Secretary to construct the dam and reservoir and to administer its functions thereafter.[2] The Master assumes, however, that while this was the "basic purpose," a subsidiary purpose was the interstate allocation of water (Rep. 152-54). We disagree that Congress had any such subsidiary purpose or that any such subsidiary purpose necessarily follows from the basic purpose.

Water delivery contracts were never intended to be substitutes for an interstate compact. Absent an interstate compact, the law of equitable apportionment and priority of appropriation, left undisturbed by the Project Act within the framework of the Colorado River Compact and the Limitation Act, controlled the interstate disposition of waters of the Colorado River and its tributaries.[3]

The purpose of water delivery contracts was to provide the Secretary with effective authority to administer the orderly storage and delivery of water, to obtain revenues as part of the financing of the construction and operation of Hoover Dam and reservoir, and to assist Congress' purpose to protect the upper basin's Compact apportionment.

---

[2]Rep. 183: "The Project Act was concerned primarily with the construction and operation of Hoover Dam, and most of its provisions relate to this basic purpose."

[3]The Master's assumption that, absent interstate compact, waters stored in Lake Mead must be forever wasted or allocated by water delivery contracts rests upon his unsupportable conclusion that Congress abrogated equitable apportionment and priority principles in the "mainstream." Rep. 153, 252.

A. Section 5 of the Project Act Is Not a Source of Authority for the Interstate Allocation of "Mainstream" Waters

The first paragraph of section 5 of the Project Act is the focal point of the Master's inferences that Congress authorized the Secretary to impose a "federal apportionment" on the "mainstream" users. It provides (Rep. app. 384-85):

> "That the Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir [Lake Mead] and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses, and generation of electrical energy and delivery at the switchboard to States, municipal corporations, political subdivisions, and private corporations of electrical energy generated at said dam, upon charges that will provide revenue which, in addition to other revenue accruing under the reclamation law and under this Act, will in his judgment cover all expenses of operation and maintenance incurred by the United States on account of works constructed under this Act and the payments to the United States under subdivision (b) of section 4. Contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to paragraph (a) of section 4 of this Act. *No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made*

as herein stated." (Emphasis and bracketed words added.)

The Master asserts that Congress added the last sentence "to make its intention abundantly clear" that the Project Act is "the source of authority for the allocation and delivery of water to Arizona, California and Nevada from Lake Mead and from the Colorado River below Lake Mead." (Rep. 151.) The Secretary's water delivery contracts must be the basis for the allocation of all "mainstream" water because, using the Master's apothegm, "no contract, no water." (Rep. 153.)

The Master misconstrues the statutory scheme.

1. *The Statutory Scheme of the Project Act*

First, that emphasized sentence from section 5 expressly provides that a water delivery contract is required, not for the use of *all* "mainstream" waters, but only for "water stored as aforesaid."[4] Stored waters are the waters made available for consumptive use by the regulation provided by Hoover Dam.[5] Holders of pre-

---

[4]The first sentence of § 5 authorizes the Secretary to contract "for the storage of water in said reservoir and for the delivery thereof" (Rep. app. 384). Section 1 authorizes the Secretary to construct, operate, and maintain Hoover Dam and Lake Mead, *inter alia*, to provide "for storage and for the delivery of the stored waters" (Rep. app. 379).

[5]See Calif. Ex. 351 (Tr. 9,929), letter dated July 31, 1930, from the Acting Secretary to attorneys for Palo Verde Irrigation District, which construes stored water as water in excess of that which could have been used under prior rights from "unregulated flow" (p. 2); Tr. 10,070-71 (Conkling), defining "stored water," by custom and usage, as "water that has been retained in a reservoir out of its normal occurrences for later use"; Gila Valley Irr. Dist. v. United States, 118 F.2d 507, 508-09 (9th Cir. 1941). The federal Salt River Project, Arizona, gives a clear example of the distinction between rights in stored water and preexisting rights in natural flow transiting through a reservoir. Tr. 2,164-67 (McMullin). *Cf.* Nebraska v. Wyoming, 325 U.S. 589, 631 (1945).

existing rights in natural flow available for consumptive use without Hoover Dam regulation do not need water delivery contracts.[6]

The Court held in Arizona's third suit (*Arizona v. California,* 298 U.S. 558, 570 (1936)):

> "[I]t is evident that the United States, by congressional legislation and by act of its officers which that legislation authorizes, has undertaken, in the asserted exercise of its authority to control navigation, to impound, and control the disposition of, *the surplus water in the river not already appropriated.* The defendant states contend, and Arizona does not deny, that the natural dependable flow of the river is already over-appropriated, and it does not appear that without the storage of the impounded water any substantial amount of water would be available for appropriation."[7] (Emphasis added.)

---

[6]The Master occasionally states that Congress delegated to the Secretary the authority to allocate within his discretion the water "unappropriated" as of June 25, 1929. Rep. 153; see also Rep. 203: "[N]o *new* water right without a contract" (emphasis added). The Master's "contractual allocation scheme," however, divides *all* "mainstream" water available for consumptive use in any year (*e.g.,* Rep. 305-06).

[7]Earlier, the Court noted, based on Arizona's Bill of Complaint, that "3,600,000 acre feet are diverted annually below Lees [*sic*] Ferry from the river and its tributaries other than the Gila." (298 U.S. at 562 n.2.)

This construction accords with the administrative practice. Each of the California water delivery contracts, substantially *in haec verba,* calls for the delivery "from storage available in [Lake Mead] . . . so much water as may be necessary to supply the District a total quantity, *including all other waters diverted for use of the District from the Colorado River*" in the amounts and with the priorities thereafter specified.[8] The Secretary's contracts with Arizona projects, executed pursuant to the 1944 contract with the state,[9] contain substantially identical provisions,[10] as does Nevada's 1944

---

[8]Palo Verde Irrigation District contract art. (6) (Rep. app. 424); Imperial Irrigation District contract art. 17 (Ariz. Ex. 34 (Tr. 249)); Coachella Valley County Water District contract art. 17 (Ariz. Ex. 36 (Tr. 250)); Metropolitan Water District amended contract art. 6 (Ariz. Ex. 39 (Tr. 252)) [*cf.* first contract of Metropolitan Water District art. 6 (Ariz. Ex. 38 (Tr. 251)) that the United States will deliver a specified quantity, "provided, that such amount is without prejudice to any additional rights which the District may have or acquire in or to the waters of the Colorado River, or to the power of the parties to contract hereafter with reference thereto"]; City of San Diego contract art. 7 (Ariz. Ex. 40 (Tr. 242)), which has been merged with Metropolitan Water District's contract (Ariz. Ex. 41 (Tr. 253)).

[9]Art. 7(*l*) of the Arizona contract provides that deliveries of water thereunder shall be made for use in Arizona to persons or agencies "as may contract therefor with the Secretary, and as may qualify under the Reclamation Law or other federal statutes or to lands of the United States within Arizona." (Rep. app. 403.)

[10]See, *e.g.,* Yuma County Water Users' Ass'n contract art. 12(a): "including all other water diverted for use within the division from the Colorado River *System*" (emphasis added), (Ariz. Ex. 92 (Tr. 357)); Wellton-Mohawk Irr. & Drainage Dist. contract art. 4 (Ariz. Ex. 93 (Tr. 359)); Unit B Irr. & Drainage Dist. contract art. 5, containing the same reference to the Colorado River *system* as Ariz. Ex. 92 quoted *supra* this note (Ariz. Ex. 94 (Tr. 359A)); North Gila Valley Irr. Dist. contract art. 5 (Ariz. Ex. 95 (Tr. 360)); Yuma Mesa Irr. & Drainage Dist. contract art. 4 (Ariz. Ex. 96 (Tr. 361)); and City of Yuma contract art. 6(a), containing the same reference to the Colorado River *system* as Ariz. Ex. 92 quoted *supra* this note (Calif. Ex. 7611 for iden. (Tr. 22,760)).

contract.[11] The emphasized language recognizes the preexisting natural flow rights of each agency contracting with the Secretary. The Secretary agrees to deliver sufficient stored water to each agency so that the aggregate of the natural flow and stored water diverted for the use of that agency will equal a specified quantity.[11a]

This construction was established by an administrative determination made by the Secretary of the Interior on July 31, 1930, about one year after the Project Act became effective, during the negotiations for the California water delivery contracts. In response to an inquiry from the Palo Verde Irrigation District's attorneys, the Acting Secretary stated (Calif. Ex. 351 (Tr. 9,929) at 2):

> "If no stored water is required by the Palo Verde Irrigation District, no contract between that district and the United States will be required.

---

[11]Ariz. Ex. 44 (Tr. 254), art. 4 (Rep. app. 420): "including all other waters diverted for use within the State of Nevada from the Colorado River *system*" (emphasis added).

[11a]See Nebraska v. Wyoming, 325 U.S. 589, 631 (1945): "[The Warren Act contracts] do not provide that the United States will furnish water in such amounts as may from time to time be available. The United States agrees to deliver water which will, *with all the water to which the land is entitled by appropriation or otherwise,* aggregate a stated amount." (Emphasis added.) The Court's footnote to this last sentence quotes the following language from one of the contracts: "Thus the contract with the Gering Irrigation District provides: 'The United States will impound, and store water in the Pathfinder Reservoir, or elsewhere and release the same into the North Platte River at such times and in sufficient quantities to deliver, and does hereby agree to deliver at the Wyoming-Nebraska State line for the use of said District an amount of water which will, *with all the water the lands of the District may be entitled to by reason of any appropriations and all water not otherwise appropriated, including drainage and seepage waters developed by the United States,* aggregate a flow of water as follows . . . .' " (325 U.S. 631 n.17; emphasis added.)

Those possessed of prior rights to the unregulated flow of the river will be privileged to continue the enjoyment of those rights without interference by storage in the Boulder Canyon reservoir."

Second, the water delivery contracts aid in the administration of the dam and reservoir because they regulate the delivery of "stored waters." Section 5 does not say that a water delivery contract is the source of a water right. Rather it says that a person without a contract has no right to use "stored waters." The Master relies upon the requirement "no contract, no water" (Rep. 153).[12] This requirement, applicable only

[12]The prohibitory phrasing of the contract requirement is not peculiar to the Project Act. Similar phraseology is employed in other parts of the reclamation law dealing with water delivery contracts. See, *e.g.*, § 46 of the Omnibus Adjustment Act of 1926, 44 Stat. 649, as amended, 43 U.S.C. § 423e (1958):

"No water shall be delivered upon the completion of any new project . . . *until a contract* or contracts . . . *shall have been made* . . . providing for payment . . . of the cost of constructing, operating, and maintaining the works . . . ." (Emphasis added.)

The Reclamation Project Act of 1939, § 9(d), 53 Stat. 1195-96, as amended, 43 U.S.C. § 485h(d) (1958), similarly provides:

"No water may be delivered for irrigation of lands in connection with any new project . . . *until an organization . . . has entered into a repayment contract* with the United States . . . ." (Emphasis added.)

Congress' use of prohibitory language similar to that of § 5 in setting out contract requirements under the basic reclamation laws both before and after the Project Act demonstrates that Congress did not intend in § 5 to carve out a unique exception to the Secretary of the Interior's customary contractual authority under the basic reclamation laws. It is also significant that contracts under both of the acts referred to above were considered by this Court in the two most recent decisions involving the relationship of reclamation contracts and water rights as affected by § 8 of the Reclamation Act of 1902.

The mandate of § 46 of the Omnibus Adjustment Act was in effect in 1935 when the Secretary executed the contract with the Casper-Alcova Irrigation District on the North Platte River which this Court gave detailed consideration in Nebraska v. Wyoming, 325 U.S. 589, 633 (1945). (See Wyo. Ex. 3, contained in the Court's files of Nebraska v. Wyoming, No. 5

to stored water, does not prove who is entitled to a contract. But, even if "stored water" is all water in the river below Hoover Dam, holders of "present perfected rights," at least, are entitled to a contract. (See section 6 of the Project Act, Rep. app. 387.)

A water delivery contract serves the same function as a permit or a license to appropriate water under state law; these administrative devices are used in each western state to regulate and to administer the acquisition of rights to the waters subject to appropriation. No person may appropriate such water except by permit and license. However, the water right is created and preserved by exercising due diligence in putting water to beneficial use, not by a piece of paper, whatever it is called—permit, license, or contract.[13] Under the recla-

---

Original, October Term 1960.) The Court's application of § 8 to the reclamation contracts involved on the interstate North Platte River is discussed *supra* p. 151 note 9.

Similarly, § 9(d) contracts executed under the Reclamation Project Act of 1939 were at issue recently in Ivanhoe Irr. Dist. v. McCracken, 357 U.S. 275 (1958). The Special Master recognizes that under those decisions "water rights and priorities as between a reclamation project and other users *within the same state* are governed by state law" (emphasis added), citing to that portion of the *Ivanhoe* decision where § 8 is discussed (Rep. 218). While *Ivanhoe* was concerned solely with intrastate matters, the Court's discussion of § 8 does not limit that section to intrastate effect. Indeed, the Court's discussion should be interpreted consistently with the previous decision in Nebraska v. Wyoming, *supra,* where § 8 was expressly applied interstate. See also Wyoming v. Colorado, 259 U.S. 419, 463-71 (1922).

[13]In 1929, § 1c of the California Water Commission Act was almost a paraphrase of § 5 of the Project Act. It provided: "No right to appropriate or use water subject to [appropriation] shall be initiated or acquired . . . except upon compliance with the provisions of this act." (CALIF. STATS. 1923, ch. 87, § 1, p. 162.) The California Supreme Court held that the California law in this posture was designed "merely to regulate and administer" the appropriation of water. The permit was "not the right itself." Yuba River Power Co. v. Nevada Irr. Dist., 207 Cal. 521, 525, 526, 279 Pac. 128, 129, 130 (1929).

In Wyoming v. Colorado, this Court recognized that permits to appropriate are not the source of water rights because "the amount of the appropriation turns on what is actually done under the permit." 259 U.S. 419, 489 (1922).

mation act, to which the Project Act is expressly made a supplement (sections 12 and 14 (Rep. app. 392, 394)), a federal water storage and delivery contract is not a patent or grant of a water right.[14]

Third, the contracts provide charges for the delivery of "stored water" to obtain revenues to pay for the dam.[1] (Project Act sections 4(b) and 5 (Rep. app. 383-84).)

Fourth, the contracts subject all rights acquired in "stored waters" to the Colorado River Compact (Project Act sections 1, 8(a), and 13(b) and (c) (Rep. app. 379, 389, 393)).

2. Legislative History of Section 5

In early 1926, Secretary of the Interior Work submitted the department's views on the third Swing-Johnson bill to the Senate and House committees considering those measures.[2] At that time the bill contained no language authorizing the Secretary to execute water delivery contracts for the use of the stored water to be made available by the proposed dam.[3] Secretary Work recommended that the stored water be administered by means of water delivery contracts under the reclamation laws:[4]

"The water so impounded should be sold to cities

[4]*Id.* at 6.

requiring it for domestic purposes and other municipal uses and to irrigation districts, like that of the Imperial Valley, desiring a complete or supplemental water supply under the provisions of the Warren Act, payment to be made for a definite volume of water each year.

". . . .

"In the sale of water to irrigation districts and municipalities the provisions of the reclamation act and of the Warren Act would apply.

"Such an adjustment of burdens and benefits should stimulate irrigation development because of the generous terms on which water will be supplied and at the same time result in a considerable revenue from the water furnished for irrigation, domestic, and industrial uses."

Secretary Work's recommendation that the stored water should be administered under customary reclamation contracts in order to recoup project costs (the traditional function of water delivery contracts under the reclamation laws) resulted in the addition to H.R. 6251 of the section 5 language authorizing the Secretary to make contracts to provide revenue to cover construction, operation, and maintenance costs of the project.[5] Subsequently, at the insistence of upper basin representatives, the committee added the last sentence of the first paragraph of section 5 so as to *require* contracts for the use of stored water. (See pp. 177-80 *infra.*)

When the fourth Swing-Johnson bill was introduced

[5]See committee print of H.R. 6251, *id.* at 10-14, described by Representative Swing as substantially conforming to Secretary Work's recommendations. *Id.* at 9-10.

in December 1927, then containing the language added at upper basin insistence to the first paragraph of section 5,[6] Secretary Work submitted a further report on this bill. In his report of January 4, 1928, to Chairman Smith of the House committee, he reasserted that stored water should be sold for domestic, municipal, and irrigation purposes "under the provisions of the Warren Act."[7]

In his report of January 21, 1928, to Chairman Phipps of the Senate committee, Secretary Work similarly reaffirmed that "water will be sold under the provisions of the reclamation law either for a complete or supplemental water supply."[8]

Congress clearly must have shared the view that contracts authorized by section 5 would be patterned after ordinary reclamation contracts. The Secretary's reports, which were printed in the committee hearings[9] and reported to the Senate and House by the respective committees,[1] were not disputed on this point.

The legislative history of the last sentence of the first paragraph of section 5 (which the Master never mentions) is conclusive. It was not the Secretary of the Interior or any other representative of the United States, or any representative of any lower basin state who proposed to add that sentence (repeated for con-

[2]"No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract as herein stated."

[3]Calif. Ex. 1801 (Tr. 12,234) (committee print of the third Swing-Johnson bill showing source of proposed amendments), pp. 1, 7.

[4]By 1926, it had become apparent that Arizona probably would not ratify the Colorado River Compact, and upper basin representatives joined together to prepare a series of amendments to the proposed Swing-Johnson bill which would provide the maximum possible protection for the upper basin's apportionment against a nonratifying Arizona. These proposed amendments were presented to the House committee through Mr. Carpenter (Colorado's Compact negotiator), who acted as the authoritative spokesman for the upper basin interest, with the admonition that "we" must oppose this bill unless these amendments are adopted. *Hearings on H.R. 6251 and H.R. 9826 Before the House Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. 82, 120 (1926).

[5]*Hearings on H.R. 6251 and H.R. 9826 Before the House Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. 161, 163 (1926) (reproduced as Calif. Ex. 1802 (Tr. 12,236)).

[6](Footnote ours.) The last sentence of the first paragraph of § 5 of the Project Act.

stream which has been discharged from the reservoir and is being carried in the stream bed, as a natural conduit, for delivery to lower users, this law would be brought into effect and he would be prevented from using any of that water independent of the Colorado River compact but unincumbered by any other condition for the benefit of California and Nevada. In other words, the compact does not disturb the rights between Arizona, California, and Nevada, *inter sese,* as to their portion of the water.

". . . .

"The thought of this amendment is that any water stored in this reservoir under the terms of the compact, when released from storage shall be burdened by the compact wherever it goes. As far as water is concerned, existing claims of the lower States[7] are protected by the compact. Water must pass through this reservoir to take care of the present existing lower claims.

"As to future development from the main river, we insist that water stored in this structure by the United States be stored and released upon the express condition that the persons who receive the water shall respect and do so under the compact. *It has nothing to do with the interstate relations between Arizona and California."* (Emphasis added.)[8]

---

[7](Footnote ours.) As to the "existing claims of the lower States," see discussion *supra* pp. 169-73 re rights in natural flow.

[8]If there could be any doubt about what Mr. Carpenter intended by this language, it is dispelled by his strongly held and unalterable view, expressed to the same committee during these hearings, that the federal government could not and should

"Mr. Swing. And also they shall make a fair contribution to the burden of returning this money to the Treasury of the United States.

"Mr. Carpenter. Yes; that goes without saying. Anybody benefiting from this reservoir should help pay."

The same views were expressed by Mr. Swing, the House author of the bill.[9]

At the same time the last sentence was added to the first paragraph of section 5, correlative provisions in sections 1, 8(a), and 13(b) and (c) were also added to the Project Act at the insistence of the upper basin representatives for the same purpose, namely, to subject appropriators, the United States, and all claiming under it to the Colorado River Compact.[1] Section 8(a) expressly requires that "contractees" shall "observe and be subject to and controlled by" the Colorado River Compact in the operation of the reservoir and the storage and delivery of water therefrom, "anything in this Act to the contrary notwithstanding, and all . . . contracts shall so provide." The manifest purpose of these provisions is to protect the upper basin's Compact ap-

---

not be permitted to impose any federal apportionment. *Hearings on H.R. 6251 and H.R. 9826, supra* p. 178 note 4, at 148-55. Mr. Carpenter's views on this subject were shared by all members of Congress who had anything to do with the Project Act (*infra* pp. 181-83, 186).

[9]*Hearings on H.R. 9826 Before the House Committee on Rules,* 69th Cong., 2d Sess. 116 (1927); *Hearings on H.R. 5773 Before the House Committee on Irrigation and Reclamation,* 70th Cong., 1st Sess. 57 (1928) (reproduced in Calif. Ex. 1804 (Tr. 12,237), at 3-4).

portionment by impressing the provisions of the Compact upon every contract.[2]

Delph Carpenter's statement that section 5 "has nothing to do with the interstate relations between Arizona and California" reflects one of the major areas of legislative agreement expressed throughout the legislative history of the four Swing-Johnson bills (the last of which culminated in the Project Act) by proponents and opponents of the measure alike: Congress could not make an interstate allocation of the waters of the Colorado River system, because interstate compact or litigation in this Court were the only two ways in which an interstate allocation could be accomplished. A list of representative citations is set forth in the margin.[3]

In January 1928, the Secretary of the Interior submitted to the Senate and the House Committees on Irrigation and Reclamation the report of Hon. James R. Garfield, former Secretary of the Interior; Prof. William F. Durand, Stanford University; Hon. James G. Scrugham, former Governor of Nevada [and Nevada's Compact Commissioner]; and Hon. Frank C. Emerson, Governor of Wyoming [and Wyoming's Compact Commissioner]; they were special advisers to the Secretary of the Interior on the Colorado River basin project. One of the questions propounded by the Secretary to his special advisers was:

"Whether the Federal Government has power to allocate the unappropriated waters of the Colorado River to the basin States, thus rendering a compact between the States unnecessary." *Hearings on S. 728 and S. 1274 Before the Senate Committee on Irrigation and Reclamation*, 70th Cong., 1st Sess. 363 (1928); *Hearings on H.R. 5773 Before the House Committee on Irrigation and Reclamation*, 70th Cong., 1st Sess. 469 (1928).

The answer submitted in the report of Mr. Emerson is typical of the advisers' opinions:

Senator Bratton, upon whom the Master relies in his construction of the California limitation,[4] stated the current and universally held view of Congress in 1928 during the final Senate debates on the Project Act (70 CONG. REC. 330-31 (1928)):

> "There are only two ways known to me through which title to water of an interstate stream, either for purposes of irrigation or development of power, may be adjudicated. One is by a compact or agreement—the method sought to be followed in this case—and the other is by a decree rendered in a suit instituted originally in the Supreme Court of the United States."

3. *Senators Quoted by the Special Master*

The Master wholly ignores the foregoing legislative history of section 5 and the repeated statements by all who took part in the consideration of the Swing-Johnson bills that Congress had no power to allocate the waters of an interstate stream. In contrast to this authoritative, unassailable legislative history, the Master relies primarily upon some excerpts from the remarks of Senators Pittman, Hayden, Walsh, and Johnson.

"Answer. No; except by determination of the Supreme Court of the United States in litigation properly presented. While the Federal Government would have the right to fully regulate, if necessary, the water of the Colorado River for interstate and foreign commerce, the right does not rest in the Government to allocate the water of the river between the States except as such allocation might be in aid of navigation. Each State is sovereign over that portion of the Colorado River contained within its boundaries and the allocation of water between the States themselves can only be accomplished by compact between them with the approval of the United States."

Senate hearings, *supra*, at 365; House hearings, *supra*, at 525.

[4]Rep. 175 n.34: "In 1933 Senator Bratton was appointed to the Court of Appeals for the Tenth Circuit and, in 1953, he became Chief Judge."

during the final debates on the fourth Swing-Johnson bill (Rep. 154-58). Those remarks, when placed in the context in which they were spoken, do not sustain the Master's position.

a. Senator Hayden

Senator Hayden, upon whom the Master relies, was the most vigorous opponent of the Project Act in Congress; he fought every Swing-Johnson bill and he voted against the fourth Swing-Johnson bill,[5] the only such bill to come to a vote. He repeatedly denied that Congress had any power to allocate the waters of the Colorado River.[6] The Special Master's implication to the contrary[7] is based on a statement of Senator Hayden taken completely out of context. The Master quotes (Rep. 155) the following statement of Senator Hayden (70 CONG. REC. 169 (1928)):

> "The only thing required in this bill is contained in *the amendment that I have offered,* that there shall be apportioned to each State its share of the water. Then, who shall obtain that water in rela-

---

[5] 70 CONG. REC. 603 (1928).

[6] *E.g., Hearings on H.R. 9826 Before the House Committee on Rules,* 69th Cong., 2d Sess. 75-76 (1927); 70 CONG. REC. 70 (1928). See also *Hearings on H.R. 12902 Before the Subcommittee of the Senate Committee on Appropriations,* 71st Cong., 2d Sess. 170-72 (1930) (reproduced as Calif. Ex. 1808 (Tr. 12,240)).

[7] Rep. 155: "Senator Hayden of Arizona who, like Senator Pittman, was one of those most interested in the Project Act, emphasized a number of times that the bill provided a basis for the apportionment of water among Arizona, California and Nevada regardless of state law and interstate priorities, but that it would not affect intrastate water rights." Senator Hayden voted against the bill, 70 CONG. REC. 603 (1928).

tive order of priority may be determined by the State courts."[8] (Emphasis added.)

The amendment referred to by Senator Hayden is described by the Master as "the basis for a substitute amendment by Senator Phipps of Colorado which, in turn, was enacted as the first paragraph of Section 4(a) of the Project Act" (Rep. 155).

The amendment referred to by Senator Hayden[9] is printed a few pages earlier in the *Congressional Record* at the point where it was offered that same day by the Senator (70 CONG. REC. 162 (1928)). The Master fails to describe that amendment, which was a substitute text to section 4(a). The first paragraph required, as a condition precedent to the effectiveness of the act, that seven states ratify the Compact and that California, in her act of ratification, enact a specified limitation. The second paragraph specified the terms of a *mandatory* tri-state compact among Arizona, California, and Nevada, by which, in effect, California's ratification of the prescribed tri-state compact would also be a condition precedent to the effectiveness of the

---

[8]The Master's footnote 23 to this quotation identifies "similar statements" by Senator Hayden at 70 CONG. REC. 163 (1928), which apparently refers to this statement:

"The State of Arizona is, therefore, interested in the apportionment of the waters of the lower basin. That is what *the amendment which I have offered* proposes to do." (Emphasis added.) The amendment referred to (Calif. Ex. 2011 (Tr. 11,173)) is set forth at 70 CONG. REC. 162. This quotation is also taken out of context, for the reasons stated about the quotation set forth in text, discussed above.

[9]Calif. Ex. 2011 (Tr. 11,173).

Project Act.[10] It was for this reason that Senator Hayden described "the amendment that I have offered" as *requiring* "that there shall be apportioned to each State its share of the water." Senator Hayden stated only that the *mandatory* tri-state compact would make an apportionment. (See *infra* p. 186.)

The Master has seized upon a possible ambiguity (in the debate over the mandatory formula, subsequently abandoned) which Senator Hayden immediately clarified (70 CONG. REC. 169 (1928)):

> "Mr. Hayden. . . . The only thing required in this bill is contained in the amendment that I have offered, that there shall be apportioned to each State its share of the water. Then, who shall obtain that water in relative order of priority may be determined by the State courts.
>
> "Mr. King. If the Senator means by his statement that the Federal Government may go into a stream, whether it be the Colorado River, the Sacramento River, or a river in the State of Montana,

---

[10] *Id.* at 2-4. During the 1930 hearings on the first appropriation bill for Hoover Dam Senator Hayden said: "Congress of the United States does not possess the power to divide the waters of rivers among States. That is a result which could only be accomplished by the States through compacts." He concluded that without a tri-state compact priority of appropriation would control the interstate allocation of interstate waters and that "once having acquired a prior right to its use, no other State can obtain the use of those waters" to be used by the All-American Canal and the aqueduct to the vicinity of Los Angeles. *Hearings on H.R. 12902 Before a Subcommittee of the Senate Committee on Appropriations*, 71st Cong., 2d Sess. 170-71 (1930), quoted in text at 161 *supra*.

On the Senate floor Senator Hayden reported that "constitutional lawyers in this body said that it was impossible for the Congress of the United States to divide the waters of rivers." 72 CONG. REC. 11170 (1930).

and put its powerful hands down upon the stream and say, 'This is mine; I can build a dam there and allocate water to whom I please, regardless of other rights, either suspended, inchoate, or perfected,' I deny the position which the Senator takes.[11]

"Mr. Hayden. *The amendment that I have offered contemplates no such possibility.*" (Emphasis added.)

The Master quotes the ambiguity and omits the clarification.

Furthermore, that amendment was subsequently withdrawn (70 CONG. REC. 382 (1928)), and a new one specifying only the terms of a mandatory tri-state compact was later offered by Senator Hayden (*id.* at 387-88). The new Hayden amendment was not accepted into the bill until the tri-state compact provision was made permissive only, and not mandatory. (70 CONG. REC. 469 (1928); see Rep. 162-63.)

b. Senator Pittman

Senator Pittman, like Senator Hayden, was firmly convinced that Congress did not have the power to allocate the waters of the Colorado River.[1] Senator Pittman's remarks quoted by the Master (Rep. 155)[2]

---

[11] (Footnote ours.) Senator King is the author of § 18 of the Project Act which preserves priority and equitable apportionment principles. See discussion *supra* pp. 146-47.

[1] *E.g.*, 70 CONG. REC. 386, 468 (1928).

[2] 70 CONG. REC. 471 (1928): "Mr. President, this question has been here now for seven years. The seven States have been attempting to reach an agreement. Apparently the Senate of the United States is about to reach an agreement as to what ought to be done. The Senate has already stated exactly what it thinks about the water. That might have been an imposition

are also taken out of context. Senator Pittman was debating with Senator Bratton the advisability of Congress' specifying in the second paragraph of section 4(a) the terms of a tri-state compact to which Congress would consent in advance of state ratification. Senator Bratton objected that the provision operated to hamper and restrict state sovereignty, even after it had been perfected at the suggestion of Senator Pittman to be permissive rather than mandatory. (See 70 CONG. REC. 469-70 (1928).) Senator Pittman made clear that his intent in authorizing the tri-state compact in advance was merely to prevent unnecessary delay in securing later congressional consent to a tri-state agreement (70 CONG. REC. 471-72 (1928)). Senator Johnson accepted the amendment only after receiving Senator Pittman's assurance that it was not "the will or the demand or the request" of Congress (70 CONG. REC. 472 (1928)).

c. Senators Walsh and Johnson

The confused colloquy between Senators Walsh and Johnson (Rep. 156-58) does not, as the Master erroneously states, "[make] clear that Congress intended that the Secretary of the Interior, in the exercise of the discretion vested in him by Section 5, could, by means of water delivery contracts, effectuate an interstate allocation, in default of allocation by the states themselves" (Rep. 156). Senator Walsh inquired whether the Secretary would be required to supply water to the city of Los Angeles because of the city's appropriation

---

on some States. Why do we not leave it to California to say how much water she shall take out of the river or leave it to Arizona to say how much water she shall take out of the river? It is because it happens to become a duty of the United States Senate to settle this matter, and that is the reason."

mentioned earlier by Senator Johnson (70 CONG. REC. 167), and Senator Johnson answered, "I rather think so" (Rep. 156). After the two Senators proceeded at cross-purposes for a while,[3] Senator Walsh asked whether the Secretary could "utterly ignore those appropriations" to which Senator Johnson replied, "Possibly so." Senator Walsh obviously did not feel that his problem had been clarified since he concluded, "That is what I am curious to find out about." (Rep. 158.) It is clear that neither Senator was talking about rights which could have been satisfied from natural flow without Hoover Dam regulation.

Furthermore, at the time of the Walsh-Johnson colloquy, section 18, which expressly preserves priority and equitable apportionment principles (*supra* pp. 145-47) was not yet part of the Swing-Johnson bill. Section 18, which was accepted in the bill by Senator Johnson a week later (70 CONG. REC. 593), resolves all doubts. Senator Johnson had also announced earlier that under Project Act section 14 (then 13), water rights would be acquired and controlled by section 8 of the Reclamation Act which was incorporated in the Project Act by reference (*supra* pp. 148-50).

B. Section 8(b) Does Not Sustain the Master's Interpretation of Section 5

The Special Master suggests that section 8(b) of the Project Act (Rep. app. 389-90) supports his conclusion that Congress empowered the Secretary to impose upon

[3]Senator Walsh was inquiring about the rights of an appropriator as against the Government to the use of stored waters conserved by the dam. Senator Johnson was explaining the Secretary's right and obligation under § 4(b) to contract with financially responsible agencies to underwrite payment for the dam.

Arizona, California, and Nevada a federal apportionment of "mainstream" water by the execution of contracts to store and deliver waters impounded by Lake Mead (Rep. 151). The suggestion is based upon misinterpretations of both section 5 and section 8(b).

Section 8(b) provides that the United States and those claiming under it shall be "subject to and controlled by" the terms of a two- or three-state compact, between or among Arizona, California, and Nevada "for the *equitable division of the benefits, including power,* arising from the use of water accruing to said States" if that agreement were reached by the states and confirmed by Congress before January 1, 1929; the proviso to section 8(b) provides that if such an agreement were reached and confirmed by Congress after January 1, 1929, that compact would be "subject to"[4] prior water and power contracts executed by the Secretary pursuant to section 5.

The Master's conclusion is based on two assumptions: (1) Congress delegated to the Secretary the power to allocate such water by water delivery contracts authorized in section 5, and (2) the compact contemplated by section 8(b) was an interstate compact for the allocation of water. Neither assumption can be sustained.

Section 5, as we have seen, was not a delegation of power to the Secretary to make interstate allocations of water by water delivery contracts; section 8(b) must be read in this context. The very language of section

---

[4] *Cf.* the language of § 8(a) that the United States shall be "subject to *and controlled by*" the Colorado River Compact (emphasis added) and the language in 8(b) preceding the proviso quoted above.

8(b), authorizing a compact between two or among three states for the "equitable division of the benefits, including power, arising from the use of water," is strikingly different from the language of the second paragraph of section 4(a) and section 19 which authorized interstate compacts for the apportionment of water.[5]

The manifest intent of Congress in enacting section 8(b) was to prevent the states, by compact, from distributing "benefits" among themselves in a way which might impair revenue contracts required to pay for the dam and reservoir—principally the power contracts authorized by sections 5(a), (b), and (c) to meet the requirements of section 4(b). California and Nevada wanted Hoover Dam power, Arizona did not. If two states wished allocations of Hoover Dam power, and the third did not, the two might agree upon the division between them. The section 8(b) compact among two or three states would have related to power or the price of water. This is the construction which Secretary of the Interior Wilbur appears to have placed upon section 8(b) in 1930.[6]

---

[5]Thus § 4(a) refers in unmistakable language to a compact apportioning the specified quantity of water "for exclusive beneficial use in perpetuity," and § 19 refers specifically to the "storage, diversion, and use of the waters of said river." See also the language of the act authorizing the negotiation of the Colorado River Compact in which Congress stated that the subject matter was to provide "for an equitable division and apportionment among the States of the water supply of the Colorado River and of the streams tributary thereto . . . ." 42 Stat. 171 (1921) (Ariz. Ex. 6 (Tr. 221)).

[6]This administrative construction is evidenced by an exchange of correspondence between Secretary Wilbur and Governor John C. Phillips of Arizona. On May 9, 1930, Secretary Wilbur wrote a letter to Governor Phillips in which he repeated Arizona's objection to the "Boulder Dam contracts" and in which he replied

If proponents of section 8(b)[7] had attributed to the proviso of that section the interpretation which the Master derives, its legislative history would have been marked by hot debates about the inclusion of this language of section 8(b). In fact, the record on section 8(b) is singularized by relative silence.[8]

C. The Congressional Plan Is Wholly Contrary to That Deduced by the Special Master

The legislative history of the Project Act contradicts the Master's conclusion that Congress intended that act to be the source of authority for allocation of "main-

---

to that published objection. Secretary Wilbur said (Calif. Ex. 1835 (Tr. 12,256)):

"[Arizona interposes] an objection that the Boulder Dam contracts . . . have been concluded by the Secretary prior to the conclusion of negotiations between California and Arizona, which negotiations your Commission thinks might have resulted in a compact covering power questions as well as water. At any rate, I assume that that is why section 8(b) of the Project Act is quoted.

". . . .

". . . . The construction of this great work . . . is necessarily at a standstill until the Secretary signs the required power contracts, for, under the Act, no appropriations could be made before that time. I have now signed such contracts and made it possible for this work to proceed. But before doing so, not only did this Department wait until the states had had an opportunity under section 8(b) to compact on or before January 1, 1929, as the law allows, but I delayed my action until April 28, 1930, or thirteen months, after taking office, in the earnest hope that the states would be able to work out their problems. . . . Nevertheless, I did not accept that failure of the states to come together as being final, nor did I, by proceeding immediately with the power contracts, as I might have done, foreclose them from agreeing on the power question."

The letter also deals with Governor Phillips' objection to the Secretary's price—but not the quantity—of water delivered to Metropolitan.

[7]Section 8(b) was a Nevada proposal. See Calif. Ex. 1801 (Tr. 12,234), at 11-12 (then § 8(d); *Hearings on H.R. 6251 and H.R. 9826, supra* p. 178 note 4, at 183.

[8]See, *e.g.*, *Hearings on H.R. 6251 and H.R. 9826, supra* p. 178 note 4, at 201-05; 69 CONG. REC. 9984 (1928) (House).

stream" water. Contrary to the Master's assertions,[1] the legislative history of the Project Act is almost unintelligible except on the premise that the legislators considered that they could *not* provide, in the Project Act, the authority for the federal allocation of impounded water among the states.

The Project Act must be construed in the light of the power which Congress intended to exercise.[2] Congress' repeated disclaimer of the existence of any power in it to allocate the waters of an interstate stream establishes beyond doubt that Congress did not intend to provide authority for a federal allocation of the waters of the Colorado River system.[3]

Moreover, the Project Act should be construed consistently with the legal atmosphere prevailing during the period in which that act was debated and passed. During that time this Court had made clear that Congress could constitutionally delegate power to an administrator only if adequate standards guiding the administrator were supplied in the statute;[4] such standards are wholly absent from the Project Act as it is interpreted by the Master. Neither the terms of a nonexistent compact under section 8(b) nor the nugatory compact envisioned

---

[1]"The congressional debates are almost unintelligible except on the premise that the legislators considered that they were providing, in the Project Act itself, the authority for the allocation of impounded water among the states." (Rep. 154.) The Master has confused administration of the dam and reservoir with the creation and dispensing of water rights.

[2]*Cf.* Helvering v. Griffiths, 318 U.S. 371 (1943).

[3]It is unnecessary for the purpose of ascertaining Congress' intent in 1928 to reach the constitutional question because Congress very clearly did not purport to exercise that power even if it could have done so.

[4]J. W. Hampton, Jr. & Co. v. United States, 276 U.S. 394 (1928).

by section 4(a), second paragraph, can supply standards to the Secretary; sections 14 and 18 are limited by the Master, incorrectly, to their intrastate effect (Rep. 217-18) and sections 8(a) and 13(b) and (c) are limited, correctly, to interbasin effect. By his construction of these sections, the Master has wholly eliminated standards controlling the Secretary's interstate allocation of water. The delegation to the Secretary would be invalid even under the most generous view taken as to the constitutional limits on legislative delegations of power. The Project Act, as we construe it, preserving equitable apportionment and priority principles, provides adequate standards to guide the Secretary sufficiently to satisfy the constitutional requirements laid down by this Court during that earlier era.[5]

It is entirely unreasonable to infer that Congress intended water allocations by these alternatives:

(1) Interstate compacts, approved by legislatures of the states, and consented to by Congress; or

(2) Secretarial allocations by contracts, not even required to be reported to the states or to Congress, which might be written with (a) individual water users, (b) public or private projects, or (c) with states.

The Master's conclusion is completely refuted by the manner in which Congress exacted the limitation on California's water rights. If the Master were correct about the authority Congress purportedly delegated to the Secretary, Congress would have imposed the limitation on California without the consent of any

---

[5]*E.g.*, Panama Refining Co. v. Ryan, 293 U.S. 388 (1935); A. L. A. Schechter Poultry Corp. v. United States, 295 U.S. 495 (1935).

state simply by directing the Secretary to observe that limitation in his water delivery contracts. Likewise, Congress would have imposed the Colorado River Compact simply and directly upon all Colorado River system waters without ratification by any state. Congress did not do so, and the legislative history does not reveal any serious suggestion by any congressman or by any state that Congress should or could do so. Rather, Congress employed a consensual plan under which the limitation was imposed and the Compact made effective, not solely by Congress, but with the concurrence of six states including California's enactment of the California Limitation Act (*supra* pp. 128-37).

PART FOUR

THE SECRETARY'S WATER DELIVERY CONTRACTS DO NOT ESTABLISH ANY FRACTIONAL "CONTRACTUAL ALLOCATION SCHEME"

The Master concludes (1) that Congress intended to authorize the Secretary to make an interstate allocation of "mainstream" water, and (2) that successive Secretaries of the Interior made that allocation by imposing upon Arizona, California, and Nevada substantially the terms of a tri-state compact which each of those states refused to ratify.[1]

I. THE MASTER'S REASONING REFUTES ITSELF: CALIFORNIA AGENCIES CANNOT BE ASSUMED TO HAVE ACCEPTED A "FEDERAL APPORTIONMENT" MORE ADVERSE TO CALIFORNIA THAN THE TRI-STATE COMPACT THAT CONGRESS REFUSED TO REQUIRE AND THAT CALIFORNIA REFUSED TO RATIFY

The "contractual allocation scheme" (Rep. 233) perceived by the Master allocates to California less water than she would have received if the tri-state compact authorized by the second paragraph of section 4(a) had been ratified: California does not get an apportionment in perpetuity of 4.4 million acre-feet of the first 7.5 million acre-feet of "Article III(a) water."

---

[1]The Master asserts that the Secretary deliberately followed the terms of the tri-state compact authorized in § 4(a) of the Project Act in making the interstate allocation attributed to him by the Master, although no such compact has ever been agreed to. (Rep. 163, 222-24.) If the tri-state compact had been ratified, the Secretary's contracts were required to conform to it by the terms of § 5 (Rep. app. 384-85). In the absence of ratification, there was no such direction (Rep. 162-63).

but merely a fractional interest—44/75 of "mainstream" water;[2] California does not bear one half of the Mexican burden,[3] but 44/75 (58⅔ per cent) of that burden. It is incredible that the California agencies voluntarily entered into water delivery contracts which effectuated an apportionment to them upon terms far less favorable than the terms of the tri-state compact to which they were opposed.[4]

II. THE GENERAL REGULATIONS PROMULGATED BY THE SECRETARY OF THE INTERIOR PURSUANT TO THE PROJECT ACT REFUTE THE INFERENCE THAT THE SECRETARY CREATED ANY "CONTRACTUAL ALLOCATION SCHEME"

If the Secretary of the Interior had intended to create an interstate allocation "scheme" of this importance, one would expect to find at least the major elements of that scheme on paper, in one place, formally promulgated. No such writing exists. The General Regulations written by the Secretary contradict any inference that the Secretary created any "contractual allocation scheme" to apportion "mainstream" waters.

---

[2]The Master assumes that if the tri-state compact authorized by the second paragraph of § 4(a) had been ratified, California would have been granted, on a parity with Arizona and Nevada, her apportionment coextensive with the limitation specified in the first paragraph of § 4(a), even though he denies that the first paragraph of that section can be interpreted as a grant (Rep. 231). The second paragraph of § 4(a) unmistakably specifies the apportionments in perpetuity to Arizona and Nevada (no apportionment was made to any other state) from the first 7.5 million acre-feet of "Article III(a) water" in terms of acre-feet, not in ratios or fractions.

[3]See clause (4) of the second paragraph of § 4(a) (Rep. app. 383).

[4]No one has suggested that the California agencies, during the period 1930-1934 when the contracts were executed, entered into those contracts involuntarily.

Section 5 of the Project Act authorizes the Secretary of the Interior to prescribe general regulations governing the writing of two different kinds of contracts: (1) The first paragraph refers to regulations in respect of contracts for the storage of water in the reservoir and delivery thereof, at such points as may be agreed upon, for irrigation and domestic use; and (2) the third paragraph refers to regulations in respect of contracts for the storage and delivery of water for generation of electrical energy and delivery thereof at the switchboard to stated contractees. Congress carefully distinguished the two categories of contracts and carefully distinguished the kinds of regulations which the Secretary was authorized to prescribe for each. The authorization to promulgate general regulations in respect of the first category is permissive;[5] the second category is mandatory (Rep. app. 385):

> "General and uniform regulations *shall* be prescribed by the said Secretary for the awarding of contracts for the sale and delivery of electrical energy . . . ." (Emphasis added.)

Contracts for the sale and distribution of power make interstate allocations; accordingly, Congress provided specific directions to the Secretary of the Interior relating to the order of preference for power applicants,[6]

---

[5]The first paragraph of § 5 provides that the Secretary "is hereby authorized, under such general regulations as he *may* prescribe, to contract for the storage of water . . . and for the delivery thereof . . . for irrigation and domestic uses . . . ." (Emphasis added. Rep. app. 384.)

[6]Section 5(c) provides, in part (Rep. app. 386) that preference among applicants "for the use of water . . . necessary for the generation and distribution of hydroelectric energy, or for delivery at the switchboard . . . shall be given, first, to a State for the generation or purchase of electric energy for use in the State, and the States of Arizona, California, and Nevada shall be given equal opportunity as such applicants."

and the factors expressly to be taken into account in entering into such contractual allocations.[7]

The Secretary is authorized to allocate power interstate, but only for 50 years, subject to certain rights of renewal on terms fixed by Congress (section 5(a) and (b), Rep. app. 385).

The regulations which the Secretary promulgated reflect exactly the statutory distinction between the Secretary's specific authority to make an interstate allocation of the use of falling water for power generation and his lack of authority to make an interstate allocation of water for consumptive use.

The Secretary promulgated General Regulations governing the storage and delivery of water for consumptive use April 23, 1930,[8] and for the use of water for generation of power two days later.[9]

The power regulations make a detailed allocation among Arizona, Nevada, and the California power contractors, reserving 36 per cent of the energy for Arizona and Nevada, which they may commence to take at any time within 50 years, but which California's contractors must take, or pay for even if not taken,

---

[7]The unlettered paragraph following § 5(c) (Rep. app. 386-87) thus provides that "no application of a State . . . for an allocation of water for power purposes or of electrical energy shall be denied . . . on the ground that the bond issue of such State . . . necessary to enable the applicant to utilize such water and appurtenant works . . . necessary for the generation and distribution of . . . energy . . . has not been authorized or marketed, until after a reasonable time . . . has been given to such applicant to have such bond issue authorized and marketed."

[8]Sp. M. Ex. 4 for iden. (Tr. 255) at A485.

[9]*Id.* at A237.

meanwhile. Metropolitan Water District is allocated 36 per cent of the firm energy to be used only for pumping water through its aqueduct.[1]

But the water regulations, under which Metropolitan Water District was to (and does) receive the water to be pumped through its aqueduct, make no interstate allocation whatever. They are completely silent on the subject.[2]

The only other water regulations which have ever been promulgated under the Project Act were those of Secretary Wilbur, dated February 7, 1933[3] (withdrawn by Secretary Ickes later that same year),[4] authorizing a contract with Arizona. These do not make an interstate allocation. To the contrary, article 10(c) of that proposed contract was authorized by the regulations to provide:[5]

> "[T]his contract is without prejudice to relative claims of priorities as between the State of Arizona and other contractors with the United States,

---

[1] *Ibid.* The power regulations were amended from time to time in 1930 and 1931, but the interstate allocation of power was unaffected.

[2] The water regulations were amended in 1931 to incorporate the Seven-Party Agreement. See Calif. Ex. 1811 (Tr. 12,244), quoted in Sp. M. Ex. 4 for iden. (Tr. 255) at A487. It is significant that this amendment did make one interstate provision, and one only: The Secretary reserved the authority, if he should allow Metropolitan, the City of Los Angeles, and the City and/or County of San Diego to accumulate unused water to its credit in the reservoir, "to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between [those California agencies] . . . and such users resulting therefrom." *Id.* § 6 ("Sec. 8" and "Sec. 9"), at A488-89; see Rep. 102 n.23. He has not done so.

[3] Ariz. Ex. 28 (Tr. 244).

[4] Ariz. Ex. 29 (Tr. 244).

[5] *Supra* note 3, at 276.

and shall not otherwise impair any contract heretofore authorized by said regulations."

Article 10(c) cited the regulation of April 23, 1930, amended September 28, 1931, which incorporates the Seven-Party Agreement pursuant to which the California contracts had been made.[6]

It is clear from section 5 of the act that Congress never intended to authorize the Secretary to make an interstate allocation of "mainstream" water,[7] but even if it were assumed, *arguendo,* that Congress did have that intention, it is nevertheless plain that the water delivery contracts executed by successive Secretaries of the Interior do not create the "contractual allocation scheme" (Rep. 233) deduced by the Master.

III. NONE OF THE ELEMENTS OF THE MASTER'S CONTRACTUAL ALLOCATION SCHEME ARE FOUND IN THE WATER DELIVERY CONTRACTS THEMSELVES

Read severally or together, forward or backward, these contracts do not contain, either expressly or by implication, the ingredients of the "contractual allocation scheme" the Master describes. Moreover, the contracts, as they were written, do not purport to effectuate the apportionment which the Master finds by his construction of section 4(a) of the Project Act.

The Master deduces the "contractual allocation scheme" from the limitation upon California and from two water delivery contracts: one of the two contracts executed with the State of Nevada and one with the

---

[6]*Supra* note 2.
[7]See Part Three *supra* pp. 140-94, especially 168-82.

State of Arizona, striking out, however, certain of the provisions of those contracts, and reading the contracts, as thus redrawn, against section 4(a) of the Project Act as he construes that section (Rep. 222-27). In fact, however, the "mainstream" picture is far more complex: Users in Arizona and California have received "mainstream" waters under a myriad of water delivery contracts and water right applications, founded upon the entire reclamation law; others have received "mainstream" waters without a contract of any kind. (*Infra* plate 3; *supra* pp. 152-58.) Water rights have been founded upon such diverse bases as appropriations (*e.g.*, appendix, pp. A4-5, A10, A13-14, A28-29) and federal reservations (see Rep. 254-66). The Master recognizes that there is no water delivery contract with the State of California; rather, the Secretary contracted with a number of agencies within the state (Rep. 207-08).

These diverse rights and obligations originated over a period of several decades from 1910 to 1960 in unrelated transactions with parties who were strangers to one another. The *ex post facto* rearrangement of all of those rights and obligations into one comprehensive interstate structure based solely on Secretarial contracts executed pursuant to the Project Act is inconsistent, not only with their terms, but with each step which brought them into existence.

A. The Delivery Contracts Do Not Purport To Apportion to Any State the Quantities Specified by the Master

None of the contracts as they were written oblige the Secretary to deliver to any state the quantities (much less the fractions) recited by the Master.

The Arizona contract did not require the Secretary to deliver 2.8 million acre-feet; it required the Secretary

to deliver up to 2.8 million acre-feet, but that figure, under the express terms of the contract, could never have been reached because it is explicitly subject to deductions for certain losses, for uses by Arizona above Lake Mead that diminish the flow into Lake Mead, and for uses in recognition of rights of New Mexico and Utah.[8] The 50 per cent of "excess or surplus" is likewise subject to reduction, not only in favor of Nevada, but also in favor of Utah and New Mexico.[9]

The two Nevada contracts specify that the Secretary will deliver, not .3 million acre-feet, but that quantity of water which together with "all other waters diverted for use within the State of Nevada from the Colorado River system" would equal .3 million acre-feet. No provision is made in the Nevada contract for delivery to her of any water over and above the .3 million acre-foot ceiling.[10]

The Master recognizes that these deductions in the Nevada and Arizona contracts destroy the assumed correlation between the "contractual allocation scheme" and

---

[8]Ariz. contract art. 7(b), (d), and (g); Rep. app. 401, 402. The Master invalidates article 7(d) (Rep. 237-47). In the Central Arizona Project report, the quantity of the deduction required under article 7(g) for uses in New Mexico and Utah was stated, under interpretations then advanced by Arizona, as 130,000 acre-feet annually. Ariz. Ex. 71 (Tr. 310, 3,513, 3,520-21), at 150-51.

[9]Ariz. contract art. 7(b), 7(g), Rep. app. 401, 402.

[10]The first water delivery contract with Nevada was executed March 30, 1942, calling for delivery of "so much water as may be necessary to supply the State a total quantity not to exceed" 100,000 acre-feet per annum. (Nev. contract art. 5(a), Rep. app. 410.) The second Nevada contract, executed in 1944, amended the prior contract by increasing the ceiling from .1 to .3 million acre-feet, including "all other waters diverted for use within the State of Nevada from the Colorado River system." (Nev. contract art. 4, Rep. app. 420, amending art. 5(a) of the 1942 contract.)

the contracts as they were written; he attempts to avoid the difficulty by invalidating some of the offending provisions (Rep. 237, 241, 246-47). We agree with the United States that those provisions are clearly valid.[11]

The California contracts, considered severally or together, do not require the Secretary to deliver to California 4.4 million acre-feet of consumptive use and one half of any excess or surplus waters from the "mainstream." On the contrary, the California contracts provide for the delivery to specified California projects of the aggregate quantity of water sufficient to satisfy 5,362,000 acre-feet of consumptive use annually (see Rep. 208, 222, 223-24); that quantity also includes water sufficient to supply Indians, who neither have nor need contracts (Rep. 312 n.3a), and non-Indians, on the Reservation Division of the Yuma Project in California, who hold only individual water right applications (plate 3 *infra* note 7); it does not include water for the other federal reservations in California.

It is apparent that these contracts as they were written cannot "fix" the "proportions" 4.4, 2.8, and .3 which the Master uses in creating his proposed "contractual allocation scheme," because the Secretary did not fix those quantities in the contracts.

Moreover, as the Master recognizes, the California contracts do not call for the delivery of half of surplus (Rep. 223).[12]

---

[11]See U.S. Exception II.

[12]The Master attempts to avoid this difficulty by implying a reservation of one half of surplus for California from a reservation in Arizona's contract for the benefit of Nevada (Rep. 223). The Master thus attributes to the Secretary of the Interior a bizarre method of making an allocation to California, 14 years after he executed the California contracts.

B. The Circumstances Surrounding the Execution of the Water Delivery Contracts Belie the Existence of a "Contractual Allocation Scheme"

The first water delivery contract executed by the Secretary pursuant to the Project Act was the Secretary's contract with Metropolitan Water District calling for delivery to the district of 1,050,000 acre-feet per annum of beneficial consumptive use. Shortly before the execution of that contract, Secretary of the Interior Wilbur expressly disclaimed any intention to deal with the allocation of lower basin waters,[1] a position continuously maintained by Secretary Wilbur and by subsequent Secretaries of the Interior.[2]

If, despite the Secretary's disclaimer, there was a contractual allocation scheme in existence in 1930, what was it? Was California irrevocably allocated 1,050,000 acre-feet of consumptive use? Was California irrevocably allocated 1.05/7.5 of "mainstream" water exclusive of federal reservations? For whom was the "unallocated" water reserved?

---

[1]See, *e.g.*, Calif. Ex. 7553 for iden. (Tr. 22,760).

[2]See, *e.g.*, Calif. Exs. 7601, 7602, 7604, 7605, 7606, 7607, 7608, 7859, 7509, all for iden. (Tr. 22,760), and Calif. Ex. 1837 (Tr. 12,257), *infra* p. 211 note 5. Upon every opportunity, successive Secretaries of the Interior have disclaimed intention to make any interstate allocations; thus, in 1952, Secretary of the Interior Chapman made clear that no allocation should be inferred from his creating the Master Schedule (the document which translates delivery obligations into actual deliveries of water from Imperial Dam, serving projects in both California and Arizona). In his contract with Imperial Irrigation District, providing for the preparation of that schedule, the Secretary declared: "The preparation and approval of a Master Schedule by the Bureau of Reclamation or the Secretary shall not constitute an administrative determination, finding or recommendation as to the water to which any agency is entitled." (Ariz. Ex. 37 (Tr. 250), at 100.)

In 1933, Secretary Wilbur promulgated regulations (Ariz. Ex. 28 (Tr. 244)) authorizing a water contract with Arizona, which said nothing about excess or surplus. Was this a Secretarial allocation? Secretary Ickes revoked the regulations. (Ariz. Ex. 29 (Tr. 244).) What was the Secretarial allocation then?

By 1934, contracts had been executed with California users recognizing rights in California projects for the delivery of water for 5,362,000 acre-feet of consumptive use annually. The contracts themselves, however, do not add up to 5,362,000 acre-feet. That figure includes the rights of the Yuma Project recognized as entitled to a second California priority, but no contract for the project has ever been written. What Secretarial allocation scheme could then be perceived?

In 1942, when the Secretary executed his first water delivery contract with Nevada calling for delivery of up to 100,000 acre-feet of diversions, did the Secretary forever fix the proportion in which Nevada could share "mainstream" water? In 1944, when the Secretary executed a supplementary water delivery contract with Nevada, allocating no part of the excess or surplus water to Nevada, did the Secretary forever allocate, by reservation, 50 per cent of the surplus waters to Arizona? If so, how did Nevada get back 4 per cent when Arizona's water delivery contract was executed later in that year?

If successive Secretaries of the Interior created the "contractual allocation scheme" attributed to the Secretary by the Master, is it not extraordinary that the existence of that scheme utterly escaped the attention of this

Court in three prior cases and in deciding the joinder motion in this case, of the states of Arizona,[3] Nevada, California, New Mexico, and Utah, of the United States, and of Congress[3a] during more than 30 years of continuous exegesis of the documents upon which this theory rests?

IV. CALIFORNIA'S RIGHTS UNDER THE SECRETARY'S CONTRACTUAL ALLOCATION, IF HE MADE ONE, ARE CONTROLLED BY THE PROPER INTERPRETATION OF THE LIMITATION ACT, TO WHICH THE CONTRACTS ARE NECESSARILY SUBJECT

If it were assumed that the Secretary of the Interior made an "allocation" to California by the execution of a series of water delivery contracts with public

---

[3]The existence of this scheme surely eluded Arizona when in January 1944 she filed a statement with the Secretary of the Interior in support of her (then proposed) water delivery contract, stating: "Arizona does not view this contract as a substitute for the Tri-State Compact between Arizona, California and Nevada, authorized in the Boulder Canyon Project Act." Calif. Ex. 7511 for iden. (Tr. 22,760) at 29.

[3a]See, *e.g., Hearings on H.R. 5434 Before the Committee on Irrigation and Reclamation,* 79th Cong., 2d Sess. (1946), Calif. Ex. 7760 for iden. In those hearings on reauthorization for the Gila Project, Charles A. Carson, representing Arizona, made very clear that Arizona did not interpret her water delivery contract as an allocation to Arizona of 2.8 million acre-feet of "mainstream" water. Mr. Carson told the committee:

"We have been talking also of the 2,800,000 acre-feet of water to be delivered to Arizona by this contract. That is not the exact amount; it is subject to reductions by virtue of the use in those portions of Utah and New Mexico which are in the lower basin, and by some other matters . . . ." (*Id.* at 402.)

Among the "other matters" which constituted deductions from that 2,800,000 acre-foot delivery obligation were Arizona's uses on the Gila River system (*id.* at 422, 433). Arizona's then position was that uses on the Gila up to 1,000,000 acre-feet were identified with Article III(b) of the Colorado River Compact; uses on the Gila in excess of 1,000,000 acre-feet were deductions from the 2,800,000 acre-feet deliverable from the main stream (*id.* at 421, 422, 443, 444, 519).

agencies in this state, the Secretary must have intended to allocate to California as much water as she could use within the limitation imposed by the first paragraph of section 4(a) of the Project Act and the reciprocal California Limitation Act (see Rep. 313). If that "allocation" were made, it was made consistently with the construction universally (until 1960) attributed to the limitation. The definitions of the Colorado River Compact are incorporated in the limitation. As we have seen (Part Two *supra* pp. 69-137), that limitation permits a consumptive use in California of (1) 4,400,000 acre-feet per annum whenever the total consumptive use from the Colorado River system (main stream and tributaries) in the lower basin is 7,500,000 acre-feet per annum, and (2) one half of the total consumptive use of such waters in excess of 7,500,000 acre-feet per annum, not to exceed 962,000 acre-feet per annum.

The Secretary must have recognized what every member of Congress who addressed himself to the problem had recognized from the first moment that the possibility of a self-limitation on California was suggested in the United States Senate: California's right would be practically coextensive with California's limitation. This arises from the great geographical fact of life, that California's lands can be served by gravity canals, whereas large expansion of irrigation use in Arizona requires 1,000-foot pump lifts comparable to the proposed Central Arizona Project, or great tunnels through mountain ranges. Only large domestic and industrial water projects can be made self-financing for out-of-basin use, and the only such project is one for southern California population centers.

This is what the Secretary did: On November 5, 1930, the Secretary requested from the State of California and its Colorado River water users a recommendation as to the division of Colorado River waters in California.[4] Pursuant to this request, on August 18, 1931, the defendant public agencies of the state entered into the Seven-Party Agreement[5] which the Division of Water Resources of the State of California recommended to the Secretary as a uniform schedule of priorities to be included in all water delivery contracts with users in California.[6] On September 28, 1931, the Secretary promulgated amended General Regulations, incorporating in article 6 thereof the recommended schedule of priorities from article I of the Seven-Party Agreement.[7] Thereafter, between 1931-1934, the Secretary entered into water delivery contracts with the California public agencies in accordance with the General Regulations so promulgated and the Seven-Party Agreement. (See Rep. 28; Rep. app. 424-28.) These water delivery contracts, in accordance with the regulations, recognized rights in California to 5,362,000 acre-feet per annum for consumptive use (Rep. 207-08), including the second priority right of the Reservation Division of the Yuma Project which has no contract except individual water right applications executed before and after 1929. (Rep. 212.)

---

[4]Calif. Ex. 1810 (Tr. 12,244), text in Sp. M. Ex. 4 for iden. (Tr. 255), app. 1002, p. A477.

[5]Ariz. Ex. 27 (Tr. 242), the effect of which is tabulated in the appendix, p. A3.

[6]Calif. Ex. 1811 (Tr. 12,244), art. 6, text in Sp. M. Ex. 4 for iden. (Tr. 255), pp. A487-89.

[7]*Ibid.*

Thus, by October 15, 1934, when the last California water delivery contract had been executed,[8] if not earlier,[9] the Secretary—had he been authorized to allocate interstate rights to the consumptive use of "mainstream" water by water delivery contracts—had allocated to California (1) the consumptive use of 4,400,000 acre-feet per annum of "mainstream" water in any year that systemwide consumptive use in the lower basin totaled 7,500,000 acre-feet,[1] and (2) one half of the quantity of consumptive use throughout the system in the lower basin in excess of that 7,500,000 acre-feet per annum, but not to exceed 962,000 acre-feet per annum. That allocation to California is consistent with the provisions of the limitation upon California expressly incorporating the systemwide scope of the Colorado River Compact and, therefore, consistent with the requirement of section 5 of the Project Act that water delivery contracts should "conform to paragraph (a) of section 4 of this Act" (Rep. app. 385).

Section 5 of the Project Act expressly requires that such contracts shall be "for permanent service" (Rep. app. 385; see Rep. 238-40). Therefore, after the Secretary made that "allocation" to California, he could not derogate his own grant by allocating part of the water,

---

[8]Ariz. Ex. 37 (Tr. 250); Rep. 28.

[9]On February 7, 1933, the Secretary promulgated regulations with the copy of a proposed water delivery contract with Arizona appended (Ariz. Ex. 28 (Tr. 244)), but these were withdrawn less than five months later (Ariz. Ex. 29 (Tr. 244)) without any contract having been executed thereunder.

[1]The issue of how shortages are to be borne under a Secretarial allocation if there is less than 7,500,000 acre-feet per annum of consumptive use is treated *infra* pp. 211-31.

committed to California in 1930-1934, to Nevada in 1942 and 1944,[2] and to Arizona in 1944.[3]

The Secretary clearly indicated his intention not to impair prior "allocations" of water to California. The Arizona contract expressly recognizes the rights of the United States and California "to contract for storage and delivery of water from Lake Mead for beneficial consumptive use in California," providing the aggregate of all deliveries and uses in California do not exceed the ceiling upon California's uses imposed by the limitation.[4] Moreover, article 10 of the Arizona contract (Rep. app. 405) provides expressly that all provisions of the contract are without prejudice to contentions of other states and water users, *inter alia,* about "(1) the intent, effect, meaning, and interpretation of said [Colorado River] compact and said [Project] act; (2) what part, if any, of the water used or contracted for by any of them falls within Article III(a) of the Colorado River Compact; (3) what part, if any, is within Article III(b) thereof; (4) what part, if any, is excess or surplus waters unapportioned by said Compact; and (5) what limitations on use, rights of use, and relative priorities exist as to the waters of the Colorado River system." The controversy which the Secretary thus disclaimed intent to resolve was the controversy about what the Colorado River Compact meant; all interested

parties then agreed that the Compact was incorporated into section 4(a) of the Project Act.[5]

V. SHORTAGES IN "ARTICLE III(a) WATERS"* ARE BORNE INTERSTATE UNDER PRIORITY AND EQUITABLE APPORTIONMENT PRINCIPLES; THE CONTRACTS DO NOT PURPORT TO SUBSTITUTE PRORATION

The Special Master concludes that his "contractual allocation scheme . . . requires each state to share the burden of the shortage ratably" (Rep. 233). If there is a "contractual allocation scheme," we deny that it controls this issue, or, if it does, that it adopts any principles other than those of priority and equitable apportionment.

A. Priority and Equitable Apportionment Principles Control the Burden of Bearing Shortages, Interstate, in "Article III(a) Waters"*

If there is a "contractual allocation scheme," it is completely silent on whether priority or proration controls the interstate burden of bearing shortages, with

---

[5]See, *e.g.*, the Secretary of the Interior's announcement on the signing of the Arizona contract: "Bureau [of Reclamation] representatives under my instructions have taken the position through the negotiations [of the Arizona contracts] that any contract proposed should not commit the Department as to any controversial issue regarding the amounts of water available to Arizona, or to any compact state, under the compact and the act." Calif. Ex. 1837 (Tr. 12,257), p. 4. See also Calif. Exs. 7601, 7602, 7604, 7605, 7606, all for iden. (Tr. 22,760), interdepartmental correspondence and memoranda, specifying unmistakably that the "controversial" issue was the dispute over the meaning of the Colorado River Compact provisions which were incorporated into the Project Act. Calif. Ex. 7607 for iden. is a memorandum issued by Secretary of the Interior Ickes, February 9, 1944, reiterating the department's position explicated in Calif. Exs. 7601, 7602, 7604, 7605, 7606, all for iden. (Tr. 22,760).

*"Article III(a) waters" is used for convenience instead of the phrase "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact."

two significant exceptions: (1) the Secretary expressly provided proration of any "excess or surplus waters" (California is limited to one half thereof, up to 962,000 acre-feet per annum; Arizona is "allocated" one half thereof, subject to a reduction of one twenty-fifth (four per cent) for Nevada); (2) the California contracts accord to Metropolitan Water District (including the merged rights of Los Angeles and San Diego) the right "so far as the rights of the [California] allottees . . . are concerned" to accumulate water up to a stated quantity in the reservoir by reason of reducing diversions by the district, subject to two provisions, the second of which is "that the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between said District . . . and such users resulting therefrom."[1] No such arrangement was included in the Arizona contract.[2]

The Master correctly states that "the requirement of permanent service in section 5 seems to have been intended to instruct the Secretary to contract for water deliveries in such a way as to assure users, as far as is physically possible, of a stable supply of water" (Rep. 239). The physical and climatic conditions in the Colo-

---

[1]See Rep. app. 426-27, art. 6, §§ 8-9, of Palo Verde Irrigation District contract, which is included in the Secretary's regulations and in all of the California contracts. (See Rep. 28 n.96.)

[2]See Calif. Ex. 1838 (Tr. 12,261), an opinion by Solicitor Margold of the Department of the Interior (approved by the Assistant Secretary) published in 1934 (54 L.D. 593), which concludes that a similar storage provision in a contemplated Arizona water delivery contract "is violative of the Boulder Canyon Project Act and the Colorado River Compact, and that the Secretary is without authority to approve its inclusion in the contract" (p. 6).

rado River basin compel this conclusion (Rep. 238-39). These are the very factors which engendered and spread the appropriation doctrine throughout the arid West (Part One *supra* pp. 54-64). The same considerations must have motivated the Secretary of the Interior in administering a body of law of which the Project Act is one "supplement," and in which the dominant statutory direction since 1902 had been that "beneficial use shall be the basis, the measure, and the limit of the right."[3]

The only proper inference is that the Secretary did not intend to modify the existing law (principles of priority and equitable apportionment) to control the interstate burden of any shortages except when his contracts expressly so provided.[4] Thus, under the "contractual allocation scheme," the burdens of any shortages in the "Article III(a) waters" are borne under those settled principles of western water law.

Finally, it should be noted that priority principles can readily be made a part of any "contractual allocation scheme." This is demonstrated by the Master's scheme in which "priority of 'present perfected rights' regard-

---

[3]Section 8 of the Reclamation Act of 1902, 32 Stat. 390, 43 U.S.C. §§ 372, 383 (1958), discussed *supra* pp. 62-66, 150-52.

[4]The Master applies the correct principle of construction in construing that part of article 7(d) of the Arizona contract providing for reduction of the delivery obligation for evaporation, reservoir and river losses, stating: "As I construe this provision, questions of allocation of losses are expressly left undetermined by the contract; such determination is to be made on the basis of the Compact and Project Act, without reference to other terms of the contract" (Rep. 206). We would apply the same principle to allocation of shortages, adding that the determination is to be made by reference to principles of appropriation, the existing law.

less of state lines" controls the allocation of water "in the extremely improbable event that releases [from Lake Mead] do not satisfy the rights perfected in any of the states [of Arizona, California, and Nevada] as of the effective date of the Act" (Rep. 312).

There are a number of alternative procedures available to the Court to make the requisite determinations of whatever interstate priorities are recognized by this Court which would not unduly delay or complicate the resolution of this controversy:

(1) The Court may adopt the machinery proposed by the Special Master for determination of "present perfected rights." The Master's proposed decree establishes the machinery to determine "present perfected rights" in Arizona, California, and Nevada (Decree art. VI (Rep. 359)) under the decision proposed by the Special Master (Decree art. II(B)(5) and (6) (Rep. 348-49)). This same machinery can be retained and expanded, if necessary, to determine the relevant priorities.

(2) The Court may refer the matter to a Special Master to make those determinations from the record with authority to supplement the record as may be necessary or desirable and report his findings and conclusions to the Court.

(3) The Court may make those determinations from the record. (See *infra* tables 1, 2, and 3.)

B. The Master's Conclusion That Shortages in "Article III(a) Waters" Are Borne Pro Rata Is Based Upon Inferences Improperly Drawn From Erroneous Constructions of the Controlling Documents

The Master's conclusion that shortages in "Article III(a) waters" from the "mainstream" are borne pro rata according to the "contractual allocation scheme" is reached solely upon the basis of a series of inferences improperly drawn from erroneous interpretations of the Colorado River Compact, the Boulder Canyon Project Act, and the water delivery contracts.[5] The Master does not find any express provision to that effect in any of these documents, and there are none. These documents neither abolish priorities nor authorize the creation of an antithetical federal system of water rights. The Master's conclusion to the contrary is based upon erroneous inferences drawn from the following six assumed factors (Rep. 232-37):

1. Proration of "excess or surplus" by the "contractual allocation scheme."

---

[5]Even the Master's scheme must permit the operation of priority principles to a limited extent beyond "present perfected rights." The Master provides (correctly) that water apportioned to but unused in one state may be released for consumptive use in other states (Rep. 314, Decree art. II(B)(8) (Rep. 349-50)). For example, what law other than priority and equitable apportionment is to control competing claims of Arizona and California to water apportioned to, but unused in, Nevada? The contracts do not even purport to deal with these waters.

The Master also resorts, by necessity, to the priority principle when he says that California is entitled by contract to "4.4 million acre-feet of the *first* 7.5 million acre-feet of consumptive use of water from the mainstream in one year." (Rep. 222. Emphasis added.) He refers, of course, to the first 7.5 million acre-feet, the rights to which are prior to any rights in "excess or surplus," and not to the chronologically first 7.5 million acre-feet used after January 1 of each year. The Master demonstrates that even if there were no principle of priority, it would be necessary to create one.

2. "Present perfected rights" provision in section 6 of the Project Act.

3. Approval of the Colorado River Compact by the Project Act.

4. The tri-state compact set forth in the second paragraph of section 4(a) of the Project Act.

5. The principle of "sovereign parity."

6. Administrative construction.

In each instance the Master misconstrues the documents involved, and he draws the wrong inferences from them.

1. *Proration of "Excess or Surplus" by the "Contractual Allocation Scheme"*

In support of his argument for parity in the "Article III(a) waters," the Master relies upon the proration of "excess or surplus" required by his contractual allocation. The Master says that there is nothing in the Project Act, with the exception of the "present perfected rights" provision in section 6,[6] or in the water delivery contracts, "which suggests that a similar parity as between the states does not prevail if there is less than 7.5 million acre-feet of consumptive use to be apportioned among them." (Rep. 234.)

The Project Act does not establish parity since it merely requires California's rights in "excess or surplus" to be *limited* to one half; it is not a source of right. (Rep. 231.) Suppose there were 2 million acre-feet of surplus, and Arizona had prior appropriations therein of 1.5 million acre-feet. The limitation would not be operative, and Arizona would receive 1.5 million acre-feet; priority would rule both sides of the river. The "excess

[6]We deal with the Master's treatment of this provision *infra* pp. 217-21.

or surplus" limitation on California has the *effect* of proration only because it happens that California's rights in "excess or surplus" would, but for the limitation, exceed one half thereof. The words of the limitation are *"not more than* one-half of any excess or surplus waters." (Emphasis added.)

But if there were a "contractual allocation scheme" which requires proration of "excess or surplus," the contrasting silence in the statute and all its legislative history about how shortages in the "Article III(a) waters" would be borne permits only the inference that proration was not intended therein and that priority under equitable apportionment principles was either left undisturbed or adopted by the Secretary. The Master weighs silence on the wrong side of the scale.

2. *"Present Perfected Rights" Provision in Section 6 of the Project Act*

The Master asserts that section 6 of the Project Act[7] requires the Secretary of the Interior, in event of shortage, to supply "present perfected rights" as against all other rights, and to protect these rights in order of priority. He defines "present perfected rights" as the quantity of water put to use prior to June 25, 1929, and the quantity impliedly reserved by the United States for federal reservations prior to that date (Rep. 306-12). The Master concludes that if Congress had intended priority to otherwise govern interstate rights, Congress would have said so, and that Congress did not say so.

---

[7]Section 6 provides in pertinent part (Rep. app. 387): "That the dam and reservoir provided for by section 1 hereof shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of present perfected rights in pursuance of Article VIII of said Colorado River compact; and third, for power."

(Rep. 234-35.) This is exactly the opposite type of inference which the Master asks the Court to draw from the proration of "excess or surplus" and the silence about bearing shortages in "Article III(a) waters." (*Supra* pp. 216-17.)

The Master overlooks the essential fact that "present perfected rights" are not the creation either of the Colorado River Compact or of section 6 of the Project Act. They are preexisting rights under equitable apportionment and appropriation principles, recognized in both Compact and Project Act.[8]

The Master has converted the shield which Article VIII of the Compact and section 6 of the Project Act intended to create for existing projects and going economies into a sword which he would use for their destruction. The statutory inference he draws from section 6 is contradicted expressly by three provisions:

The first is section 18 of the Project Act which preserves the rights of the states with respect to "the appropriation, control, and use of waters within their borders,

[8]The Master suggests (Rep. 234) that "it is quite possible that a right 'perfected' as of June 25, 1929, and thus protected by section 6 is junior in priority to a right recognized under state law but not 'perfected' as of that date. In such a case, section 6 would reverse the order of state priorities." Nothing in the record suggests this possibility. Only eight projects diverted from the river in 1929: Palo Verde Irrigation District (Rep. 58-59), Imperial Irrigation District (Rep. 53-54), and Yuma Project, Reservation Division (Calif. Finding 3G:103(13), pp. III-46 and 47), all in California, and Colorado River Indian Reservation (Calif. Finding 14B:108, p. XIV-19), the North and South Gila Valley area (Calif. Finding 14E:105, pp. XIV-44 and 45), Yuma Project, Valley Division (Calif. Finding 14C:106, p. XIV-28), Yuma Auxiliary Project (Calif. Finding 14D:104, p. XIV-36), and the City of Yuma (Calif. Findings 14A:101-02, pp. XIV-3 and 4), all in Arizona. No appropriator senior to them, but with a right unperfected in 1929, has perfected a right since then. The projects now using water are identified at Rep. 127-28.

except as modified by the Colorado River compact or other interstate agreement." (Rep. app. 395.) This section, which was the basis of the Court's holding in *Arizona v. California,* 283 U.S. 423 (1931), is discussed *supra* pp. 140-45. The second is section 14 of the Project Act which incorporates section 8 of the Reclamation Act (*supra* pp. 147-50). The third is the language which Congress prescribed for the California Limitation Act. The quantities specified within California's limitation include "all water necessary for the supply of any rights which may now exist." (Rep. app. 398.) This describes recognition, not the destruction, of existing rights.

But even if the Master's construction of the "present perfected rights" provision in section 6 were correct, his conclusion that all other priorities are divested does not follow. The *upper basin* spokesmen put this in section 6.[9] They disclaimed all intent to affect rights of Arizona and California *inter sese.* (*Supra* pp. 177-81.) Even if "present perfected rights" by the mandate of section 6 are senior to all other rights in the "mainstream," described by the Master as "rights that might be recognized . . . under state law but that do not qualify as perfected rights" (Rep. 161), it does not follow that those other rights, *inter sese,* are not governed by priority principles. At the very least, sections 14 and 18 of the Project Act preserve those priorities.

In combination, the Master's narrow definition of "present perfected rights" and his destruction of all interstate priorities other than those of "present perfected rights" would be as detrimental to Arizona, in many

[9] *Hearings on H.R. 6251 and H.R. 9826 Before House Committee on Irrigation and Reclamation,* 69th Cong., 1st Sess. 113, 116, 166-67 (1926).

respects, as to California. If the Master is correct, the city of Yuma was a trespasser on the river until it received a contract in 1960. Most users in the South Gila Valley are trespassers today. (Rep. 53, 213.) Unless the noncontract users in the South Gila Valley secure a contract or go out of existence earlier, Arizona would be in contempt of the Special Master's recommended decree from the moment of its entry by this Court.

Finally, it should be noted that article 7(*l*) of Arizona's 1944 contract expressly provides that "present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this contract" (Rep. app. 403). This contract obviously speaks as of its effective date in 1944.

Arizona's 1944 contract further provides: "No charge shall be made for the storage or delivery of water at diversion points as herein provided necessary to supply present perfected rights in Arizona."[10] Although uses by Arizona main stream projects (except for the Valley Division of the Yuma Project) have expanded over their uses as of June 25, 1929,[1] no Arizona project has

---

[10]Art. 9, Rep. app. 404. The balance of article 9 provides: "A charge of 50¢ per acre-foot shall be made for all water actually diverted directly from Lake Mead during the Boulder Dam cost repayment period, which said charge shall be paid by the users of such water, subject to reduction by the Secretary in the amount of the charge if it is concluded by him at any time during said cost-repayment period that such charge is too high. After expiration of the cost-repayment period, charges shall be on such basis as may hereafter be prescribed by Congress. Charges for the storage or delivery of water diverted at a point or points below Boulder Dam, for users, other than those specified above, shall be as agreed upon between the Secretary and such users at the time of execution of contracts therefor, and shall be paid by such users; provided such charges shall, in no event, exceed 25¢ per acre-foot."

[1]See Ariz. Ex. 77-B (Tr. 3,992), table A-1, p. 43, areas A-7-C, A-8-C, A-9-C; Ariz. Ex. 190 (Tr. 3,686), table 1.

been required to make any payment for the use of main stream water.[2]

The Master's proposal to rewrite the law is based on inference and conjecture, and is not supported by a single word which anyone uttered about the Compact and its treatment of "present perfected rights," or section 6 of the Project Act and its treatment.

3. *Approval of the Colorado River Compact by the Project Act*

The Master points out that the Project Act approved the Colorado River Compact which he says "provides the background for the enactment of the Project Act" (Rep. 235), and the Compact, he asserts, treats the upper and lower basins on a parity with priority of appropriation not an operative factor. The Master relies upon Article III(c) which requires the two basins to bear equally the burden of any deficiency to meet the Mexican Treaty obligation if the waters surplus to the Article III(a) and (b) allocations are insufficient to supply Mexico. *Ibid.*

Article III(c) and (d) makes clear that the Compact does not put the two basins on a parity.[3] Article III(c) requires Mexico to be supplied first from the systemwide surplus over the Article III(a) and (b) allocations. Thus, the rights to the use of III(c) waters

---

[2]Calif. Ex. 2718 is a U.S. Bureau of Reclamation tabulation of revenues received from storage of water (Tr. 17,220, 17,234-35). Only Nevada and Metropolitan Water District have paid for any water delivered.

[3]See Ariz. Exceptions, p. 2 n.1: "[W]e certainly disagree with the Special Master's statement that 'the Compact treats the Upper and Lower Basins on a parity one to the other in regard to the division of water . . .' (Rep. 235)."

are junior to and not on a parity with those specified by Article III(a) and (b).

Article III(d), which provides that the upper division states may not deplete the Lee Ferry flow below 75 million acre-feet in any consecutive ten years, establishes a senior main stream right in favor of the lower basin, and is described by the Master as "the guarantee of the Compact" (Rep. 144). Article III(d) was apparently inserted in the Compact in recognition of the more rapid and substantial development below Lee Ferry. Thus, Article III(d) itself represents an application of the priority principle.

If the express incorporation of the Compact can be read out of section 4(a) and the limitation on California, a faulty inference from the Compact surely cannot be read back in to destroy the priority principle established under western water law for the past century. If the Compact provides any background for enactment of the Project Act, it is a background of a systemwide accounting which is included in Article III(c) as well as in Article III(a).

4. *The Tri-State Compact Set Forth in the Second Paragraph of Section 4(a) of the Project Act*

The Master writes (Rep. 235-36):

> "As I have pointed out, the second paragraph of Section 4(a) gives advance approval to a compact among Arizona, California and Nevada containing an allocation of water which was substantially effectuated by the contractual allocation established by the Secretary. Under this proposed compact, each state's apportionment would be of equal quality, precisely like the inter-basin apportion-

ment in the Colorado River Compact. Surely Congress did not intend that such an interstate compact would give California superior priorities to water because of the earlier dates of her uses."

Mere inspection of the proposed tri-state compact discloses the fallacy. The compact would have allocated 2,800,000 acre-feet to Arizona, 300,000 to Nevada, but would have made no allocation whatever to California or to any other lower basin state. California's rights in all or part of the 4.4 million acre-feet of the III(a) apportionment remaining must be filled in from the first paragraph prescribing the terms of the limitation. Concerning the first paragraph, the Master accurately writes (Rep. 231):

"The first paragraph of Section 4(a) is a limitation on California, not a grant to her, and hence cannot be a source of her rights to water as against the other Lower Basin states."

The source of all of California's rights—described in the first paragraph of section 4(a) as including "all water necessary for the supply of any rights which may now exist"—was the only source of rights which any of the states had prior to the Project Act: appropriation and equitable apportionment. These are rights to which priority universally attaches. There can be no implication of intent to deprive California of priorities by a proposed compact which very conspicuously made no allocation to California "of equal quality" or otherwise.

The Master also errs when he ascribes to the Secretary an intent to effectuate this compact. The proration formula which the Special Master would infer from section 4(a) is expressly negated by clause (4) of the

proposed tri-state compact in the second paragraph of section 4(a). That clause provides in part (Rep. 383):

> "[I]f, as provided in paragraph (c) of Article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin . . . ."

If the tri-state compact had become effective, clause (4) would have required shortages in the "Article III(a) waters" to be borne in the following proportions:

Arizona	50%
California	50%
Nevada	0%

According to the pro rata allocation of the "Article III(a) waters" which the Master finds is suggested in section 4(a), these shortages are met:

Arizona	37%	(28/75)
California	59%	(44/75)
Nevada	4%	(3/75)

The Master's conclusion fails because it puts everybody on the wrong side of the controversy:

Senator Hayden of Arizona, author[4] and advocate[5] of the proposed tri-state compact, included clause (4) which increased Arizona's share of the Mexican Treaty by 13 per cent (50 minus 37).

---

[4]Calif. Ex. 2014 (Tr. 11,173).
[5]*E.g.*, 70 CONG. REC. 459-68 (1928).

Senator Johnson of California opposed the proposed tri-state compact[6] which decreased California's share of the Mexican burden by 9 per cent (59 minus 50) and put it on Arizona.

Senator Pittman of Nevada was, at best, lukewarm toward the proposed tri-state compact[7] which relieved his state of its entire share of any Mexican Treaty burden and put it on Arizona.

Under the rule in Bratton's case suggested by the Special Master—that the New Mexico Senator is conclusively presumed to be on New Mexico's side (Rep. 175)—this could not be so.

The conclusion compelled by clause (4) of the proposed tri-state compact is that priority of appropriation would control unless a proration scheme such as that suggested in clause (4) were adopted.

5. *The Principle of Sovereign Parity*

The Master asserts (Rep. 236):

> "In short, Congress contemplated inequality in the quantities allocated to each of the states, but parity in their rank. Interstate priorities were rejected. The principle of sovereign parity was established."

"Sovereign parity" is an appealing phrase with many echoes in interstate litigation. It has never, however, been applied as the Special Master proposes. The relevant cases indicate what we take to be a basic truism: States, like men, are equal before the law; the Court

---

[6] *E.g., id.* at 466-67.
[7] *E.g., id.* at 469.

has made clear that this does not mean that either states or men are entitled to equal quantities of water. No one has previously suggested that it means equal priorities in unequal quantities of water.

Allocation of the water supply of an interstate stream is made on the basis of "equitable apportionment." A cardinal principle of equitable apportionment is "equality of right." "Equality of right" refers not to an equal division of the water but to the equal level or plane on which all the states stand, in point of power and right, under the constitutional system.[8] The consequence of this principle is the application, between litigant states, of the principles and rules of law which the states apply in common to the determination of water rights within their borders. (See Part One *supra* pp. 64-65.) In the lower Colorado River basin, priority of appropriation is the exclusive basis of water rights in Arizona, Nevada, New Mexico, and Utah, and so far as material to this litigation, in California. (See Rep. 22.)

This principle, which results from the sovereign character of the parties in litigation, also results from the sovereign character of the parties to an agreement—or to a proposed agreement.

---

[8]What was there said [in Kansas v. Colorado, 206 U.S. 46] about 'equality of right' refers, as the opinion shows (p. 97), not to an equal division of the water, but to the equal level or plane on which all the states stand, in point of power and right, under our constitutional system." Wyoming v. Colorado, 259 U.S. 419, 465 (1922). In Wyoming v. Colorado, out of an available supply determined to be 288,000 acre-feet per annum after satisfaction of prior Colorado rights of 22,250 acre-feet, Wyoming received 272,500 acre-feet (94%) on the basis of her priorities. *Id.* at 490, 496.

6. *Administrative Construction*

The Special Master argues that administrative construction of the Project Act disproves the applicability of priority principles to the use of Lake Mead water, for two reasons: (1) The contracts incorporate the pro rata system of apportionment proposed, he asserts, in section 4(a) of the Project Act. (2) The Secretary has never compiled an interstate priority list nor gathered the data necessary to make such a list. (Rep. 236-37.)

The first reason is wrong. The second is irrelevant.

There are only two proration provisions in section 4(a): Not even the Master's contractual allocation scheme incorporates the express proration of the Mexican Treaty burden between Arizona and California as specified in clause (4) of the proposed tri-state compact. The Master does incorporate what he finds to be a proration of "excess or surplus" suggested by section 4(a). From this, we can infer only the intention to preserve and not to modify interstate priorities in "Article III(a) waters." (*Supra* pp. 212-13, 216-18.) There has never been a shortage, or a threatened shortage, of water to meet the consumptive uses from the main stream in the lower basin. (Rep. 161.) Therefore, it has never been necessary, to date, for the Secretary to establish any rule (priority or proration) to govern the distribution of water in case of shortage. Arizona's contract, article 10, disclaims any effect on interstate priorities—odd, if the "scheme" displaced them.

The Secretary has secured an intrastate priority schedule for California[9] because of the California Limi-

[9]Ariz. Ex. 27 (Tr. 242), the Seven-Party Agreement, article I of which is incorporated in General Regulations of the Secretary, Calif. Ex. 1811 (Tr. 12,244), art 6.

tation Act which restricts the quantity of water available to satisfy the very substantial California rights. Thus an intrastate priority conflict arose almost immediately in California. On the other hand, there has been more than sufficient water to supply requirements of other basin states; and, therefore, a shortage within Arizona and Nevada has been unlikely and an intrastate priority schedule has not been made. Yet the Special Master agrees that the intrastate distribution of water in each of these states is governed by intrastate priorities (see Rep. 216-17).

Similarly, the Secretary has never compiled a list of "present perfected rights" and their relative priorities. Yet, the Special Master asserts that the statute expressly commands their satisfaction and the preservation of their priorities. (Rep. 306-12, 349, Decree art. II(B)(6).) The Master's recommended decree provides machinery for the determination of "present perfected rights" and their priorities. (Rep. 359, Decree art. VI.)

We have set forth (pp. 162-65 *supra*) sustained administrative materials which establish that priority principles as incorporated in equitable apportionment have not been nullified by the Project Act or by the contracts.

C. The Master's Proration Scheme Would Provide an Illogical and Impractical Dual System of Water Rights in the Lower Basin

The Master recommends that the use of water from the "mainstream" is to be governed by a proration formula. (Rep. 233-37.) Rights to the use of water

found flowing in any other part of the Colorado River system within the lower basin (including the main stream between Lee Ferry and Lake Mead) are still governed by the doctrine of equitable apportionment. (Rep. 320-21, 323, 325.) Strangely, however, the equitable apportionment doctrine is also found to apply between competing rights on the "mainstream" and rights on the "tributaries." (Rep. 316-17.) The Special Master invalidates the deduction clauses in the Arizona and the Nevada water delivery contracts which are designed to protect the Lake Mead supply against undue depletions of the Lake Mead supply by those states. Instead, the Master suggests (Rep. 247):

> "[V]oiding these provisions does not . . . leave California helpless to protect her interests. . . . California will be able to protect herself against undue depletions on the tributaries and the mainstream above Lake Mead by compact, or, if the necessity arises, by suit."

Suppose that Arizona constructs a Central Arizona Project, diverting water from Bridge or Marble canyons on the newly defined "tributary," the main stream above Lake Mead. (See Rep. 227-28.) California is invited to sue. The suit would be based on equitable apportionment, and the decree would recognize California's priorities. A decree in that suit, if it prevailed, would enjoin the diversion, and water would be released into Lake Mead.

> "Once this tributary water commingles with the mainstream water it is governed by the Project Act and the Secretary's water delivery contracts

and may be consumed only according to the interstate apportionment created by them." (Rep. 317.)

First: The effect thereof is to allocate to California only 44/75 of the water supply which our water right makes available for use. The Master has created an anomalous creature hitherto unknown to water law: a water right which can be fully vindicated against junior users but which is shorn of 31/75 of any water made available thereby.

Second: The Secretary must allocate 28/75 of that water to Arizona users below Hoover Dam. If the rights of Arizona users below Hoover Dam were junior to the rights of the enjoined Arizona users above Lake Mead, this allocation would be a violation of state law which the Master finds prohibited by section 18 of the Project Act (Rep. 240-41) as enforced by a provision in the Master's recommended decree (Rep. 350, Decree art. II(C)(1)). Yet it is partially on the basis of a supposed similar violation of section 18 of the Project Act that the Master voids the deduction clauses in the Arizona and Nevada contracts (Rep. 240-41). Thus, the Master has invalidated, without good reason (see *supra* pp. 201-03) the contract provision designed to protect the Lake Mead supply and has substituted therefor an unworkable scheme of overlapping priority and proration.

Third: The 3/75 of such water would be available to Nevada users from Lake Mead and below even though some of these uses would be junior to the enjoined use. This would be contrary to the very priority under equitable apportionment principles which required the release of these waters.

Such a dual system of water rights is completely unknown in the law of the West. The Master's dual system of water rights *requires* that priority, both interstate and intrastate, be violated.

Neither the Project Act nor any contractual allocation scheme established thereunder can reasonably be construed to impose this illogical and unworkable dual system of water rights on any part of the Colorado River system in the lower basin.

PART FIVE

THE DEPENDABLE WATER SUPPLY CAN AND MUST BE DETERMINED

The Water Supply Issue and Its Significance

The Report generates, but fails to articulate, this paradox:

1. Absent the Colorado River Compact, there could be no justiciable controversy among Arizona, California, and Nevada; indeed, not even a harsh word. The historic flow of the Colorado River at Lee Ferry, the dividing point between the upper and lower basins, as reported by the Master,[1] is in excess of that required to supply all of the demands of Arizona and Nevada for all of the projects now in existence plus all of the demands for new projects which those states have identified, plus a full supply for California's Metropolitan Water District and all California priorities senior to it,[2] plus the Mexican Water Treaty

---

[1]The Master reports historic Lee Ferry flows in three tables, at Rep. 109, 117, and 146. The table at Rep. 109, giving aggregates by decades, 1898-1958, shows that the flow for the most recent 10-year period, ending in 1958, averaged 11.66 million acre-feet per year; 20 years, 11.9 million; 30 years, 11.85 million; 40 years, 12.73 million; 50 years, 13.50 million; and 60 years, 13.66 million.

[2]If California were to receive enough water to give the Metropolitan Water District a full supply, California would receive 5.062 million acre-feet of consumptive use, disregarding minor quantities for federal reservations in California sustained by the Master (*supra p.* 15). Under the Master's formula, in such event, Arizona would receive enough to sustain 3.462 million, and Nevada 300,000, a total of 8.824 million (as between Arizona and Nevada, the apportionment would vary somewhat, depending upon whether the Secretary contracts with Nevada for 4% of surplus, but the total for the two states in any event would be 3.762 million if California received 5.062 million, and the sum total of 8.824 million would be unchanged). This requires a flow at Lee Ferry of about 2,500,000 acre-feet more than the uses sustained (see plate 7 *infra* and accompanying table) or more than 11.3 million acre-feet, to supply Mexican Treaty deliveries and losses.

requirements, and all transit losses projected for the future.[3] If there is now a justiciable controversy in the lower basin, it is only because some present recognition must be given to the Colorado River Compact's apportionment to the upper basin, not yet fully utilized. But the Master says that the Compact apportionment of 7.5 million acre-feet of consumptive use is only a "ceiling on the quantity of water which may be appropriated" (Rep. 140), which may or may not ever be reached[4] (Rep. 111-13), and is irrelevant (Rep. 138). If so, the conclusion ought to follow that the case is not now justiciable. The Master holds otherwise (Rep. 129-35).[5]

2. On the other hand, a comparison of the water supply at Lee Ferry for the last 30, 40, 50, or even 60 years (Rep. 109) with the rate of upper basin depletions which will be occasioned by projects now under construction, plus projects which Congress has authorized or instructed the Secretary of the Interior to prepare for submission to Congress,[6] shows that the residue which will be available after these depletions will not support on a permanent basis the consumptive use of more than 6 million acre-feet per annum of main stream water in Arizona, California, and Nevada after satisfying the first lien of the Mexican Water Treaty

---

[3]Treaty delivery plus net transit losses below Lee Ferry projected by Arizona and California, based on existing and authorized storage capacity, are 2.350 and 2.525 million acre-feet, respectively. See plates 7 and 8 and accompanying table *infra*.

[4]Rep. 115: "Existing California uses are in no danger of curtailment unless and until many vast new projects, some of which are not even contemplated at this time, are approved by Congress and constructed."

[5]Rep. 132-33: "[D]espite a present unsatisfied demand for water in the Lower Basin, it is impossible to develop further uses of the water because of the cloud on its legal availability."

[6]Pp. 252-53 *infra*.

and nature's toll of unavoidable losses.[7] Of this, California's share under the Master's formula would be 3,520,000 acre-feet[8] compared with constructed capacity of 5,362,000 acre-feet, and actual uses at the close of trial of 4,586,392 acre-feet,[1] now substantially greater.[2] The survival of one or more of California's existing projects, if the Special Master's formula is approved, will depend either upon nature's generosity in furnishing a water supply in the next half century greater than that of the last half century, or on Congress' reversal of its stated policy[3] of putting to use in the upper basin the water which the Compact apportions to that basin in perpetuity.

The conclusion ought to follow that the Report's formula for division of the supply among Arizona, California, and Nevada does violence to the meaning of the documents which together constitute the law of the river. The Master declines to so test his formula, saying that (1) the dependable water supply cannot be determined (Rep. 102-25), and (2) he will not receive evidence on the anticipated growth rate of upper basin depletions (Rep. 112 n.41). We respond to these assertions *infra* pp. 251-61.

Manifestly, the Compact is the factor which tips the scales between these opposite conclusions. But the Master holds the Compact to be irrelevant (Rep. 138).

---

[7]The calculation is shown on the explanatory note and table preceding plate 7 and illustrated on plates 7 and 8.

[8]Calculated by the Master at Rep. 311.

[1]Rep. 128, corrected to reflect n.73.

[2]See appendix, pp. A35-36.

[3]Pp. 252-53 *infra*.

I. THE DEPENDABLE WATER SUPPLY MUST BE DETERMINED TO ESTABLISH THE EXISTENCE OF A JUSTICIABLE CONTROVERSY*

This Court has stated the classic test of a justiciable controversy over water rights:

> "[W]here there is not enough water in the river to satisfy the claims asserted against it, the situation is not basically different from that where two or more persons claim the right to the same parcel of land. The present claimants being States we think the clash of interests to be of that character and dignity which makes the controversy a justiciable one under our original jurisdiction." *Nebraska v. Wyoming,* 325 U.S. 589, 610 (1945).

The controversy which the parties brought to this Court, and the controversy which the Court referred to the Special Master, was a controversy created by conflicting claims to the *dependable* water supply. Its precipitating cause, as the Master accurately reports (Rep. 130-31), was the need to determine whether there will be a "dependable water supply" (Rep. 130) for the proposed Central Arizona Project.

This controversy he declines to resolve.

---

*We shall use "justiciable" and "justiciability" to refer both to the constitutional requirement of a case or controversy necessary to invoke the judicial power, and to the requirement in the original jurisdiction that the case must be of serious magnitude, proved by clear and convincing evidence. Cases are cited at Rep. 130, 319-20.

II. THE DEPENDABLE WATER SUPPLY MUST BE DETERMINED TO COMPARE THE RESULT PROPOSED BY THE DECREE WITH THE RESULT INTENDED BY CONGRESS IN 1928

The Master writes (Rep. 101):

> "Obviously the relevant factor in determining Congressional intention is the supply of mainstream water which Congress thought would be available at the time it enacted the Project Act, not the supply which will in fact be available after 1960."

A water supply study—translating flow to consumptive use—is essential to discover the legislative intent and purpose in 1928. One compelling example will illustrate why this is so.

Here is what Senator Hayden ("one of those most interested in the Project Act," Rep. 155) said on December 12, 1928 (70 CONG. REC. 464):

> "The Senator [Shortridge of California] thoroughly understands, I hope, that under the set-up[4] to which the senior Senator from California [Johnson] has so often referred, there will be available at Boulder Dam on the average about nine and one-half million acre-feet of water. There are varying estimates, but they all arrive at about that conclusion.
>
> "The bill itself provides that a million acre-feet

[4] (Footnote ours.) The "set-up" seems to be the fourth Swing-Johnson bill as it was then pending before the Senate, Calif. Ex. 2010 (Tr. 11,173).

may be used in the vicinity of Los Angeles, and some three and one-half million acre-feet through the all-American canal to irrigate the Imperial Valley. Then there is another half million acre-feet which may be used in the vicinity of Yuma and the Paloverde [*sic*] Valley, leaving about 4,000,000 acre-feet of water unused, and which can not go anywhere else except to Mexico, unless the State of Arizona undertakes this very plan of development which the Senator from California seems to indicate is impossible of accomplishment."

The 9,500,000 acre-feet of supply at the site of Hoover Dam, of which Senator Hayden spoke, is very close to the determinations of flow at Hoover Dam by expert witnesses whose testimony the Special Master rejects. Our figure was 9,650,000.[1]

Senator Hayden's arithmetic would allow 5 million acre-feet for California, 4 million for Arizona, Nevada, and Mexico, and 500,000 acre-feet for losses. It is reasonably clear that he was talking about gross diversions, not diversions less returns to the river.[2] But his supply figure is significant, and he said that it

---

[1]Plate 7 and accompanying table:

Inflow to lower basin at Lee Ferry	8,700,000 acre-feet
Net gain, Lee Ferry to Hoover Dam	950,000 acre-feet
Available at Hoover Dam	9,650,000 acre-feet

[2]Senator Hayden treated the 2,800,000 acre-feet which the proposed tri-state compact would have specified for Arizona as gross diversions, equivalent to 1,852,000 acre-feet of consumptive use (diversions less 948,000 acre-feet of return flow usable in

would provide water for the All-American Canal, the Palo Verde Irrigation District, the Yuma area (presumably in California), and a million acre-feet for "the vicinity of Los Angeles." This congressional purpose the Master would frustrate.

This is a compelling reason to reject any proposal to rewrite the statute to deprive "the vicinity of Los Angeles" of a water supply 30 years after Metropolitan has built works to use the waters which Senator Hayden said (overstating the form but not the substance) were provided for Metropolitan in the bill.

This also, we think, refutes the Master's categorical statement that "the estimates of supply in 1928 were uniformly and substantially larger than even the most

---

Mexico). "In other words, if Arizona were given the privilege of diverting 2,800,000 acre-feet of water from the Colorado River at Parker, and applying it to the lands in the lower Gila Valley, the return flow would be sufficient to take care of all the legitimate demands of Mexico." 70 CONG. REC. 463 (1928). "I have specified in the amendment which I have offered that the State of Arizona lays no claim to that return flow. *We do not ask to have any credit for it* after it arrives in the main stream of the Colorado River. It will be surplus and unappropriated waters which Arizona can not use, and that water, and that alone, will be sufficient to supply any demand for water to meet the existing uses in Mexico." *Id.* at 464. (Emphasis added.)

If rewriting a statute based on a confused legislative history were in order, the place to start, in § 4(a) of the Project Act, is its definition of consumptive use. It is not defined at all in the second paragraph, on which the Master relies for his "contractual allocation scheme."

A "contractual allocation scheme" based on 4.4, 2.8, and .3 million acre-feet for the three states, plus one half of excess or surplus for Arizona and California, all in terms of diversions and not consumptive use, would produce a result far more favorable to California than that which the Master has devised. Of California projects, only Palo Verde and the Reservation Division of the Yuma Project have significant return flow. All Arizona main stream projects have substantial return flow, as Senator Hayden indicated.

optimistic estimates made today."[3] (Rep. 101-02.) The failure to present the appropriate data conceals what is, if the Master is correct, one of this century's most astonishing paradoxes.

For six years California fought for and Arizona fought against the Boulder Canyon Project Act. Every Arizona spokesman in Congress opposed it. The act passed, and Arizona came to this Court alleging its unfairness to her (*Arizona v. California,* 283 U.S. 423, 449-50 (1931)). Yet that act generated an "allocation scheme" under which most of the water which the Boulder Canyon Project makes available for use, over and above the natural flow rights satisfied before Hoover Dam was built, goes to Arizona. (*Infra* plate 9.)

If the Master is right, every California man and every Arizona man in Congress was on the wrong side in

---

[3]The most authoritative report relating to water supply before Congress when the Project Act was passed is that of the board of engineers appointed by the Secretary of the Interior with approval of the President, under authority of a joint resolution of May 29, 1928 (45 Stat. 1011), transmitted to Congress by the Secretary on December 3, 1928. That report, after concluding that prior water supply estimates were too optimistic, stated this conclusion: "It is estimated that the present flow [at Black Canyon, site of Hoover Dam] is depleted by water taken for irrigation in the upper basin by approximately 2,750,000 acre-feet, which amount, if added to the above estimated average flow, would increase it to about 15,000,000 acre-feet." An undepleted or virgin flow of 15,000,000 acre-feet at Black Canyon is the equivalent of about 14,000,000 acre-feet at Lee Ferry because the net gain between the two points is almost 1,000,000 acre-feet per annum (*supra* p. 237 note 1). While other estimates, including that reported by Senator Hayden, were higher (pp. 236-37 *supra*), none is as authoritative an answer to the question: What information did Congress have about water supply when it enacted the Boulder Canyon Project Act? The report is Calif. Ex. 202 (Tr. 7,714), found in Sp. M. Ex. 4 for iden. (Tr. 255), WILBUR & ELY, HOOVER DAM DOCUMENTS (H.R. Doc. No. 717, 80th Cong., 2d Sess. A187 (1948)). Quotation is from p. A200.

1928, and the states remained on the wrong side through three suits in this Court.

The paradox is apparent, however, only when the subject matter of the suit—dependable water supply—is recognized as determinable.

III. THE PREMISES UPON WHICH THE MASTER DECIDES THAT DEPENDABLE WATER SUPPLY IS UNDETERMINABLE ARE IN ERROR, BUT IF CORRECT WOULD MAKE THE CONTROVERSY NONJUSTICIABLE

The controversy is not justiciable if the premises of the Special Master are correct. Those premises, all contrary to the premises of the controversy pleaded and tried, may be quickly identified:

(1) The Colorado River Compact is irrelevant to the controversy[4] (Rep. 138). It is merely a "limitation on appropriative rights" in each basin rather than an apportionment in perpetuity[5] (Rep. 140, 149), and there is nothing to show that upper basin depletion will exceed 4.8 million acre-feet (Rep. 111-12).

(2) Any danger of impairment of existing California uses, under the formula allocation devised by

---

[4]Contrast Ariz. Complaint par. XXII, pp. 25-26, and Prayer, pp. 30-31, identifying Compact issues at the heart of the controversy. *Accord,* U.S. Petition of Intervention, par. XXXII, p. 28.

[5]Contrast Ariz. Exception 1, pp. 3-4, disagreeing with this conclusion of the Master.

U.S. Brief in Support of Motion To Intervene, filed Dec. 31, 1952, pp. 28-29:

"Severally, the States of the Upper Basin of the Colorado River have apportioned among themselves the 7,500,000 acre-feet of water annually allotted to that Basin by the Colorado River Compact. Development of that Basin is going forward premised upon that apportionment."

the Master, is nonexistent "unless and until many vast new projects, some of which are not even contemplated at this time, are approved by Congress and constructed."[6] (Rep. 115.)

(3) The "margin of error" within which it is possible to make a useful prediction of future main stream water supply is greater than 1,800,000 acre-feet per year (Rep. 104), a margin greater than the 1,700,000 acre-feet of water alleged by Arizona to be unused and to which she sought to quiet title.[7]

The controversy is justiciable only if the Master's premises are wrong.

IV. THE MASTER OVERSTATES THE DIFFICULTY OF DETERMINING WATER SUPPLY

A. Necessity and Feasibility

The determinations of the dependable supply in this case were closely corroborated by a distinguished group of experts on both sides.[8] Determinations were in close

---

[6]Contrast: "The contending parties assert conflicting claims to the right to use certain quantities of Colorado River System water. These claims are mutually exclusive. As to each quantity of water involved a recognition of the Arizona claim requires a denial of the California claim and vice versa." Ariz. Statement in Support of Motion To File Bill of Complaint, bound with Complaint, p. 3.

[7]"Arizona is not now presently using all of the aforesaid 3,800,000 acre-feet of water to which it is entitled annually. In excess of 1,700,000 acre-feet out of the said 3,800,000 acre-feet is not being presently used and consumed in Arizona . . . ." Ariz. Complaint, par. XVII(b), p. 21.

[8]The hydrologists who testified on this subject were John R. Riter, Chief Development Engineer, U.S. Bureau of Reclamation (former Chief Hydrologist) (Tr. 21,261), Raymond A. Hill, consulting engineer (Tr. 21,726-31), Thomas M. Stetson, con-

agreement. The range of projections is 5.85 to 6.3 million acre-feet[9] (ignoring, as we must, any assumption as to contributions by the upper division under Article III(c) of the Compact in satisfaction of the Mexican burden (Rep. 145)). Experts used standard techniques understood by all hydrologists and used in planning all great projects. They are supported in their projection of the releases from Hoover Dam by a study published by the Bureau of Reclamation in 1960, after the close of the trial.[10] If the Reclamation Bureau's projection is correct, the Master's formula would reduce the Metropolitan Water District's supply to 538,000 acre-feet per annum by 1975.[11]

The Master discards all determinations. He does not make one of his own. It is entirely possible to make this essential determination. The Court has done so itself from far less satisfactory hydrological records.[12] It can do so here. As an alternative, it can refer the problem to the Master with instructions to take the testimony of experts of his or the Court's own choosing in a supplemental reference. See the motion we made to the Master for this purpose. (Appendix, p. A39.)

---

sulting engineer (Tr. 10,471-73), for California; and John R. Erickson, consulting engineer (Tr. 18,002-05), for Arizona. Luna B. Leopold, Chief Hydraulic Engineer, U.S. Geological Survey (Tr. 21,421) testified on the application of laws of probability to stream flows. There is no more distinguished group in their field.

B. What Is Meant by "Dependable Supply" or "Safe Annual Yield"

The dependable supply or safe annual yield is *not* the minimum flow, *not* the "average" flow. It is the "whole universe," the entire body of water found to have existed during a period of time long enough to include drouths as well as floods, regulated to the maximum extent made possible by the use of storage reservoirs to commute the highly variable annual flows into the maximum annual evenly regulated discharge, less unavoidable losses.

C. The Magnitude of the Dependable Supply

1. *Controlling Factors*

The calculation of the safe annual yield or dependable supply available from the main stream for division among Arizona, California, and Nevada involves three questions: (1) How much will be received at Lee Ferry? (2) How much will this supply be augmented by inflow below Lee Ferry? (3) How much of it is unavailable for consumptive use in the United States because of the Mexican Treaty requirements and unavoidable losses? The residue is dependable supply.

There is no real hydrologic issue. The experts agree on all hydrologic factors within a few percentage points. See plates 7 and 8 and accompanying table comparing the expert witnesses' calculations in determining dependable supply.

2. *Techniques of Determining Water Supply*

The techniques employed by the experts testifying for Arizona and California were standard ones, used con-

tinuously by hydrologists in the calculation of the dependable supply which is essential before any large project is constructed.[1]

Essentially, the method is this: Assuming that all of the reservoirs now in existence and authorized[2] had been in existence at the beginning of any selected period of time, it is mathematically possible to calculate how much of the variable flow that occurred during this period could be converted by this storage into an *equal annual release,* and what the uncontrollable excess or "spills" of floods would be. The process is not, as the Master

---

[1]The technique is spelled out in detail in Calif. Findings, part V, which cross-reference the exhibits and testimony. Annexed to this brief are a schematic drawing, plate 7, which illustrates it, and a bar chart, plate 8, which compares the figures arrived at by the experts for each stage of the calculation. See the explanatory note preceding plate 7.

[2]The water supply studies in evidence deducted from the Lee Ferry inflow so much of the upper basin's apportionment as the upper basin can physically use by means of existing and authorized regulatory storage, plus (in some of the studies) assumed additional upper basin storage, while at the same time complying with Article III(d) of the Compact.

[3]Additional storage constructed anywhere in the Colorado River basin will add little, if any, to the usable water supply. There will be no significant gain in regulation by further increasing capacity because increased capacity will be largely offset by a corresponding increase in evaporation. W. B. Langbein, "Water Yield and Reservoir Storage in the United States," U.S. Geological Survey Open File Report, June 1958, pp. 8-9. This is Calif. Ex. 3007 (Tr. 21,469), adopted as the testimony of Dr. Luna B. Leopold, Chief Hydraulic Engineer, U.S.G.S. (Tr. 21,468-69.)

The largest reservoir under construction is Glen Canyon, located on the main stream about 16 miles upstream from Lee Ferry. All storage capacity existing or authorized for construction in the upper basin at the time of trial would provide the equivalent of 25,000,000 acre-feet of storage capacity effective at Lee Ferry. Tr. 11,721-22 (Stetson).

seems to think, one of averaging (Rep. 107-08). It involves a year-by-year analysis of the optimum drawdown and replenishment of each reservoir on the river, in conjunction with one another.[2a] There are several mathematical methods, but all produce about the same results in dealing with the same basic statistics, all gathered and published by federal agencies. Deductions must be made for reservoir losses, transit losses, and water to supply the Mexican Treaty deliveries (including excess arrivals in Mexico because of regulatory problems). The residue is the dependable supply.

3. *Conclusions of the Experts*

The experts were in close agreement as to the permanently dependable supply which will be available to the lower basin. The best that the lower basin could expect, even if the water supply were as abundant as it was during the most favorable period that ended with the date of trial, and even if all reservoirs in both basins were operated with optimum efficiency, would be in the range of 5.85[3] to 6.3 million acre-feet per year.[4]

[2a]The Secretary of the Interior must coordinate all reservoirs in the Colorado River basin controlling the storage and release of water under the command of the Colorado River Storage Project Act § 7, 70 Stat. 109 (1956), 43 U.S.C. § 620f (1958).

[3]Calif. Ex. 2216-A (Tr. 11,825); Tr. 21,836 (Stetson). The Master refers to the "future Lower Basin mainstream supply" as being 6.175 million (Rep. 110). He has overlooked the witness' reduction to 5.85 by a 5% safety factor. Tr. 11,818-19, 12,141-42 (Stetson).

[4]See table accompanying plates 7 and 8. The only study which indicated a dependable supply greater than 6.3 million acre-feet was that of Arizona witness Erickson based on legal assumptions supplied by Arizona counsel, never clearly explained, but the result of which would have required the upper division states to supply an average of 1,280,000 acre-feet per annum at Lee

D. The Master's Rejection of the Experts' Determinations of Dependable Supply

The Master rejects these determinations on two grounds: (1) "Lower Basin supply is affected by Upper Basin uses . . . no one can say with certainty what increase may occur in Upper Basin uses or at what time" (Rep. 110), and (2) "the science of hydrology is not capable of sustaining a prediction accurate enough to shed light on this question" (Rep. 103).

E. The Effect To Be Given the Colorado River Compact

The controlling reason for the Master's conclusion that the lower basin's dependable supply cannot be determined is his revolutionary interpretation of Article III(a) of the Compact. These are the critical words:

> "There is hereby apportioned . . . in perpetuity . . . the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum . . . ."

What effect shall be given to this apportionment in answering the ultimate question which precipitated this suit: Is there a dependable supply for the proposed Central Arizona Project?

Ferry in controlled releases expressly for purposes of the Mexican Treaty (in addition to the Compact Article III(d) requirement). By this device and increasing existing and authorized upper basin effective storage to the equivalent of 35 million acre-feet at Lee Ferry the lower basin supply was inflated to 7.4 million acre-feet, at the expense of the upper basin. See Tr. 18,090-90A, 18,097 (Erickson); Ariz. Ex. 366 (Tr. 18,097). The instructions of Arizona counsel are incorporated in footnotes in Ariz. Ex. 353 (Tr. 18,097). Arizona counsel later disclaimed these assumptions. (Tr. 21,839-42.) The Master rejects any assumption in the studies of "the extent of the delivery obligation imposed on the states of the Upper Division under Article III(c) of the Colorado River Compact." (Rep. 112.)

Three approaches to this problem appear in the record:

(1) Treat the upper basin's apportionment of 7.5 million acre-feet of consumptive use as a present withdrawal of that quantity from the lower basin's dependable supply, giving it somewhat the effect that the Master gives to a "reserved water right" for federal reservations (Rep. 310). This is the approach used in the Secretary's report to Congress on the Central Arizona Project,[1] and in the United States Petition of Intervention in this case,[2] in demonstrating the existence of a justiciable controversy in the lower basin. If applied literally, the residual Lee Ferry flow would be depleted down to approximately the "guarantee of the Compact" (Rep. 144), 75,000,000 acre-feet each 10 years, stated in Article III(d). (See p. 249 *infra.*)

(2) Treat the upper basin apportionment as if now in use, but only up to the quantity which could be made available for upper basin use (i) by the storage reservoirs now in existence or which Congress has authorized for construction, while (ii) honoring the obligation imposed by Article III(d). This was the method which provided the figures 6.5 and 6.8 million acre-feet of upper basin depletions referred to in the Report at page 111.

(3) Treat the upper basin's apportionment as related to a ceiling on appropriations as the Master does (Rep.

---

[1]Ariz. Exs. 70 (Tr. 308) and 71 (Tr. 310, 3,513, 3,520-21), pp. 150-51; cited at Rep. 30-31, 130.

[2]*Supra* p. 240 note 5.

111, 140-42),[3] that is, the upper basin apportionment makes no reservation at all against the lower basin, but the quantity available to the upper basin is the residue left after the lower basin reaches the ceiling on appropriations imposed upon it by Article III(a) and (b), subject, apparently, to two provisos: (i) the III(d) obligation must be honored (Rep. 144), (ii) the III(a) "ceiling" on each basin is otherwise on a parity, so that if there is not water enough to sustain appropriations up to that ceiling in each basin, the two basins must prorate (Rep. 236).

The Master concedes that the Compact has something to do with lower basin water supply (Rep. 138) but rejects the relevance of both Compact and water supply. What he says about the Compact is misleading:

> "With the storage provided by Lake Mead, and barring a drought unprecedented in the recorded history of the River, the Lower Basin has, under the guarantee of the Compact, available for use at Hoover Dam a minimum of 7,500,000 acre-feet of

---

[3]This requires a word of caution. The Report treats Article III(a) as "a ceiling on the quantity of water which may be appropriated" (Rep. 140), as establishing "limits" (Rep. 142), but this cannot mean that the *upper* basin apportionment is equated with a ceiling on *upper* basin appropriations. If that is meant, the apportionment to a basin is not an asset to it, but a liability.

The Master ignores the Colorado River Storage Project Act which treats the Colorado River Compact as an apportionment in perpetuity to the upper basin. See pp. 252-53 *infra*.

water per year, less transit losses between Lee Ferry and the dam, evaporation loss from Lake Mead, and its share of the Mexican treaty obligation." (Rep. 144-45.)

This statement fails to disclose how "7,500,000 acre-feet of water per year" translates to the denominator of the decree, "diversions less returns to the stream." The following tabulation does so on the basis of the only figures in the Report:

"Guarantee under the Compact		7,500,000"
Less:		
Evaporation loss from Lake Mead (average from Rep. 124)	751,000	
Evaporation loss from Lake Mohave (average from Rep. 125)	153,800	
Evaporation loss from Lake Havasu (*ibid.*)	140,200	
Channel loss between Hoover Dam and international boundary (average 1946-1951, Rep. 125)	971,700	
Lower basin share of the Mexican Treaty obligation (unstated, but at least)	750,000	
		2,766,700
Available for decreed allocation		4,733,300

The losses are larger than those associated with 7,-500,000 acre-feet of flow; tributary inflow and regulatory loss to Mexico are not included; channel and reservoir losses are to some extent duplicating. Nevertheless, the figures make obvious that when the Master associates the "margin of error" in determining water supply with the margin between 7,667,700 and 5,850,000 acre-feet of consumptive use for three states from the "mainstream" (Rep. 104) he does so without regard to what he calls "the guarantee of the Compact." (Rep. 144.)

F. Consequences of the Master's Concept of Article III(a) of the Compact as a "Ceiling" on Appropriations Instead of an Apportionment in Perpetuity

1. *The Legal Problem*

The Master's concept of Article III(a) is the reverse of the pleaded positions of all of the parties which were before the Court when it denied California's motion to join the four upper division states as necessary parties. In the absence of those states, this proposed rewriting of the plain language of the Compact is not a dependable foundation for the determination of this lower basin controversy. Those states would argue that the purpose of the Compact, as stated by the Master (Rep. 22-27, 138-41), would be served only by an apportionment in perpetuity to the upper basin; it certainly could not be served at all by a limitation on appropriations in the *upper* basin; and it could not be adequately served by imposing a limitation on *lower* basin appropriations (including the tributaries (Rep. 140-42)) which left no assurances that the residue not so appropriated would suffice for future upper basin use.

If, however, the Master is right, there is no justiciable controversy. The upper basin has not approached its ceiling (Rep. 111), and the lower basin is only now approaching its ceiling. There is now unused upper basin water, not yet appropriated in the upper basin and which perhaps may never be appropriated there, available for the Central Arizona Project to appropriate without impinging on *lower* basin claims of any party.[4]

[4]The vice of the Master's decision even on this assumption is that it places the risk of error in calculating availability of unused upper basin water on existing facilities and existing economies in California. If there is conviction behind any assumption

2. *The Factual Problem if the Compact Is Treated Merely as a "Ceiling" on Appropriations*

Is the Master right in believing that upper basin depletions will not increase above 4.8 million acre-feet per annum (Rep. 112), that there is nothing to indicate that they will expand to "anywhere near 6,500,000 acre-feet"? (Rep. 111.) The issue was not tried.

In the draft report circulated to the parties on May 5, 1960, the Master stated: "I have become convinced that it is impossible to make an estimate of future supply in the Lower Basin within useful limits of accuracy" (p. 103). The difficulties then appeared to be with the engineering evidence. On June 10, 1960, we moved that the Master appoint an expert or experts to assist in making a determination. (See Calif. comments on draft report, pp. 62-63.) He denied our motion. During oral argument in New York City in August 1960, the Master made clear his view which appears in the Report—that the major uncertainty stems from a conviction that "there is nothing to indicate that the Upper Basin depletions, which have never exceeded 2,200,000 acre-feet per annum measured at Lee Ferry, will expand to anywhere near 6,500,000 acre-feet."[5]

---

which makes unused water available, fairness requires that the risk of error inherent in the assumption should be assumed by those who can evaluate the risk of prospective shortage in planning new projects.

[5]The figure 6,500,000 acre-feet is from our evidence. It is our estimate of the quantity which the upper basin can physically utilize with presently constructed and authorized regulatory storage reservoirs consistently with the upper division delivery obligation under Article III(d) of the Colorado River Compact to supply 75,000,000 acre-feet of flow each 10 years. The Master erroneously asserts that "the witnesses assumed this amount of depletion on instruction of counsel" (Rep. 111). See Tr. 11,729-30, 12,138.

The Master denies (Rep. 112) our offer to prove that these depletions will rise to 6.19 million acre-feet by 1990 (Calif. motion to reopen trial to take evidence re upper basin depletion of Colorado River at Lee Ferry, filed August 31, 1960, at appendix, p. A59), wiping out Metropolitan's supply under his formula.

In fact, project plans are in being for enough projects in the upper basin to use far more than its maximum apportionment.[6]

In 1956, Congress enacted the Colorado River Storage Project Act for the purpose declared in section 1 of "making it possible for the states of the Upper Basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively . . . ." 70 Stat. 105 (1956), 43 U.S.C. § 620 (1958). Three of the Storage Project's major reservoirs are nearing completion.[1]

Section 2 of that act (70 Stat. 106 (1956), 43 U.S.C. § 620a) provides that the Secretary shall give a number of named participating reclamation projects "priority to completion," such projects being the first beneficiaries of the water and power made available by the reservoirs authorized by section 1.

---

[6]H.R. Doc. No. 419, 80th Cong., 1st Sess. 3 (July 1947) (second pagination series). Portions of H.R. Doc. No. 419 are Ariz. Ex. 64 (Tr. 290).

[1]*Cf.* Rep. 112. Glen Canyon Dam, Flaming Gorge Dam, and Navajo Dam are scheduled for closure by 1962 and will then commence withholding of water which otherwise would flow to the lower basin.

Section 3 of the act[2] expressly declares that it is not the intention of Congress to limit such comprehensive development as will provide for the consumptive use of all of the water apportioned to the upper basin.

A bill passed the Senate on March 28, 1961, after the Master filed his Report, which will increase upper basin depletions by about 360,000 acre-feet,[3] and others are pending for early action.

G. Hydrologic Factors

With respect to the "science of hydrology" (Rep. 103), the Master's criticisms relate to three topics: (a) general criticisms, (b) the period selected for analysis, and (c) difficulties of reservoir operation. These are discussed briefly below, in the light of a subsequent Bureau of Reclamation report, dated September 1960, which was not available to the Master or ourselves at the time of oral argument.

1. *The Master's General Criticism of the Science of Hydrology*

The Master's general comments on the imperfections of the science of hydrology (Rep. 105-10), if justified,

[2]"It is not the intention of Congress, in authorizing only those projects designated in section 1 of this act [43 U.S.C. § 620], and in authorizing priority in planning only those additional projects designated in section 2 [43 U.S.C. § 620a] of this act, to limit, restrict, or otherwise interfere with such comprehensive development as will provide for the consumptive use by States of the Upper Colorado River Basin of waters, the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, nor to preclude consideration and authorization by the Congress of additional projects under the allocations in the compacts as additional needs are indicated." (70 Stat. 107 (1956), 43 U.S.C. § 620b (1958).)

[3]S. 107, 87th Cong., 1st Sess. (1961), authorizing construction of the San Juan Chama-Navajo Project, New Mexico.

would just about make it impossible to plan any project anywhere. Whatever the merit of the criticisms, the weight to be given to them is in the *reduction,* not the increase, of the experts' projection of the dependable supply.

The Master treats of only two serious problems: selection of the proper climatological period, and the difficulty of operating reservoirs to store water over many years.

2. *Period Selected*

The significance of the selection of the period of 1909-1956 was that this was the *wettest* period ending with the latest year of record then available.[4] If there is no water for new projects based on the water supply of that period, *a fortiori* there is no water available for new projects if any other period ending in 1956 is used. A strong argument can be made for using the 1930-1956 period, which produced an average annual virgin flow some 2,000,000 acre-feet less than that of the 1909-1956 period. In 1945 in *Nebraska v. Wyoming,* 325 U.S. 589, 620-21, this Court said:

> "In recommending his apportionment the Special Master did not rest on the long-time average flow of the river. We have discussed the drought which has persisted in this river basin since 1930. No one knows whether it has run its course or whether it represents a new norm. There is no reliable basis for prediction. But a controversy exists; and the decree which is entered must deal with condi-

[4]See Rep. 118 for a comparison of average undepleted or "virgin" flows for four periods ending in 1956. By "virgin" flow is meant the flow which would have existed in a particular year if there had been no man-made depletions at all above that point. *e.g.,* Lee Ferry.

tions as they obtain today. If they substantially change, the decree can be adjusted to meet the new conditions. But the decree which is fashioned must be based, as the Special Master recognized, on the dependable flow. . . . On this record we cannot say that the dependable flow is greater than the average condition which has prevailed since 1930."[5]

We think the Court may judicially notice from United States Geological Survey records that the "drought" has intensified and continued since 1958,[6] the last year for which the historic flow at Lee Ferry is shown in the Report (Rep. 117). The safe annual yield, if calculated today, would be less than that calculated at the time of trial. A period of drouth, once recorded, sets the upper limit of the dependable supply. No later succession of wet years can erase that limitation. But an extension, or a future succession, of dry years may establish a more severe limitation.

There is never any assurance that the future will repeat the past, but it is utter folly to assume that the

---

[5]Dr. Luna B. Leopold, Chief Hydraulic Engineer, U.S. Geological Survey, testified: "One must consider the nature of the problem that he is faced with in trying to choose whether you are going to pay more attention to the upper rather than to the lower limit" of probabilities of water supply. (Tr. 21,453.) This Court has consistently manifested a keen awareness of the hazards of speculative optimism, suggested by the Master's reaction to Dr. Leopold's testimony: "I might feel differently if I were going to feed a population of birds or differently if I were going to feed a population of humans." (Tr. 21,454.) See also Wyoming v. Colorado, 259 U.S. 419, 475-76 (1922).

[6]Following are the records of historic flows at Lee Ferry released by the Geological Survey for the two years subsequent to those covered by the Master's table at Rep. 117:

Water Year	Acre-Feet	Source
1959	6,756,000	U.S.G.S., WSP No. 1633, at 330
1960	9,200,000	U.S.G.S., Provisional Records

future water supply will be *greater* than that shown by past records. Each time this Court has made a determination of water supply it has done so based on past records. This Court has consistently recognized that water supply must be determined and that it must be determined conservatively. *Nebraska v. Wyoming,* 325 U.S. 589, 620-21 (1945); *Colorado v. Kansas,* 320 U.S. 383, 396-97 (1943); *Washington v. Oregon,* 297 U.S. 517, 520 (1936); *Wyoming v. Colorado,* 259 U.S. 419, 471 (1922). The Boulder Canyon Project was reported to Congress as feasible upon that same hypothesis.[7]

The records available in this case are far better, both in length of record and accuracy,[8] than those which the Court employed in *Nebraska v. Wyoming* and *Wyoming v. Colorado, supra.* (See plates 4, 5, and 6 which graphically compare the length of stream flow record

---

[7]See p. 239 note 3 *supra* (Sibert Board Report), p. A200.

[8]S. Doc. No. 79, 86th Cong., 2d Sess. 69-70 (1960), presents this appraisal by the Federal Power Commission of the historical records:

"A gaging station at Lees Ferry has been maintained by the U.S. Geological Survey (USGS) since the summer of 1921. According to the published USGS Water Supply papers, the recorded flows at Lees Ferry, for the water years 1922 through 1958, are excellent."

As to earlier water years, the same document quotes an appraisal by a USGS engineer:

" 'The stream flow records of Colorado River at Lee's Ferry, Arizona have probably been given more critical examination than those on any other river in the United States, both by the Geological Survey and by other agencies. While the estimated or computed records are not to be considered as good as the gaging station records, the runoff figures published in W.S.P. 1313 for such periods are probably as good as any that can be derived from existing data. It is doubtful that, on an annual basis, any gross errors have been introduced; those errors that are inevitable are undoubtedly of a compensating nature.' " *Id.* at 77-78.

on the Colorado with the records employed in the two earlier cases.) There is no conflict in the evidence in this case with respect to the hydrologic data. All parties used substantially identical data.

3. *The Difficulty of Operating Reservoirs*

The Master says "it is unrealistic to take the average yearly inflow into Lake Mead for a 30- or 50-year period and assume that this, less evaporation losses, will in fact be the actual yearly supply released from Lake Mead" (Rep. 108). Again, "It might be that over a short period of less than ten years Hoover Dam could be operated flexibly enough to translate the total inflow into an average yearly release. But it is most unlikely that it can be done over a longer period" (*id.*).

If this is so, then it becomes important to examine the flow the Master reports for the critical decade 1931-1940.[9] During this period the total historical flow at Lee Ferry was only 101,510,200 acre-feet (Rep. 146). The inflow between Lee Ferry and Hoover Dam in these 10 years was approximately 8,670,000 acre-feet (Rep. 123), making a total inflow of 110,180,200 acre-feet, offset by reservoir losses aggregating approximately 7,510,000 acre-feet (Rep. 124),[10] which reduced the quantity available—the "whole universe"—to about 102,670,200 acre-feet. This could have been regulated, at best, to an average annual discharge of only 10.27 million acre-feet from Hoover Dam. This was at a

[9]This happens to be the same critical period which the Court examined in Nebraska v. Wyoming, 325 U.S. 589 (1945).

[10]The table at Rep. 124 commences with 1935. The average evaporation for the whole period shown, 1935-1950, which included years of very low reservoir content during the filling period (1935-1941), as well as years when content was high, was 751,000 acre-feet per annum.

time when upper basin depletions averaged less than 1,680,780 acre-feet.[11] If upper basin depletions should increase only to the level which will be attained by existing and presently authorized projects, 3,840,000 acre-feet per annum (Rep. 115), an increase of 2.16 million, the residual regulated release from Hoover Dam in a dry decade like 1931-1940 would be diminished to an average of 8.11 million acre-feet per annum.[12]

The treaty requirements and net losses below Hoover Dam, based on California's evidence, projected for the future (table 6), are about 2.525 million acre-feet.[13] Subtracting these from the average Hoover Dam release last shown (8.11 million acre-feet), the residue available for consumptive use—the dependable supply—would be less than 5.6 million acre-feet per annum for Arizona, California, and Nevada.

Hence, we emphasize heavily: The water supply studies were designed to show, and did show, only the

---

[11]Determined, as the Master determines them (Rep. 111 n.40), "by comparing the historic flow with the virgin flow figures at Lee Ferry" in his tables at Rep. 117, 118.

[12]The period of 1931-1940 was not, unfortunately, an isolated phenomenon. The eight years 1953-1960 were the driest eight years in sequence in the 65-year period of record.

The 8-year total of measured runoff for the Colorado River at Lee Ferry for water years 1953-1960 was 79,285,000 acre-feet. (1953-1958, Rep. 117; 1959, U.S.G.S. Water Supply Paper 1633; 1960, U.S.G.S. Provisional Records.) The previous 8-year low was 1933-1940 with a measured runoff of 79,836,400 acre-feet (Rep. 117).

The U.S. Weather Bureau forecasts 8,000,000 acre-feet of runoff for water year 1961. U.S. WEATHER BUREAU, WATER SUPPLY FORECASTS FOR WESTERN UNITED STATES, vol. 13, No. 5 (May 1, 1961), p. 12. Adding this amount to the 8-year measured flow would result in a new 9-year low of about 87,285,000 acre-feet. The previous low for 9 consecutive years was 94,428,600 acre-feet, for 1931-1939.

[13]See p. 260 *infra*.

maximum dependable future water supply which could be made available by theoretically perfect reservoir operation. It was about 6 million acre-feet. No actual operation of the reservoir could make that much water available, for reasons the Master recognizes. (Rep. 108-09.)

4. *Bureau of Reclamation Studies, After the Close of Trial*

The latest Bureau of Reclamation study, published after the trial,[1] confirms that calculation of anticipated inflow at Lee Ferry from the upper basin is not only feasible, but is absolutely essential in determining releases from Lake Mead. We think it is judicially noticeable, and we are tendering a copy to this Court and to each of the other parties. This publication is a preview of what the Master anticipates, a determination of the total amount of water to be released by the Secretary from Lake Mead and from the several reservoirs "in his reasoned discretion" (Rep. 305).

Tables 4 and 5 in the appendix *infra* are the relevant portions of tables 5 and 7 of the 1960 Bureau report. They show the total water to be released at Hoover Dam. Sustained releases projected by the Bureau will be 9,800,000 acre-feet per annum under 1975 conditions (table 4 *infra*). They would be 8,500,000 acre-feet per annum under anticipated 2020 conditions

---

[1]Bureau of Reclamation, Regional Office, Region 4, U.S. Dep't of the Interior, Financial and Power Rate Analysis, Colorado River Storage Project and Participating Projects (September 1960).

(table 5 *infra*).[2] In both cases there would be additional releases or "spill" in some years shown in column 19. The spill must be disregarded in determining usable water supply for consumptive use. The only utility of spill is generation of nonfirm energy. Spill occurs only during the wet years when the reservoirs are full, and the report shows no spill at all from Lake Mead during the 29-year drouth period following the year corresponding to 1930.

The Bureau's projection is the latest and most authoritative statement of how the Bureau of Reclamation intends to operate the river. The water supply available for allocation to the three states, each state's allocation, and the quantity available for Metropolitan within California's allocation can all be calculated with some precision.[3] By 1975, there will be only 538,000 acre-feet available to Metropolitan (60 per cent of its use in 1960) and its whole supply will be extinguished by the year 2006.

Details of the calculation are shown in table 6 *infra*.

---

[2]By comparison, the California projection of average annual regulated Hoover Dam releases, upon which the dependable supply of 5.85 million acre-feet was based, was 8.7 million (*infra* plate 7). In December 1957, the Secretary of the Interior estimated that downstream demands for water released from Lake Mead would be 8,903,000 acre-feet in 1970, with allowance only for existing lower basin projects. S. Doc. No. 77, 85th Cong., 2d Sess. 9 (1958).

[3]For Metropolitan to receive any water at all, there must first be satisfied about 3.9 million acre-feet of senior California priorities recognized by the decree; 3.85 million acre-feet established in the Seven-Party Agreement, plus about 40,000 acre-feet of Indian priorities added by the Master. The 3.9 million acre-feet is 44/75 of 6.65 million acre-feet.

The sole fact upon which there is room for difference of opinion is the date when complete utilization will occur. We think that the Bureau's study underestimates the rate of upper basin development. We offered to establish that the upper basin depletion would expand at such a rate that Metropolitan would lose its entire supply not later than 1990. The Master denies our motion for opportunity to do so (Rep. 112 n.41). But even if the Bureau's projection of upper basin depletions were correct, there is only a 16-year difference between the two estimated dates of doomsday for Metropolitan.

V. THE PROPOSED ALLOCATION, TESTED BY THE REALITIES OF THE WATER SUPPLY, IS INCONSISTENT AND INEQUITABLE

If water were permanently abundant, the terms of a formula to allocate its use would be inconsequential. But tested against the realities of the water supply, the Master's proration formula is internally inconsistent and produces wholly inequitable results. This comes from his ignoring his own characterization of "present perfected rights" as rights in natural flow not dependent upon the existence of storage (Rep. 308), and allocating shortages in stored water as though the contrary were true (Rep. 306).

This operation of the Master's formula is described below and illustrated on plate 9 *infra*.

A. Rights in Natural Flow Not Dependent on Storage

Arizona and Nevada concede that prior to June 25, 1929, the natural or unregulated flow of the main stream of the Colorado River sustained a total of at least 3,150,000 acre-feet of beneficial consumptive use annually in California, Arizona, and Nevada. Of that total, Arizona and Nevada concede that appropriators in California beneficially consumed at least 2,900,000 acre-feet annually[4] (about 92 per cent of the total), and Arizona consumed about 250,000 acre-feet annually (or about 8 per cent of the total).[5] Any uses by Nevada from the main stream prior to 1929 were insignificant.

The foregoing figures represent the minimum of the rights California had established in natural flow, unaided by storage. We assert that our valid appropria-

---

[4]See, *e.g.*, Ariz. Reply to Defendants' Answer, par. 28(b), p. 26, in which Arizona conceded to California 2,902,000 acre-feet of such uses (reckoned by depletion); Nev. Comments on the Special Master's Draft Report, p. 24, which conceded to California for non-Indian projects 2,944,560 acre-feet of such uses. The addition of estimated Indian uses and uses on other federal reservations in California of the unregulated flow of the Colorado River before June 25, 1929, brings the total uses in California from that flow to much more than 2,900,000 acre-feet of beneficial consumptive use annually.

[5]See, *e.g.*, Nev. Comments on the Special Master's Draft Report, p. 24, acknowledging about 188,000 acre-feet of non-Indian uses in Arizona prior to June 25, 1929. To that figure has been added the estimate of actual Indian uses as of that date to reach the rounded total of 250,000 acre-feet annually. Moreover, par. 4(b), pp. 13-14, of Ariz. Reply to Defendants' Answer asserts that 73,000 acres of Arizona lands were served by water diverted from the main stream of the Colorado River as of November 24, 1922. At 3.5 acre-feet per acre of beneficial consumptive use, this would amount to about 255,500 acre-feet, or a rounded total of 250,000 acre-feet.

tive rights as of June 25, 1929, were very much larger, even if limited to those capable of being satisfied from regulated flow without Hoover Dam storage. (*Supra* Statement of the Case, p. 12 note 5.)

But the lesser quantities of California uses of natural flow conceded by our opponents will make our point.

B. Allocation of the Benefits of Storage

If, after construction of Hoover Dam, a sufficient supply from the main stream were available to satisfy 6,000,000 acre-feet of consumptive use annually (an increase over the unregulated flow of 2,850,000 acre-feet),[6] California, under the Master's "contractual allocation scheme" would receive an additional 600,000 acre-feet from the regulation provided by Hoover Dam.[7] Arizona and Nevada would share the remaining 2,250,000 acre-feet of "new" water made available by regulation.[8]

---

[6]The dependable main stream supply permanently available for consumptive use in the lower basin of 6,000,000 acre-feet per annum (*supra* p. 245) provides this increase of 2,850,000 acre-feet of water over and above the 3,150,000 acre-feet in use by June 25, 1929.

[7]44/75 of 6,000,000 equals approximately 3,500,000 acre-feet (rounded to the nearest 100,000 acre-feet), which is 600,000 acre-feet more than the 2,900,000 acre-feet which Arizona and Nevada concede was in use in California by June 25, 1929.

[8]31/75 (28/75 for Arizona and 3/75 for Nevada) of 6,000,000 equals approximately 2,500,000 acre-feet, which is 2,250,000 acre-feet more than the 250,000 acre-feet in use in both of these states by June 25, 1929.

If releases from Hoover Dam were sufficient to sustain 7,500,000 acre-feet of consumptive use annually (an increase of 4,350,000 acre-feet over that assumed to be available from the unregulated supply), California would receive only 1,500,000 acre-feet of consumptive use from the supply made available by regulation provided by Hoover Dam,[9] and Arizona and Nevada would receive 2,850,000 acre-feet of such "new" waters.[10]

In other words, if total "mainstream" consumptive use were 6,000,000 acre-feet, California would be allocated 22 per cent, and Arizona and Nevada 78 per cent[11] of the new water made available by Hoover Dam. If total "mainstream" consumptive use should be 7,500,000 acre-feet, the respective shares of the new water are 34 per cent for California and 66 per cent for Arizona and Nevada.[12]

The comparisons stated above are summarized in the following table and are shown graphically on plate 9 *infra*.

---

[9]44/75 of 7,500,000 equals 4,400,000 acre-feet, which is 1,500,000 acre-feet more than the 2,900,000 acre-feet in use in California by June 25, 1929.

[10]31/75 (*supra* note 8) of 7,500,000 acre-feet equals 3,100,000 acre-feet, which is 2,850,000 acre-feet more than the 250,000 acre-feet in use in both states by June 25, 1929.

[11]See *infra* p. 265, table A.

[12]See *infra* p. 265, table B.

Allocations of Benefits of Storage Resulting From the Master's Formula

A. If the supply will sustain only 6 million acre-feet of consumptive use:

State	Allocation	Use of natural flow	Incremental use of new water	Percentage of total incremental use of new water
Arizona	2,240,000	250,000	1,990,000	69.8
California	3,520,000	2,900,000	620,000	21.8
Nevada	240,000	0	240,000	8.4
Total	6,000,000	3,150,000	2,850,000	100

B. If the supply will sustain 7.5 million acre-feet of consumptive use:

State	Allocation	Use of natural flow	Incremental use of new water	Percentage of total incremental use of new water
Arizona	2,800,000	250,000	2,550,000	58.6
California	4,400,000	2,900,000	1,500,000	34.5
Nevada	300,000	0	300,000	6.9
Total	7,500,000	3,150,000	4,350,000	100

C. Allocation of the Burden of Shortages

But *shortages,* if the supply will not sustain consumptive use of 7.5 million acre-feet, are allocated as follows:

Allocation of Shortages in Stored Water, Contrasted With Allocation of Benefits of Storage, Resulting From Master's Formula

State	Percentage of shortage borne	Contrasting percentage of allocation of new water: If supply is 6 million	Contrasting percentage of allocation of new water: If supply is 7.5 million
Arizona	37⅓ (28/75)	69.8	58.6
California	58⅔ (44/75)	21.8	34.5
Nevada	4 (3/75)	8.4	6.9
Total	100	100	100

In summary, the Master's formula awards the lion's share of the new water (66 to 78 per cent) to Arizona and Nevada and 22 to 34 per cent to California, while burdening California with 58-2/3 per cent of any shortage below 7.5 million (unless the total supply falls below 3,150,000 acre-feet, far below any possibility suggested by anyone).

If this is the law, and always was, the question naturally arises why Arizona opposed passage of the Boulder Canyon Project Act, containing the provisions which the Master reads as dictating this result, and why Arizona, in three previous trips to this Court, has attacked the Project Act.

The Master's formula, applied to the realities of the water supply, produces a result so palpably illogical as to demonstrate that there is something wrong with its whole structure, its premises as well as its conclusion.

VI. THE PROPOSED ALLOCATION, TESTED BY THE REALITIES OF THE WATER SUPPLY, WOULD DESTROY THE WATER RIGHTS OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA, AND SHOULD BE REJECTED ON EQUITABLE GROUNDS

The burden of the Master's formula falls with particular weight on Metropolitan Water District. In consequence of the internal California priorities which the Master recognizes (Rep. 201, 256 n.4; Decree arts. II(C)(1), III(B), Rep. 350, 353), this district receives no water at all if the supply available for Arizona, Cali-

fornia, and Nevada is insufficient to sustain at least 6.65 million acre-feet of consumptive use.[1]

No testimony or calculation in the record, with one exception, supports an estimate of dependable supply as great as 6.65 million acre-feet. The sole exception was based on a hypothesis by Arizona counsel as to the upper division's obligations under Article III(c) of the Compact, later disowned by Arizona counsel.[2]

Even if the Project Act is construed to have created a "contractual allocation scheme," inferentially displacing priorities by proration, *sub silentio,* there is nothing to indicate that it also, *sub silentio,* abrogated the other great element of the law of equitable apportionment, *i.e.,* the protection of existing uses, and directed the disregard of existing uses in favor of new ones. Every element of equity weighs against such a result, particularly with respect to Metropolitan Water District, for reasons uniquely applicable to it.

Metropolitan Water District alone, of those who have contracted with the Secretary for the storage and delivery of water, was required to, and did, agree to underwrite a portion of the cost of Hoover Dam as a consideration for getting its water contract. Its water and power contracts were orginally made under section 4(b) of the act,[3] as well as under section 5. Under the terms of the Boulder Canyon Project Adjustment

---

[1]See p. 260 note 3 *supra.*

[2]*Supra* p. 245 note 4.

[3]Section 4(b) of the Project Act provides, with respect to Hoover Dam (Rep. app. 383-84):

"(b) Before any money is appropriated for the construction of said dam or power plant, or any construction work done or

Act,[4] it was required to, and did, agree to pay for 35 per cent of the firm energy to be generated at Hoover Dam, to be used only to pump project water through its aqueduct, whether the power is used or not.[5] It paid the United States $5,886,263 in fulfillment of its obligation to pay for unused energy.[6] The Secretary's findings under that act[7] show that payments by Metro-

---

contracted for, the Secretary of the Interior shall make provision for revenues by contract, in accordance with the provisions of this Act, adequate in his judgment to insure payment of all expenses of operation and maintenance of said works incurred by the United States and the repayment, within fifty years from the date of the completion of said works, of all amounts advanced to the fund under subdivision (b) of section 2 for such works, together with interest thereon made reimbursable under this Act."

[4]54 Stat. 774 (1940), as amended, 43 U.S.C. §§ 618-618*o* (1958).

[5]Calif. Ex. 415 (Tr. 9,395), art. 14, quoted in Sp. M. Ex. 2 for iden. (Tr. 212) at 333; *id.* art. 7(c)(1), at 325, as amended by Calif. Ex. 416 (Tr. 9,395), art. 5, quoted in Sp. M. Ex. 2 for iden., *supra*, at 352; see also Calif. Ex. 417 (Tr. 9,395), arts. 9(a) and 14(a), quoted in Sp. M. Ex. 2 for iden. (Tr. 212) at 861, 865.

[6]Tr. 9,669 (McKinlay); Calif. Ex. 482 (Tr. 9,395), col. 4. Since 1940, the increase in costs of steam-generated power has made it possible for the Secretary to resell unused Metropolitan power at its contract rates, crediting the proceeds to the district's obligation. As long as this situation prevails, it is not expected that losses of this type will recur.

[7]See the Secretary of the Interior's Third Annual Report of Operations Under the Boulder Canyon Project Adjustment Act (1945), table facing p. 30. Total anticipated revenues from firm energy sales are $229,359,882 (column 7), of which Metropolitan is obligated to pay about 35% (see contracts cited note 5 *supra*), or about $80,000,000. Anticipated revenues of $7,569,220 (column 9) from charges for stored water are all derived from Metropolitan. Thus Metropolitan's scheduled share of the $251,000,000 cost of Hoover Dam (column 10) is about $88 million.

politan over a 50-year period are expected to provide about $8,000,000 for stored water and about $80,000,000 for power to be used to pump that water. These revenues amount to over a third of those relied upon by the Secretary to meet the revenue requirements of the act. Only Metropolitan and the State of Nevada, of all water contractors, have been required to pay for the use of stored waters; in contrast, not a dime has been paid by Arizona or any Arizona user for stored water.[8]

The Master may or may not be right in saying that some section 5 water delivery contracts, notably Arizona's, "are not contracts in the ordinary sense" and that the "Secretary is bound by those terms, as are the contractees, not because of the legal chemistry of offer, acceptance and consideration, but because they are part of the statutory scheme provided for in the Boulder Canyon Project Act" (Rep. 207). But the Master is demonstrably wrong as to Metropolitan Water District's contract. The Metropolitan water contract and its concomitant power contract were made under section 4(b) as well as section 5, and the two are certainly contracts in the ordinary sense, containing all of the elements of offer, acceptance, and consideration—$88 million of it (as demonstrated in the preceding paragraph).

In reliance on that contract, Metropolitan Water District has spent approximately $400 million of its own

---

[8]Calif. Ex. 2718 in part in evidence and in part for iden. (Tr. 17,234-35); U.S. Dep't of Interior, Bureau of Reclamation, Determination of Energy Rates Effective June 1, 1960, schedule 1.

money to build the Colorado River Aqueduct Project.[1] In addition, San Diego County Water Authority, as of November 30, 1956, had expended about $43,300,000 for the San Diego Aqueduct, and its unpaid obligation to the United States therefor was about $56,770,000. In 1960, the third barrel of the San Diego Aqueduct was completed at a cost of $55,000,000, of which Metropolitan will pay $20,000,000 and the Authority will pay $35,000,000.[1a] Further, Metropolitan Water District contributed over $7,000,000 to the United States for the construction of Parker Dam[2] to impound Havasu Lake as a diversion point. One of the proposed Central Arizona Project routes would make similar use without cost of the lake thus created.

The interpretations of the Project Act and Compact relied upon by Metropolitan in making these investments under its Government contracts were substantially the same interpretations as were then asserted by Arizona—and asserted as the reason why Arizona rejected the Compact and sought to enjoin construction of the dam whose benefits are now awarded her and taken from Metropolitan Water District.[3]

Congress has enacted at least four important pieces of legislation implementing Metropolitan's Colorado River Aqueduct Project and clearly must have been

---

[1]See 22 MWD ANN. REP. (1960), table 6, at 11, "Grand Total $212,356,138"; table 14, at 27, grand total $172,842,930; *id.*, estimated cost of the northerly 36.3 miles of First San Diego Aqueduct (2 barrels) $15,479,449. These items total $400,678,517.

[1a]See appendix, pp. A33 and A34.

[2]See Metropolitan Finding MWD:114, p. MWD-26; Calif. Ex. 477 (Tr. 9,395), at 4.

[3]Calif. Exs. 1340 (Tr. 11,548), at 2-4; 1342 (Tr. 11,553); and 2042 (Tr. 12,375).

aware that the district's water contracts were the foundation of that project.[4] They have also been called to this Court's attention in Arizona's prior suits here.[5]

It would come with particular irony if Metropolitan Water District, the integrity of whose obligation assures repayment of a third of the Government's investment in Hoover Dam, should see its aqueduct rendered useless in order to provide Arizona with water—water which would not be available at all if Hoover Dam did not exist, for an aqueduct in the state which did its utmost, in Congress and in this Court, to prevent construction of that same dam.

This result is not equitable. The principle involved need not be catalogued with nicety as estoppel, or preclusion, or timeliness, or by another name. Such labels are not important. *Cf. Tacoma v. Taxpayers of Tacoma*, 357 U.S. 320, 336-37 (1958).

Perhaps the best name for the principle invoked is just "fair play."

---

[4]By the Act of June 18, 1932, 47 Stat. 324, Congress granted the district a right of way for the aqueduct across the public lands. Calif. Ex. 450 (Tr. 9,395). Section 2 of the Act of Aug. 30, 1935, 49 Stat. 1039, authorized the construction of Parker Dam and "validated and ratified . . . all contracts and agreements . . . executed in connection therewith." Calif. Ex. 472 (Tr. 9,395). The acts of April 15, 1948 (62 Stat. 171), Calif. Ex. 500 for iden. (Tr. 9,395), and Oct. 11, 1951 (65 Stat. 404), Calif. Ex. 502 (Tr. 9,395), authorized the first and second barrels of the San Diego Aqueduct.

[5]Arizona v. California, 298 U.S. 558, 564 (1936); United States v. Arizona, 295 U.S. 174, 181, 186-87 (1935); Arizona v. California, 283 U.S. 423, 450 (1931).

The principle is recognized by the Master, its application refused. The principle is that which the Master himself applies on the upper Gila (Rep. 326):

> "It is worthy of note that the Court, in an equitable apportionment suit, has never reduced junior upstream existing uses by rigid application of priority of appropriation. Indeed, the tendency has been to protect existing uses wherever possible. See *Washington v. Oregon,* 297 U.S. 517 (1936); *Kansas v. Colorado,* 206 U.S. 46 (1907)."

A fortiori, this salutary rule should apply where, as here, the use which would be destroyed is that of a long-established and senior use vis-a-vis Arizona's "paper filing," her 1944 water contract.[6]

No decree of this or any other court has ever worked such destruction. We believe this very fact is a compelling reason to believe there is legal error in the decision which would produce it. Even the Master conceded from the bench during argument in New York City in 1960 the relevance of water supply in this sense:

> "I suppose it is true that if a particular determination would lead to a genuine disaster, I suppose we would agree that that would be a good reason for reexamining it to see whether perhaps we did fumble somewheres en route and perhaps the Court ought to so fashion its decree so that disaster should be avoided." (Tr. 22,976.)
>
> ". . . .

[6]Rep. 307-08. The Master ascribes to the Project Act the intent to reject all priorities of "paper filings." The term is appropriate to describe Arizona's 1944 contract, but not the water rights of projects in existence or under construction which had become the foundation of a going economy.

"I naturally am very deeply concerned about any set of facts or arguments which suggest the possibility that the spigots on the Metropolitan Aqueduct will have to be turned shut, and if I believed any such thing I would have strained every legal document to try to prevent that because I adhere to the notion that it is true that some of the authors you quoted the other day—that such projects should not be turned off because some interesting legal conception is valid and it has some property significance along the lines you argued this morning.

"I have not heretofore persuaded myself that such was the fact. Nothing I have heard suggests that such is the fact and nothing persuades me that such is likely to be the fact within the unforeseeable future, not to say foreseeable future." (Tr. 23,-092-93.)[7]

---

[7]Plate 10 *infra* shows graphically the flow at Lee Ferry required to fulfill the Master's assurance that his formula will not occasion shortage to Metropolitan. Shortly stated:

1. A Lee Ferry flow of at least 11.174 million acre-feet is needed to furnish Metropolitan a full supply. Losses below Lee Ferry included in this calculation are the lowest projected in the evidence, in association with reservoir capacity existing and authorized.

2. A Lee Ferry virgin flow of 13.724 million acre-feet is needed to furnish Metropolitan a full supply and to sustain only the 2.55 million acre-feet of upper basin depletions which will exist by 1963. This is *greater* than the average virgin flow for the period 1930-1956, which was only 13.085 million. Calif. Exs. 2202, 2202A (Tr. 11,713A).

3. A Lee Ferry virgin flow of 15.015 million acre-feet is needed to furnish Metropolitan a full supply and to sustain only the 3.841 million acre-feet of upper basin depletions which will exist by 1970. This is only 165,000 acre-feet less than the average annual virgin flow for the whole period of flow in evidence at the trial, 1896-1956. (*Id.*)

4. A Lee Ferry virgin flow of 18.67 million acre-feet is needed to furnish Metropolitan a full supply and to sustain

In the New York City argument he also declared his certainty that "neither in my lifetime, nor in your lifetime, nor the lifetime of your children and great-grandchildren will there be an inadequate supply of water" for the Metropolitan Aqueduct "or its contemplated expansion." (Tr. 23,084.) Under the formula devised by the Master, realization of that prophecy requires 8,824,000 acre-feet per annum[8] of consumptive use from the "mainstream" (ignoring California Indian uses), and a flow of substantially more than 11,000,000 acre-feet at Lee Ferry to include satisfaction of the Mexican Treaty burden and unavoidable evaporation and transit losses.[9] (See appendix, pp. A44-46.)

The Master now modifies this assurance, saying that consumptive use of 7,667,770 acre-feet per year[10] from

---

depletions in the amount of the upper basin's full apportionment of 7.5 million acre-feet. This is impossible. It is nearly a million acre-feet in excess of the virgin flow for the *wettest* period of record, 1909-1929. (*Id.*)

[8]For Metropolitan Water District to receive a full supply of 1,212,000 acre-feet, junior as this district is to 3,850,000 acre-feet of senior priorities, California would have to receive 5,062,000 acre-feet. As this is 662,000 in excess of 4.4 million, the Master's formula would accord Arizona and Nevada 662,000 acre-feet in excess of 3.1 million, or 3,762,000.

[9]*Supra* p. 273 note 7.

[10]The Master's figure of 7,667,770 acre-feet should be 7,872,784 acre-feet. He tabulates California's existing uses at 4,483,885 acre-feet per annum. (Rep. 128.) Footnote 73, on the cited page, reveals that in 1957 Metropolitan Water District's uses had increased by more than 100,000 acre-feet, making the proper total 4,586,392 acre-feet. The computation of the "mainstream" consumptive use required to provide 4,586,392 acre-feet for California under the Master's formula is derived by working the formula backward:

Three states		California		Arizona		Nevada
7,500,000	(44/75)	4,400,000	(28/75)	2,800,000	(3/75)	300,000
372,784	(1/2)	186,392	(1/2)	186,392		0
Total 7,872,784		4,586,392		2,986,392		300,000

what he calls the "mainstream" would satisfy all of California's "existing uses," approximately 4.6 million acre-feet per annum in 1957, under his formula. (Rep. 104.) This would curtail Metropolitan Water District to about two thirds of what it is now using; the event will not wait upon the arrival of our great-grandchildren.

The Report says (Rep. 102):

> "[California] contends that application of the apportionment formula recommended in this Report to this supply of water would *seriously curtail existing uses of mainstream water in California and might eliminate all diversions by the Metropolitan Water District,* which serves Los Angeles and other cities on the Southern California coastal plain.
>
> *"While legally irrelevant, such a result, if at all probable, would arouse the greatest apprehension.* However, the record in this case gives no indication that the 'chaotic disaster' which California fears will, or is likely to, materialize. *Her dire predictions appear to be unfounded."* (Emphasis added.)

The last sentence contradicts everything the Master states about justiciability (Rep. 129-35), and in the same breath, the Master rejects all scientific evidence and refuses to receive any evidence at all on the anticipated rate of depletion in the upper basin, which together are the bases of what are not only "dire predictions," but inescapable certainties.[1]

---

[1]See table 6 *infra.*

In these circumstances, disagreement as to the rate of expansion of upstream depletion is immaterial. If the Master's decree is adopted, only the date of the Colorado River Aqueduct's extinction is uncertain.

This problem is not capable of solution, as the Master suggests it may be, by hopes for changes in "supply conditions" (*i.e.*, more rain?) or for advances in "conservation or even production of water" (Rep. 114). If such risks are to be taken, let them be borne by the new project which asserts such hopes. As an alternative, the Master suggests in a footnote (Rep. 103 n.25) that a substantial reduction can be made in the amount of water needed to satisfy existing California uses, such as by reducing the runoff to the Salton Sea. This question was vigorously litigated for several weeks. Arizona did not even submit proposed findings on the subject, possibly because it developed that (1) the runoff to the Salton Sea is essential to prevent accumulation of salts in Imperial Valley lands,[2] (2) the farm efficiency (*i.e.*, the ratio of the quantity of water consumed by crops to the quantity diverted) of Imperial Irrigation District is among the highest of all reclamation projects in the lower basin,[3] (3) the farm efficiency which Arizona would require of Imperial is 75 per cent, whereas the Central Arizona Project would yield only 52 per cent.[4] It is surprising to find the issue revived (it was not mentioned in the Master's draft report nor in any comments on it), and so casually disposed of,

---

[2]See summary in Calif. Finding 4C:106, pp. IV-21 and IV-22, particularly note 5.

[3]Calif. Exs. 5106-5109 (Tr. 20,768-69); Calif. Ex. 5110 for iden. (Tr. 20,769); Calif. Exs. 5111-5113 for iden. (Tr. 20,774); Calif. Finding 4C:106, pp. IV-21 through 24.

[4]Calif. Ex. 3047 (Tr. 19,860).

via a footnote, to California's disadvantage. If water is to be saved by improved efficiencies, let it first be done on the Arizona "mainstream" projects (Rep. 127). The diversion per acre is higher than it is for Imperial Irrigation District,[14] and the Master is unable to ascertain any figure for return flow from those Arizona projects which will enable him to compute their consumptive use (Rep. 126-27).

VII. CALIFORNIA DOES NOT ASK THAT UNUSED UPPER BASIN WATER WASTE TO THE SEA, BUT THAT THE RISK OF ITS ULTIMATE WITHDRAWAL FALL UPON THE PROJECTS HEREAFTER CONSTRUCTED TO USE IT

California does not ask that any water be required to run to the Gulf of California unused. Rather, we ask that the priorities of the three existing projects in California, and of all existing and authorized projects in Arizona and Nevada, be recognized in the dependable supply, and that the risk of ultimate loss of the water supply in excess of that which is permanently dependable, that is to say, the excess which the lower basin may use only until the upper basin uses its Compact apportionment, be borne by projects which may be authorized in the future. By this we mean, primarily, the proposed Central Arizona Project. If the water supply is as abundant as the Special Master seems to believe, this presents no hazard to that proposed project. If he is wrong, the hazard should not fall upon the projects long since built and the going economy which they sustain.

---

[14]Calif. Ex. 5106 (Tr. 20,768).

The Master obviously is not persuaded that we are correct about the realities of the water supply. There has been a failure of communication on a subject which is at the heart of the controversy. We believe that this case should not be decided until the Court has had the benefit of the best and most precise information available as to how its decree will affect 7,000,000 people who now depend on Colorado River water from projects, the newest of which has been in operation 20 years. To that end, we suggest to this Court the course of action we proposed by motion to the Master:[5] That the Court appoint, or cause to be appointed, its own experts to examine and report expeditiously on the permanent water supply available from the main stream in the Colorado River basin. Our motion to the Special Master for that purpose is incorporated in the appendix at page A39. We now renew that motion before the Court.

---

[5]See Calif. Comments, Suggestions, and Motions re Draft Report, submitted June 10, 1960, pp. 62-63.

PART SIX

MISCELLANEOUS MATTERS

1. *The Colorado River Indian Reservation Boundary*

Because of the theory that he adopts as to the measure of water rights for Indian reservations, with which we disagree, (*infra* pp. 283-84), the Special Master finds it necessary to determine the location of a disputed portion of the western boundary of the Colorado River Indian Reservation, located in Arizona and California on the main stream of the Colorado River below Lake Mead. (Rep. 255-57, 274-78.)

The Master's characterization of the boundary dispute as "minor" (Rep. 6 n. 12) accurately describes its posture in this water rights controversy. It is, however, definitely of the first magnitude if it is in any way to be a binding adjudication of land titles or political jurisdiction. Indeed, it is a major lawsuit in itself, involving substantial private and sovereign interests.[1]

---

[1]The dispute involves some 2,280 acres of rich agricultural land located within the service area of the Palo Verde Irrigation District. The lands are presently assessed by the district pursuant to California law, some of them since 1927, and are irrigated through the district's facilities and those of the present non-Indian occupants and claimants of the land. See Calif. Finding 18D:113, p. XVIII-38. A major point of controversy centers on alleged avulsive changes in the course of the Colorado River in the reach of the river where it forms the boundary between Arizona and California. Similar difficult issues on other rivers have occupied the attention of this Court in a number of major interstate boundary disputes. See, *e.g.*, Kansas v. Missouri, 322 U.S. 213 (1944); Arkansas v. Tennessee, 246 U.S. 158 (1918); Indiana v. Kentucky, 136 U.S. 479 (1890).

The Master states his reasons for adjudicating the magnitude and priorities of the federal claims for "mainstream" Indian reservations as follows:

> "Since the Secretary cannot know how to operate Hoover Dam and the mainstream works below unless the controversy between the United States and the States of Arizona and California is resolved, since failure to adjudicate it will leave non-Indian users in doubt as to the water available for their use, and since this controversy has been properly presented in this case, it is appropriate to adjudicate it here." (Rep. 256-57.)

California contends that it is unnecessary to make a determination of the Colorado River Indian Reservation boundary dispute in order to achieve the stated objectives, and that an unqualified determination[2] of this dispute will unfairly prejudice the rights of the present non-Indian occupants of the disputed area who are not before the Court. Postponing determination of the boundary dispute does not materially affect the priority of the water right to which the lands are entitled. Palo Verde Irrigation District has the senior priority under the Seven-Party Agreement among the California defendants (Rep. app. 425), and the Master awards the disputed area an Indian priority dating from 1876 (Rep. 273). Consequently, since the disputed lands

---

[2]If the Court decides that a determination of the magnitude and priority of the Indian water rights for the disputed area will be useful, the determination could be made expressly contingent on the United States subsequently establishing title to the disputed lands in appropriate proceedings. The Master makes such a conditional determination in his treatment of certain lands involved in the Fort Mohave Indian Reservation boundary dispute. (Finding 14, Rep. 281-82; conclusion 6, Rep. 283.) A similar ruling on the Colorado River Indian Reservation dispute would be even more appropriate.

hold one of the earliest priorities on the river, regardless of the location of the boundary, neither the Secretary nor non-Indian users can be uncertain as to the rank of priority to which the lands are entitled.[3]

The Special Master asserts that his findings will be binding on the parties, but that "in the hearings and in this Report, [he] did not inquire into or determine the right of any occupant, whoever he might be, to the possession of lands within the questioned areas" (Rep. 278). We interpret this statement as indicating that the Special Master does not purport to adjudicate land titles in the disputed areas, in accordance with his unequivocal assurances to this effect during the hearings.[4]

---

[3]For example, the Report awards substantial quantities of water to the United States for the Lake Mead recreational area (Rep. 295) and the Havasu Lake and Imperial wildlife refuges which lie along the river boundary between states (Rep. 298-300). It does not, however, specify exactly how much of each of these areas lies in each state, even though these federal uses are to be charged against the allocation of the state where they are made (Rep. 312-13). Apparently, the Master does not consider that this unresolved matter will create uncertainty for either the Secretary or water users.

[4]On the Fort Mohave Indian Reservation boundary dispute, tried in conjunction with the dispute on the Colorado River Indian Reservation, the Master declared (Tr. 20,371): "It is not my function to pass on titles. It is only to determine how much water the Indian reservation is entitled to, and there is a margin of error there that you are entitled to pursue." Similarly, with reference to the Colorado River Indian Reservation dispute, the Master asserted that "manifestly we are not going to determine legal title to that [disputed area] in this lawsuit." (Tr. 20,289.)

The Special Master had previously taken note of California's objection that he had no jurisdiction to determine land titles and that California was representing its citizens as *parens patriae* solely with respect to water rights, not land titles. (Tr. 19,998-20,000.) With reference to the status of the party states as representatives of their water users, the Special Master has declined to adjudicate intrastate priorities of water users not actually before the Court. (See, *e.g.*, Rep. 218, 255, 256 n.4, 332.)

However, it is unfair to prejudice any of the parties in future litigation over land titles or political jurisdiction by approving findings on a tangential issue never pleaded by the United States,[5] and made relevant solely by virtue of the new ground broken by the Master in the field of Indian water rights. The United States should not be permitted, as an incident to its claims for water for the Indian reservations in the lower basin in this water rights litigation, to obtain an unqualified adjudication of jurisdiction and title to valuable lands. Consequently, if the Master's theory of the measure of Indian water rights is adopted, we ask that the Court include the following disclaimer in the decree as article VIII(D) (Rep. 360) to provide that it shall not affect:

> "(D) Any right, claim, or interest in land, or jurisdiction with respect to land, by any person, natural, corporate, or political, whether or not a party to this cause."

As to the merits of the Master's interpretation of the Executive Order of May 15, 1876 (Rep. 270-71), we agree that it established a boundary which changes as the course of the Colorado River changes, but disagree that it fixed the west bank of the Colorado River, rather than the center of the river, as the western boundary of the reservation. The lands comprising the west half of the bed of the navigable Colorado River were not part of the public domain subject to reservation in 1876, since title had previously vested in California on its admission as a state in 1850. See *United States v. Arizona,* 295 U.S. 174, 183 (1935); *United States v. Utah,* 283 U.S. 64 (1931).

---

[5]See Calif. Finding 18D:119, p. XVIII-45.

Consequently, it is unreasonable to construe the order as purporting to reserve lands which were not in federal ownership. If the order is construed as making the center of the river the boundary, the withdrawal is reasonably confined to the federal lands comprising the east half of the bed of the river (then part of the Arizona territory), and the objective of providing a water boundary for that part of the reservation in Arizona[6] is just as fully achieved. In any event, it is clear that the order could not affect the title of the State of California to the west half of the bed of the Colorado River. See *Deseret Water, Oil & Irr. Co. v. California*, 167 Cal. 147, 138 Pac. 981 (1914), *rev'd on other grounds*, 243 U.S. 415 (1917).

Secondly, as to the Master's conclusion that the so-called Olive Lake and Ninth Avenue cutoffs effected avulsive changes in the course of the Colorado River in those areas (Rep. 273, 278), we think it clearly erroneous. The meager evidence adduced by the United States upon which the Master bases his conclusion[7] falls far short of satisfying the difficult burden of proof on a party alleging an avulsion in a water boundary.[8]

2. *Federal Rights for Indian Reservations and Other Federal Lands*

We emphatically disagree with the Special Master's determinations with respect to (1) the basis upon which water rights for Indian reservations and other federal lands in the lower basin are predicated, (2) the

---

[6]See Rep. 270, Finding 4.

[7]Rep. 271-72. Compare Calif. Findings 18D:122-25, pp. XVIII-48 through 51.

[8]See Calif. Conclusion 18D:208, p. XVIII-52, and cases cited.

quantities impliedly reserved for those reservations, and (3) the priorities accorded to them.

We recognize that the United States may, in setting aside public lands for Indian reservations, similarly reserve waters upon those public lands, either expressly or by implication, for the reasonable future needs of the Indians who are to inhabit those reservations. The United States did not expressly reserve water for the "mainstream" reservations involved in this dispute. Our disagreement is with the Master's findings of *implied* reservations (Rep. 259-60) in the face of substantial evidence to the contrary, and (assuming water was impliedly reserved) his determination that the reasonable needs of the Indians are measured by the irrigable acreage on each reservation (Rep. 262).[9]

However, since the quantities of water for such reservations in California are relatively small, and because none of the parties seem to have excepted to the Special Master's decision that all federal uses in Arizona and Nevada are chargeable to those states out of water from which California uses are excluded by the limitation on California (Rep. 247), we do not brief these questions.

3. *The Inappropriateness of Injunctive Relief*

Except for the controversy between Arizona and New Mexico over Gila River system waters, this suit is declaratory in nature. Therefore, the Special Master errs in casting the provisions of Articles II and III of his

---

[9]See our comments on the Special Master's draft report pp. 45-53 (June 10, 1960). We briefed the question of Indian water rigths before the Special Master. See Calif. Opening Brief, vol. 1, pp. 188-95, April 1, 1959; Calif. Response to U.S. Opening Brief, pp. 112-27, June 11, 1959.

recommended decree concerning the "mainstream", in terms of injunctive relief against any party.

There can be no wrongful conduct by the California defendants inasmuch as the United States, under the Master's decree, controls the Colorado River from Lake Mead to the international boundary. Projects to divert Colorado River water for use in Arizona and Nevada will be constructed by the United States or under its authority, on or across federal lands. The California defendants could not interfere with such construction. Water to supply those projects will be delivered by the Secretary of the Interior who alone can effectively prevent any interference with such deliveries by any California defendant.[1]

Finally, no party has expressed any intention to violate any provision of the decree which may be entered by this Court. The California defendants expressly declare that they will not knowingly violate any provision of the decree of this Court.

In *Wyoming v. Colorado,* 298 U.S. 573 (1936), this Court refused to grant injunctive relief under circumstances which might otherwise justify issuance of an injunction in a suit among nonsovereign litigants. This Court held that certain diversions in Colorado "contravene the decree" which had been entered in an

---

[1]Arizona also excepts to the injunctive provisions in articles III(B), (C), and (D) of the recommended decree (Rep. 353-54). Arizona argues that these provisions attempt to transfer to the State of Arizona the duties imposed upon the Secretary of the Interior by the Project Act and his water delivery contracts. Arizona also argues that her authority to prevent interference with the diversions, and uses referred to, is in serious doubt. See Ariz. Motion for Adoption, With Exceptions, of the Master's Report, Exception 35, p. 23. These reasons are equally applicable to the California defendants, and we therefore join in Ariz. Exception 35 for the reasons therein stated.

earlier decision (259 U.S. 496 (1922)) and "infringe Wyoming's rights under it." (298 U.S. at 579.) The Court then stated (*ibid*):

> "They [the unlawful diversions in Colorado] were being practiced when the present suit was begun and for a time thereafter, but when the motion to dismiss was overruled they were discontinued pending further action by us. Counsel for Colorado now assure us in their brief that the State does not propose to permit a resumption of these diversions if we hold, as we now do, that they contravene the decree. Because of this assurance, which we accept, there is no present need for granting an injunction in respect of these diversions."

Since injunctive relief was not given in the circumstances described above in *Wyoming v. Colorado, a fortiori,* no injunctive relief should be granted in *Arizona v. California* concerning lower basin waters other than the Gila River system.

Finally, article III of the recommended decree runs not only against the State of California but also against the defendant agencies in this state, unfairly subjecting those agencies to an injunction which does not apply to their counterparts in Arizona and Nevada. There is no basis for such inequitable discrimination.[2] If

---

[2]During the trial of this cause, Arizona was able to secure information from the California defendant agencies by discovery procedures and to put such information in evidence without difficulty because these agencies had been joined as parties by Arizona when she brought this suit. (*E.g.*, Order Requiring Imperial Irrigation District to Permit Inspection and Copying or Photographing Records, entered May 17, 1957.) However, California had no effective means of securing information from similar agencies in Arizona which were not parties to this suit.

injunctive relief is to be granted against California by this Court's decree, it should run only against the State of California, not its public agencies.

4. *The Retention of Jurisdiction for Future "Mainstream"—"Tributary" Controversies*

The Special Master holds that the doctrine of equitable apportionment still controls the rights of "mainstream" users against users in other states of waters from lower basin "tributaries" including users from the main Colorado River between Lee Ferry and Lake Mead (Rep. 316-18.) "California," assures the Master, "will be able to protect herself against undue depletions on tributaries and the mainstream above Lake Mead by compact, or, if the necessity arises, by suit." (Rep. 247.)

The Special Master provides in article IX of his recommended decree that (Rep. 360):

> "IX. Any of the parties may apply at the foot of this decree for its amendment or for further relief. The Court retains jurisdiction of this suit for the purpose of any order, direction, or modification of the decree, or any supplementary decree, that may at any time be deemed proper in relation to the subject matter in controversy."

In any lower basin suit involving the waters controlled by Hoover Dam, the United States is an indispensable party. *Arizona v. California,* 298 U.S. 558 (1936). The present suit is possible only because the

---

Furthermore, it was more difficult for California to lay a sufficient foundation for admission of this material into evidence. (*E.g.,* Tr. 3,108-09, 3,424-31; Calif. Ex. 18 for iden. (Tr. 3,428).) This inequity ought not to be perpetuated by this decree.

United States voluntarily intervened. (See Rep. 2 n. 5a.)

The Master holds that no justiciable interstate controversy presently exists between "mainstream" users and "tributary" users. (Rep. 318-21.) However, he does not specifically provide in article IX of his recommended decree that jurisdiction is retained to adjudicate such controversies if, as, and when they become justiciable.

California should not be placed at the mercy of the decision of the United States to intervene or not to intervene if a new suit should be necessary by California against Arizona. For example, the main Colorado River above Lake Mead within the lower basin includes alternative points of diversion (Rep. 227-28) for the Central Arizona Project, which, Arizona alleged, was the precipitating cause of this litigation (Ariz. Bill of Complaint, par. XX; Rep. 30-31, 130-31). This stretch of the river, however, is outside the terms of the recommended decree (Recommended Decree, art. I(B) and (F); art. VIII(B)) and is left to adjudication in future litigation (Rep. 247, 316-21).

If the Master's truncation of the river system is sustained, we suggest that the decree expressly declare what was probably intended by the language of article IX of the recommended decree, by adding the following language: "including, but not limited to, any interstate proceeding to adjudicate the right of states diverting from the 'mainstream' as against states diverting from the main Colorado River between Lee Ferry and Lake Mead and from all lower basin tributaries."

5. *The Inclusion of Underground Water Uses*

Article I(A) of the Master's recommended decree (Rep. 345) provides that for the purposes of the decree:

> "(A) 'Consumptive use' means diversions from the *stream* less such return flow thereto as is available for consumptive use in the United States or in satisfaction of the Mexican Treaty obligation." (Emphasis added.)

The apportionments made by the recommended decree are in terms of consumptive use (*e.g.*, Rep. 347-50, Decree art. II(B)).

The term "stream" in article I(A) of the recommended decree is too limiting a concept to effectuate the evident purpose.

In dealing with New Mexico uses from the Gila River system, the Report and the recommended decree recognize the relationship between surface water and underground water.[3] This same relationship applies to the main stream.[4] There are projects located along the "mainstream" which presently pump and consume substantial quantities of ground water interconnected with the "mainstream" water.[5] Certainly all water taken and consumed, whether extracted from above or below the ground, should be charged against whatever rights the state in which such water is consumed may have under the decree.

In order to avoid any ambiguity, therefore, we suggest inclusion of the following parenthetical phrase af-

---

[3]Rep. 338, findings 12-14; Rep. 354-58, art. IV.

[4]See, *e.g.*, Tr. 11,859-64 (Marliave), Tr. 19,170-72 (Turner), for a description of the interconnection of the surface flow of the Colorado River and underground water in the Yuma, Arizona, area.

[5]See, *e.g.*, Tr. 2,209, 2,382 (Steenbergen); Ariz. Exs. 76 (Tr. 318), table 2, and 79 (Tr. 327), at 6, re ground water pumping in the South Gila Valley.

ter the word "stream" in article I(A): "(including all related underground water)".[6]

6. *Holders of Natural Flow Rights Are Entitled to Water Delivery Contracts*

Article II(C)(1) of the recommended decree requires the Secretary to respect state law in the release of water. It does not, however, require the Secretary to issue a contract to holders of natural flow rights pre-existing the enactment of the Project Act.

We hope, of course, to persuade the Court that the applicable law is contained in the ruling by the Secretary of the Interior in 1930 which was the law relied on when the contracts were written:

> "Those possessed of prior rights to the unregulated flow of the river will be privileged to continue the enjoyment of those rights without interference by storage in the Boulder Canyon reservoir." (Calif. Ex. 351, Tr. 9,929.)

There are riparian rights in California, inconsequential in amount, but which may be senior to the appropriative rights recognized in the existing California water delivery contracts. As minimum protection for water users who have relied on the Secretary's decision construing section 5 of the Project Act as applicable only to stored water, the Secretary should be required to issue contracts to the holders of such rights. Such contracts would in no way increase any state's apportionment.

---

[6] A similar suggestion was made by Nevada. See Nev. Comments on Draft Report, p. 18; transcript of decree conference, Aug. 19, 1960, pp. 11-12.

Accordingly, article II(B)(7)(Rep. 349) should be amended by the addition of the following two sentences:

"The Secretary of the Interior shall issue a contract to any water user in any state, certified by the official or agency in that state responsible for administration of water rights, to have a water right which entitles the water user to use water, which certification shall include all data specified in Article VI. The contract shall entitle the contractee to use water to the extent available under the state's apportionment in accordance with the priority date and quantity of the right certified."

CONCLUSION

The decree which California seeks is fair and equitable, and conforms to every limitation which California has agreed to. That decree would confirm California's existing rights to the annual consumptive use of 4,400,000 acre-feet from the first 7,500,000 acre-feet of annual consumptive use from the Colorado River main stream and tributaries in the lower basin. It would recognize California's rights in one half of excess or surplus annually available over and above that first 7,500,000 acre-feet. It would recognize interstate priorities and principles of equitable apportionment in apportioning the burden of any shortages within the first 7,500,000 acre-feet. It would fully protect all existing main stream projects in Arizona and Nevada, to the full extent of their ultimate development. Only California projects would receive less than their full requirements.

If the Master's optimism about the quantities of water to be available is justified, such a decree would permit expansion of lower basin uses by construction of new projects in Arizona and Nevada. We do not oppose any such projects, if the risk of miscalculation of the water supply rests (as it does in every state of the arid West) on the new ventures, rather than on the existing projects built on the basis of decisions not now reversible and by investments not now recoverable.

For these reasons the California defendants believe and urge that their exceptions which they have jointly made to the Report of the Special Master should be approved by this Court, and that the decree to be entered in this case should be in conformity with those exceptions and the views presented in this brief.

Description and Development of the California Projects

Motion To Reopen the Trial for the Taking of Evidence re Depletion of the Colorado River at Lee Ferry by the Upper Basin

and

Statement in Support of Motion Submitted by the California Defendants to the Special Master, August 31, 1960

Tables 1-6

Plates 1-11

DESCRIPTION AND DEVELOPMENT OF THE CALIFORNIA PROJECTS

The Master's Report fails to describe adequately the three California projects which depend upon Colorado River water. Those three projects are:

(1) The Palo Verde Irrigation District (described at Rep. 58-60).

(2) The All-American Canal Project (described at Rep. 36-38) which serves the Yuma Project (Reservation Division) in California (described at Rep. 60-61), the Imperial Irrigation District (described at Rep. 53-55), and the Coachella Valley County Water District (described at Rep. 55-58).

(3) The Metropolitan Water District of Southern California, whose Colorado River Aqueduct serves the cities and districts in the southern California coastal basin (described at Rep. 61-71).

The following description of the California projects and their development demonstrates that these projects have been before Congress continuously from 40 to 75 years and have grown with the full knowledge and, indeed, with the assistance of Congress.

1. The Seven-Party Agreement

On August 18, 1931, pursuant to a request from the

Secretary of the Interior,[1] the defendants, other than the State of California, executed an agreement referred to as the "Seven-Party Agreement," fixing the relative rights and priorities of those defendants in the water available for use in California under the Colorado River Compact and the California Limitation Act.[2] The Division of Water Resources of this state recommended this agreement to the Secretary which was promulgated in general regulations.[3] Article I of the Seven-Party Agreement is incorporated *in haec verba* in every water delivery contract executed with these defendant agencies.[4] That agreement provides in effect the following rights and priorities:

---

[1]Calif. Ex. 1810 (Tr. 12,244).

[2]Ariz. Ex. 27 (Tr. 242).

[3]Calif. Ex. 1811 (Tr. 12,244).

[4]*E.g.*, Palo Verde contract art. 6 (Rep. app. 424-29).

Priority No.[5]	Agency and description	Annual quantity in acre-feet (beneficial consumptive use)
1	Palo Verde Irrigation District—104,500 acres in and adjoining existing district	
2	Yuma Project (California division)—not exceeding 25,000 acres.....[6]	
3	(a) Imperial Irrigation District and lands in Imperial and Coachella Valleys to be served by All-American Canal.....	3,850,000
	(b) Palo Verde Irrigation District—16,000 acres of adjoining mesa....	
4	Metropolitan Water District and/or City of Los Angeles.....	550,000
5	(a) Metropolitan Water District and/or City of Los Angeles.....	550,000
	(b) City and/or County of San Diego	112,000
6	(a) Imperial Irrigation District and lands in Imperial and Coachella Valleys to be served by All-American Canal.....	300,000
	(b) Palo Verde Irrigation District—16,000 acres of adjoining mesa....	
		5,362,000
7	Agricultural use in the Colorado River Basin in California, as designated in Map 23000, U.S. Bureau of Reclamation	All remaining water available for use in California

[5]Priority No. 1 is served by Palo Verde Irrigation District; Nos. 2, 3, 6, and 7 by the All-American Canal; and Nos. 4 and 5 by Metropolitan Water District, in which the Los Angeles and San Diego rights have been consolidated.

[6]No contract has ever been executed with any district within this project pursuant to this agreement. See plate 3 *infra*.

2. Palo Verde Irrigation District, California[7]

Existing project

Palo Verde Irrigation District is located on the west bank of the Colorado River, about 212 miles below Hoover Dam.[1] The diversion works, irrigation distribution system, and protective works of the district consist of the Palo Verde Diversion Dam, 280 miles of canals, 120 miles of drains, 34 miles of levees, and an estimated 450 miles of private ditches.[2] The district contains within its boundaries about 121,000 acres. There are presently more than 72,000 net acres of land in cultivation in the valley proper and approximately 2,000 acres farmed on the lower mesa.[3]

Historical background, development, and water rights

The earliest reported settlement was in 1856 by Thomas H. Blythe who, in the early 1870's, acquired approximately 40,000 acres of "swamp and overflow" land.[4]

The first appropriation of water was made by Blythe who, in 1877, posted and filed for 190,000 miner's inches, or 3,800 c.f.s., to irrigate a projected service area of 186,000 acres in the valley and on the lower mesa.[5] From 1877 to 1883, Blythe constructed a gravity diversion intake (at the site of the present diversion dam) and also constructed 3½ miles of main canals.[6]

During the period from 1877 to 1925, additional no-

tices of appropriation were posted and recorded by Blythe and his associates and successors in interest. The largest was for 300,000 miner's inches (or 6,000 cubic feet per second); another claim was to serve a maximum gross service area of 285,000 acres.[7]

From 1908 to 1925, canals of sufficient capacity to serve approximately all of the lands in the valley proper were constructed.[8] In 1925, the system consisted of the "Blythe Intake," approximately 181 miles of canals, and 34 miles of levees.[9] In addition, the landowners had constructed approximately 185 miles of private canals.[1]

In 1925, the Palo Verde Irrigation District acquired the system, including the intake structure, canals, drains, spillways, levees, rights of way, and all rights existing under the appropriations made by Blythe and his successors in interest.[2]

Within areas in the Palo Verde Irrigation District,[3] 116 patents have been issued for lands entered and patented under the Desert Land Act.[4] These patents were issued on the basis of an express determination, required by the Desert Land Act,[5] of a valid appropriative

right in Colorac River system water acquired pursuant to state law.[6] The district (and its predecessors) has been expressly approved by the General Land Office as the source of water supply for desert land entries.[7]

On February 7, 1933, the district entered into a water delivery contract with the Secretary of the Interior for the delivery of water at or near the "Blythe Intake" for the beneficial consumptive use of waters of the Colorado River on the 120,500 acres of the district's service area,[8] in accord with the Seven-Party Agreement (*supra* p. A3). In 1938, the district filed an application with the State of California to appropriate water of the Colorado River in the quantities set forth in the Seven-Party Water Agreement; the application was filed to supplement Palo Verde's then existing rights and without waiving such rights or claims thereto.[9] Thereafter a permit was issued.[10]

Diversion dam

In 1955, a new diversion dam contract was signed between the United States and the district,[1] and the structure was built. This new diversion dam is of sufficient capacity to divert water for the irrigation of the 120,500 acres in the service area of the Palo Verde Irrigation District.[2]

[2]*Ibid.*; Tr. 8,707 (Tabor).

Investment

From 1908 to 1955, the estimated overall cost of construction of project works was in excess of $31,000,000.[3]

Water requirements

For its full development permitted under the Seven-Party Agreement, Palo Verde Irrigation District would reasonably require beneficial consumptive use of approximately 420,000 acre-feet per annum of Colorado River waters for irrigation, domestic, and incidental uses on a net irrigable area of 105,000 acres in the State of California.[4] Maximum historic consumptive use in evidence

---

[3]Calif. Exs. 361 (Tr. 8,749) and 365 (Tr. 8,774); Tr. 8,773 (Tabor).

[4]The quantity of 420,000 acre-feet per annum is calculated as follows: The Seven-Party Agreement (Ariz. Ex. 27, Tr. 242) accords Palo Verde Irrigation District a first priority for 104,500 acres (gross) in Palo Verde Valley, equivalent to a net irrigable area of 89,000 acres. Tr. 8,772 (Tabor). The reasonable consumptive use rate of 4.0 acre-feet per net irrigated acre is calculated as the average annual rate for the last five years of record, 1951-1955, obtained from Calif. Ex. 356 (Tr. 8,729) by dividing the total consumptive use (including incidental uses) by the net cultivated acreage. The first priority would thus require 356,000 acre-feet. The Seven-Party Agreement also accords Palo Verde Irrigation District a share in the third and sixth priorities for 16,000 acres (net) on the Palo Verde Mesa on a parity with Imperial Irrigation District and Coachella Valley County Water District. At the same consumptive use rate of 4.0 acre-feet per net irrigated acre, this priority would require 64,000 acre-feet.

was 296,000 acre-feet for approximately 74,000 acres in 1957.[5]

3. The All-American Canal Project

Districts served

The All-American Canal diverts at Imperial Dam, 303 miles below Hoover Dam and 22 miles above the upper Mexican boundary.[1] It transports water into the Imperial Valley for the Imperial Irrigation District and into Coachella Valley for the Coachella Valley County Water District.[2] Water is delivered en route to the Reservation Division of the Yuma Reclamation Project in California, the Valley Division of the Yuma Reclamation Project in Arizona, and to Mexico.[3]

The fertile lands within the Salton basin and the Reservation Division are completely dependent upon irrigation, the area being one of the hottest, most arid regions in the United States.[4] Supplied with water, however, the valley lands produce large quantities of varied crops on

---

[5]Total beneficial consumptive use during the year 1955 of 284,320 acre-feet as shown on Calif. Ex. 356, note 4 *supra*, divided by the net cultivated acreage during that year of 70,338 acres (*ibid.*) results in a rate of approximately 4.0 acre-feet. The maximum acreage irrigated was 74,000 acres. Tr. 8,772 (Tabor). This acreage is multiplied by the calculated rate of 4.0 because 1955 is the most recent year for which evidence of beneficial consumptive use within Palo Verde Irrigation District was presented.

a year around basis,[5] and are among the most productive agricultural lands in the United States, in terms of value of production per acre.[6] Imperial Valley is the nation's principal source of a number of winter vegetables,[7] and Coachella Valley is the nation's principal producer of several high value specialty crops.[8]

Historical background

The bringing of water from the Colorado River to irrigate the valley lands was first proposed in the 1850's,[9] and the approval of such a project was given by an act passed by the California Legislature in 1859.[1] Development of Imperial Valley commenced with surveys and plans started in 1892 by the Colorado River Irrigation Company to divert water from the Colorado River at a point which was later the site of Laguna Dam.[2] It followed in general the present route of the All-American Canal except for a portion entering Mexico in order to skirt sand dunes.[3] Congress in 1893 granted a right of way to the company for the canal across lands adjacent to the river in the Yuma Indian Reservation on condition that the company serve lands within the reservation.[4]

The canal route actually chosen headed on the river at Hanlon, a short distance above the international boundary in California, below the confluence of the Gila River and below the point of any diversion for the Yuma

Indian Reservation.[5] The canal as constructed (Alamo Canal) traversed Mexican territory for some 55 miles and then reentered the United States, utilizing for much of the distance an old overflow channel of the Colorado River (the Alamo).[6] This canal and its extensions continued in service until 1942.[7]

Appropriations

Formal appropriations of water under the laws of California for irrigation and power development, each of which was in the amount of 10,000 cubic feet per second of the flow of the Colorado River, were made by the predecessors of Imperial Irrigation District in the period 1893-1899 and succeeding years.[8] These appropriations were subsequently supplemented by permits issued by the State of California to the Imperial and Coachella districts.[9] The area described in these appropriations is that now within the service area of the All-American Canal.

Desert Land Act Patents in Imperial

Within the Imperial Unit of Imperial Irrigation District[1] 2,467 patents have been issued for lands entered and patented under the Desert Land Act.[2] These pat-

ents were issued on the basis of an express determination as required by the Desert Land Act,[3] of a valid appropriative right in Colorado River system water acquired pursuant to state law.[4] Imperial Irrigation District, as well as its predecessors, has been expressly approved by the General Land Office as the source of water supply for desert land entries.[5] The published decisions of the Department of the Interior have approved desert land entries within the boundaries of the district.[6]

Diversions for Imperial Valley

Irrigation commenced in Imperial Valley in June 1901,[7] and has been maintained continuously since that date.[8] The original wooden headgate was replaced in 1906 by a permanent headgate, Hanlon Heading, with a capacity of 10,000 cubic feet per second.[9]

The Corps of Engineers informed the California Development Company predecessor of Imperial Irrigation District, in 1903 that the War Department would not interfere with its operations,[1] and beginning in 1910 is-

sued permits under section 10 of the Rivers and Harbors Act of 1899[1a] authorizing the construction of temporary weirs across the Colorado River for the diversion of waters into the valley.[2]

During this same period, there were several federal investigations of the use of Colorado River water to irrigate this area. From 1901-1903, a joint investigation and report was made by the Department of State, the Attorney General of the United States, the Department of the Interior, the International Boundary Commission, and the Army Engineers of the War Department.[3] It was concluded that diversions for Imperial Valley did not interfere with navigation on the river,[4] and the consulting engineer for the United States Geological Survey, Department of the Interior, reported that it would be a "public calamity" to interfere with this development whereby "1,000,000 acres or more of land may be redeemed by this river by irrigation."[5] The United

[4]*Id.* at 72-73. After reviewing the physical conditions on the river, the report concludes in part (p. 73): "It seems to me a matter of great doubt, in view of these facts, whether under such circumstances, a court could be induced to restrain this company in its operations, unless it was in the interest of some governmental navigation, which might require extraordinary means to an unusual end or unless some serious effort should be made in navigation by parties able and earnest and having real traffic to be handled. . . .

". . . . The Imperial Company has, in part, accomplished, and is expected ultimately to complete, the reclamation of several hundred thousand acres of land, as before stated. It will therefore become a question of policy with the Government whether it should strive to withhold the water altogether or acquiesce by inaction in this company's operations so long as the same are reasonable and not practically injurious to the use of the river for general purposes or inimical to Federal Control."

[5]*Id.* at 41, 56-57, 58.

States Reclamation Service had also conducted investigations, summarized in its 1904-1905 report.[6]

Congress also acted to protect the valley. In 1907, President Roosevelt sent a message to Congress on the subject,[7] as did President Taft in 1910[8] and 1912.[9] Funds were appropriated in 1910 to aid in the work to control the river.[10]

Diversions for Reservation Division

In 1904, Congress authorized the Secretary of the Interior to reclaim lands within the Yuma Indian Reservation "in like manner as though the same were a part of the public domain."[1] In 1905, acting under the Reclamation Act, the federal government made an appropriation of Colorado River waters pursuant to California law for the project and began construction of Laguna

[1]U.S. Ex. 1103 for iden. (§ 25 of the Act of April 21, 1904, 33 Stat. 224, Tr. 13,738). Ten years earlier, Congress had ratified an agreement between the United States and the Yuma Indians whereby the Indians relinquished to the United States all their rights, title, claim, and interest in the original Yuma Indian Reservation, created by an executive order of January 8, 1884 (U.S. Ex. 1101, Tr. 13,737), in return for the right of each of the Indians to select five-acre allotments. With respect to lands not so allotted, the Secretary of the Interior was directed to sell at public auction those which were irrigable, while those lands not susceptible of irrigation were to revert to the public domain. (U.S. Ex. 1102 for iden., § 17 of the Act of Aug. 15, 1894, 28 Stat. 332, Tr. 13,737.) The 1904 legislation reserved and allotted five acres of irrigable land for each Indian belonging to the reservation, the remaining irrigable lands directed to be disposed of to settlers under the provisions of the Reclamation Act.

Dam as a diversion structure.[2] Water was delivered to the Reservation Division from Laguna Dam starting in 1910 and continuously thereafter until completion of Imperial Dam and the All-American Canal.[3]

The 1905 flood

In 1905, river floods broke into the Alamo Canal in Mexico and the entire flow of the Colorado River for a period of approximately two years ran from Lower California into Imperial Valley, threatening the whole valley with destruction, inundating a substantial part of the reclaimed lands, filling the lowest portion of Salton Sink, and creating what is now known as the Salton Sea.[4] The break was successfully repaired in 1907 by a series of man-made dikes and levees.[5] In 1910, Congress appropriated $1,000,000 for the construction of levees to protect the valley.[6]

---

[2]On May 10, 1904, the Secretary of the Interior had authorized the Reservation Division as part of the Yuma Project and the construction of Laguna Dam. Ariz. Ex. 164 (Tr. 2,237). On July 8, 1905, J. B. Lippincott, acting for the United States under the provisions of the Reclamation Act of June 17, 1902, posted a notice of appropriation of 6,000 cubic feet per second of the unappropriated waters of the Colorado River at the California side of the proposed Laguna Dam site, the water to be used for irrigation, domestic, power, mechanical, and other beneficial uses in and upon the lands of the Yuma Valley adjacent to the Colorado River, below the point of diversion situated in San Diego County, California, Calif. Exs. 386 (Tr. 9,949) and 13 (Tr. 7,391). Work on Laguna Dam was begun on July 19, 1905. Tr. 8,833 (Steenbergen).

[3]Approximately 600 acres were irrigated in the vicinity of Bard in 1910 and about 2,500 acres cleared for cultivation. Tr. 8,834 (Steenbergen); Calif. Ex. 374 (Tr. 8,838), p. 3. The irrigated acreage on the project increased regularly, reaching a high of 12,729 acres in 1926, and thereafter fluctuating annually. Calif. Exs. 375 (Tr. 8,841) and 372 (Tr. 8,835), maps 5-8.

[6]Calif. Ex. 151 (Tr. 7,432).

Organization of Imperial Irrigation District

The defendant Imperial Irrigation District, a public agency of the State of California, organized in 1911,[7] succeeded in 1916 to all of the water rights and other property above mentioned.[8] It is now one of the world's largest irrigation districts.

All-American Canal Board

In 1918, the district entered into a contract with the Secretary of the Interior providing for surveys and plans for an all-American canal to Imperial Valley, to divert at Laguna Dam (the "Potholes"), as proposed by the 1893 plans and surveys,[1] and surveys by the United States Reclamation Service in 1904[2] and by the Imperial Irrigation District in 1913.[3] The Secretary appointed a Board of Engineers which made a favorable report, July 22, 1919.[4] The plans and route proposed were substantially the same as those of the present All-American Canal to Imperial and Coachella valleys,[5] except for the All-American's higher point of diversion at Imperial Dam.

Laguna Dam contract

On October 23, 1918, the district acquired by contract with the United States the right to utilize Laguna Dam as a diversion dam, and agreed to construct an all-

American canal from that point into Imperial Valley.[6] For the right to use the Laguna Dam, this district agreed to pay, and has paid the United States—including a small portion later paid by Coachella Valley County Water District and San Diego—the sum of $1,600,000.[7]

Kinkaid Act and "Fall-Davis Report"

In 1920, Congress enacted the "Kinkaid Act" (Act of May 18, 1920, 41 Stat. 600), providing for an investigation by the Secretary of the Interior of lower Colorado River problems.[8] The Secretary submitted a report, "Problems of Imperial Valley and Vicinity," known as the "Fall-Davis Report," to Congress in February 1922.[9] This report recommended that the United States construct a high storage dam, at or near Boulder Canyon on the lower Colorado River, and an all-American canal from Laguna Dam to the Imperial Valley.[10]

Works in existence at date of Boulder Canyon Project Act

As of June 25, 1929 (prior to construction of the All-American Canal), diversion works and a main canal had been constructed with a capacity adequate for the irrigation of 745,000 net irrigable acres of land in Imperial Valley.[1] As of 1932 there were 600,000 acres under canal.[2] The long term natural flow of the Colorado River above the mouth of the Gila River was sufficient to reasonably satisfy the district's diversion requirements

to the extent of 4,000,000 acre-feet per annum without regulation by a storage dam.[3] Constructed canals and laterals in the Reservation Division as of 1929 were capable of supporting 15,700 gross acres.[4]

Imperial repayment contract: 1932 and 1952

On December 1, 1932, Imperial Irrigation District and the United States entered into a contract,[5] under provisions of the Boulder Canyon Project Act, for the construction by the Bureau of Reclamation of the All-American Canal, including a new diversion dam, Imperial Dam, located a few miles upstream from Laguna Dam, providing operation and maintenance of these works by the district, and repayment of the cost thereof to the United States; and for delivery of water to the district from Imperial Dam. The contract also provides that Imperial Irrigation District include within its boundaries certain designated lands in the mesa areas of Imperial Valley so that Government and private lands

---

[3]Calif. Ex. 291 (Tr. 8,263).

[4]Tr. 8,838-39 (Steenbergen). Construction of Laguna Dam, the original diversion facility for the Reservation Division, was begun on July 19, 1905, and was completed March 20, 1909. The work on the Yuma Main Canal from Laguna Dam was initiated in 1909 and was completed in 1912. Tr. 2,257-58 (Steenbergen); Calif. Ex. 374 (Tr. 8,838), pp. 16-22. Work was commenced on the division's distribution system in the fall of 1909, and by 1910 it was completed to a point known as Indian Heading, in the vicinity of Bard. Tr. 8,833-34 (Steenbergen). Construction continued regularly on the entire distribution system until the end of 1915, when it was substantially complete. Tr. 8,835-37 (Steenbergen); Calif. Exs. 372 (Tr. 8,835), maps 1-4; and 374 (Tr. 8,838), pp. 12-24, 27, 32, 37-38.

By 1929, there were approximately 84 miles of canals and laterals on the division, 13½ miles of drains, and 17 miles of levees. Tr. 8,838-39 (Steenbergen). The present distribution system is substantially the same as that existing in 1929, except that some of the canals and levees have been relocated and about 10 additional miles of drains have been constructed. Tr. 8,839-40 (Steenbergen).

[5]See Ariz. Ex. 34, note 1 *supra*.

there located would be served by the canal as contemplated by the district's appropriative rights.[6] Capacity to serve these lands was built into the canal and the district obligated to pay the cost thereof.[7] On March 4, 1952, the district entered into a contract supplementing that of December 1, 1932.[8]

Coachella and San Diego repayment contracts

Defendants City of San Diego and Coachella Valley County Water District (organized as a public agency of the State of California in 1918) entered into contracts in 1933[9] and 1934,[1] respectively, with the United States for capacity in, and repayment based on capacities of, a proportionate part of the cost of the canal and dam and for delivery of water at Imperial Dam.

Construction of the All-American Canal

Construction of the All-American Canal commenced in 1934, and construction of Imperial Dam began in 1936. Water was first delivered through the All-American Canal to defendant Imperial Irrigation District, October 1940.[2] All of the district's water supply has been received through the All-American Canal since February 14, 1942.[3] Up to that time, headworks of Imperial Irri-

gation District were located *below* the confluence of the Gila River with the Colorado, and Imperial diverted Gila River water for use in California when it was available.[4] Water was first delivered through the All-American Canal to Coachella Valley County Water District in 1947.[5] San Diego has never received service therefrom, but receives its water through the Colorado River Aqueduct.[1]

Areas

The areas which could be irrigated from the All-American Canal are greatly in excess of the areas for which water will be available under the Seven-Party Agreement.[2]

Cost

The cost of the All-American Canal, including Imperial Dam, for which the defendants Imperial Irrigation District and Coachella Valley County Water District are obligated to the United States, under repayment contracts, is $38,500,000.[3] This is borne by them, in general, in proportion to the capacities of the sections of the works serving them.[4] In addition, the defendant Coachella Valley County Water District is obligated to the United States in the additional amount of not to exceed $13,500,000, the cost of its distribution system and other

works.[5] San Diego's share of the cost is about $500,000.[6] Capacity for the Yuma Project is charged to the Imperial and Coachella districts, per the terms of the 1932 contract.

Since 1934, Congress has repeatedly appropriated money for the construction of Imperial Dam, the All-American Canal, and the distribution system.[7]

Total investments

The total investment of Imperial Irrigation District, and its municipalities, in works dependent upon the waters of the Colorado River system (including that district's obligations with respect to the All-American Canal) is not less than $62,000,000.[8] These works include more than 1,800 miles of main canals and laterals,[9] nearly 1,400 miles of drainage canals in Imperial Valley,[1] some 130 miles of main canals, and 75 miles of protective river levees in Mexico. In addition, the district has invested $50,000,000 in its power system.[2] The investment of Coachella Valley County Water District incurred in firm contract obligations, totals approximately $27,000,000.[3] The total investment of the United States, the district, its predecessors, and landowners, in all its

---

works, is not less than $80,000,000. As of 1956, both Indian and non-Indian water users[4] on the Reservation Division had paid to the Bureau of Reclamation an accumulated total of $920,000, leaving only $62,000 remaining to be paid on the original repayment obligation to the United States.[5]

Value of agricultural production

The value of the agricultural production of the lands within Imperial Irrigation District amounted to $136,000,000 in 1952, and to about $29,000,000 within the

---

[4]The Bard Irrigation District represents the non-Indian lands in the division. The district has no contract with the Secretary, has no legal powers over project operations, and acts solely as an advisory group to the Bureau of Reclamation, although a contract has been proposed between the Secretary of the Interior and the district to transfer the operation and maintenance of all works in the division to the district. Tr. 8,859-60 (Steenbergen); Calif. Ex. 385 for iden. (Tr. 8,860). The Bureau of Indian Affairs supervises Indian lands in the division. Both Indian and non-Indian lands receive equal treatment in the delivery of water. Tr. 8,819-20A (Steenbergen).

[5]Tr. 8,858-59 (Steenbergen); Calif. Exs. 383 for iden. (Tr. 8,858) and 384 for iden. (Tr. 8,858).

The non-Indian section of the Reservation Division was opened to settlement in January 1910, by a public notice, issued pursuant to the Reclamation Act of 1902, which authorized the acceptance of homestead entries and water right applications. Tr. 8,850 (Steenbergen); Calif. Ex. 377 (Tr. 8,847). The Bureau of Reclamation has approved numerous "water right applications" for lands in the non-Indian section of the project, which in effect establish a water delivery agreement between the individual water users and the United States (Tr. 8,851-54 (Steenbergen)); Calif. Exs. 378-380 (Tr. 8,852), although there is no common water delivery agreement between the water users and the Secretary of the Interior, as is the case with other California water user organizations. When the obligation to repay the apportioned construction cost of the federal diversion and distribution facilities has been satisfied, the water user receives a certificate of full payment and release of lien. Calif. Ex. 382 (Tr. 8,856). Repayment obligations for the Indian lands are handled by the Bureau of Indian Affairs. Tr. 8,820 (Steenbergen).

Coachella Valley County Water District.[6] The total economy of both areas, as well as that within the Reservation Division, is dependent upon the water supply from the Colorado River system through the All-American Canal. All of the cities and towns in Imperial Valley are dependent upon the All-American Canal for their water supply.[7]

Water requirements

a. Yuma Project, Reservation Division, California

For its full development, the Yuma Project, Reservation Division, California, reasonably requires the beneficial consumptive use of approximately 70,500 acre-feet per annum of waters of the Colorado River for irrigation, domestic, and incidental uses on a net irrigable area of 20,100 acres in the State of California.[1] Maximum

---

[6]See Calif. Exs. 265 (Tr. 8,086-87) and 317 (Tr. 8,475-76), table 5.

[7]Tr. 6,476 (Dowd).

[1]The quantity of 70,500 acre-feet is calculated as follows: The gross acreage is 28,000 (Tr. 8,824 (Steenbergen)), reduced by the Seven-Party Agreement (Ariz. Ex. 27 (Tr. 242)) to 25,000. Of this, the irrigable area constitutes 20,110 acres (rounded to 20,100), consisting of 14,610 acres under distribution system in the Reservation Division (Tr. 8,824 (Steenbergen)), plus 5,500 acres in the west end of the reservation and in the so-called "island area" (Tr. 8,826 (Steenbergen)), jurisdiction over which is in dispute between Arizona and California, which can be served by the extension of the present distribution system. Tr. 8,825-27 (Steenbergen). The reasonable consumptive use rate of 3.5 acre-feet per net irrigated acre is computed as the average annual rate for the most recent years of record, 1954-1956, obtained from Calif. Ex. 376 (table: Reservation Division, computed annual consumptive use, Tr. 8,842) by dividing the total consumptive use (including incidental uses) by the net cultivated acreage. The result, 3.53, is rounded to 3.5 This rate is multiplied by the net irrigable area of 20,100 acres to obtain the reasonable beneficial consumptive use requirement for the project of 70,500 acre-feet.

historic beneficial consumptive use in evidence was 44,-500 acre-feet in 1926 on approximately 12,700 acres.[2]

b. Imperial Irrigation District and Coachella Valley County Water District, California: Combined requirements

Imperial Irrigation District and Coachella Valley County Water District are cumulatively restricted by the first six priorities of the Seven-Party Agreement, which makes no allocation between them, to the beneficial consumptive use of 4,150,000 acre-feet per annum, minus the senior allocations therein made to Palo Verde Irrigation District and the Reservation Division of the Yuma Project (which are stated in that agreement in terms of acreage, not acre-feet). The effect of these deductions converted to acre-feet of water (*supra* pp. A7 and A22) is to leave a residue of 3,659,500 acre-feet

[2]Rate of beneficial consumptive use for 1929 (3.5 acre-feet) was taken from Calif. Ex. 376 (Tr. 8,842) by dividing total consumptive use by irrigated acreage, and this rate was applied to the acreage irrigated in 1926 (12,729 acres), the year of maximum acreage as shown in Calif. Ex. 375 (Tr. 8,841). No rate is in evidence for the year 1926, and 1929 is the nearest year to 1926 for which there is evidence of a rate.

per annum[3] for beneficial consumptive use by the Imperial Irrigation District and Coachella Valley County Water District for its full development permitted by the Seven-Party Agreement (300,000 acre-feet is junior under the Seven-Party Agreement to the priorities of The Metropolitan Water District of Southern California). The net irrigable area capable of irrigation by 3,659,500 acre-feet of beneficial consumptive use is 661,000 acres.[4] This area is less than the sum of the

---

[3]The quantity of 3,659,500 acre-feet per annum is calculated as follows, pursuant to the Seven-Party Agreement (Ariz. Ex. 27 (Tr. 242)):

1.	Sum of first three priorities		3,850,000
	Less:		
	First priority, Palo Verde Irrigation District: 89,000 x 4.0 (Calif. Finding 4C:102)	356,000	
	Second priority, Reservation Division: 20,100 x 3.5 (Calif. Finding 4C:104)	70,500	
	Third priority, that portion for 16,000 acres on Palo Verde Mesa: 16,000 x 4.0 (Calif. Finding 4C:102)	64,000	
	Total deduction	490,500	
	Net, under third priority for Imperial and Coachella		3,359,500
2.	Sixth priority, Imperial and Coachella and the above 16,000 acres on Palo Verde Mesa		300,000
			3,659,500

Because the quantity of 3,659,500 acre-feet is a remainder after deducting the above requirements of Palo Verde Irrigation District and the Reservation Division of the Yuma Project, any adjustment in their allocations in the first and second priorities, up or down, inversely affects the quantity available for Imperial and Coachella. Palo Verde's portion of the third priority is not to be deducted in full, because the 16,000 acres there referred to is on equal priority with the acreage to be served in Imperial and Coachella; for simplification, it is tabulated here as a deduction from the supply available for Imperial and Coachella.

[4]See Calif. Finding 4C:106, p. IV-21, for calculation of net acreage.

net irrigable area in Imperial Irrigation District, 745,000 acres,[5] and Coachella Valley County Water District, 137,900 acres,[6] a total of 882,900 acres. The reduction to 661,000 acres reflects the operation of the first six priorities of the Seven-Party Agreement.

Maximum historic acreage, through 1955, irrigated by Imperial Irrigation District was 474,600 acres in 1955,[7] and by Coachella Valley County Water District was 49,400 acres in 1955.[8] Beneficial consumptive use of Colorado River water for those acreages, including domestic and other incidental uses, was 3,662,000 acre-feet in that year.[9]

4. The Metropolitan Water District of Southern California (Colorado River Aqueduct Project)

Description of the project

The Colorado River Aqueduct Project, financed and constructed by The Metropolitan Water District of Southern California (herein referred to as "MWD"), diverts from the main stream of the Colorado River above Parker Dam, 155 miles below Hoover Dam and 175 miles above the Mexican border. The main aqueduct transports water 242 miles westward, and there connects with a distribution system of approximately 304 miles (including the San Diego Aqueduct of approximately 71 miles), which serves the cities and other public bodies which are members of MWD.[1]

---

[5]Calif. Ex. 285 (Tr. 8,220).
[6]Calif. Ex. 318 (Tr. 8,511), table 1.
[7]Calif. Ex. 275 (Tr. 8,210), item 96.
[8]Calif. Ex. 318, note 6 *supra*, table 2.
[9]3,662,000 is the sum of 3,642,000 shown in Calif. Ex. 275, note 7 *supra*, item 70, plus 20,000 shown in Calif. Ex. 279 (Tr. 8,186).
[1]Calif. Ex. 455 (Tr. 9,395), p. 2; Calif. Ex. 457 (Tr. 9,395), p. 17; Ariz. Ex. 1000 (Tr. 211), pp. 18, 20.

The major works of the main aqueduct, large scale construction of which began in 1931 and was completed in 1941, consist of transmission lines, pumping plants, tunnels, canals, covered conduits, inverted syphons, reservoirs, and related works with a designed capacity of 1,605 c.f.s. (cubic feet per second) and an actual capacity of 1,800 c.f.s. The main aqueduct is 242 miles long, including 92 miles of 16-foot tunnels, and 5 pumping plants capable of raising the water 1,617 feet over mountains intervening between the Colorado River and the coastal plain of southern California.[2]

The major works of the distribution system consist of 232 miles of pipeline, tunnels, reservoirs, and related works serving parts of MWD in Los Angeles, Orange, Riverside, and San Bernardino counties, and 71.1 miles of the San Diego Aqueduct (a branch of the Colorado River Aqueduct) serving the parts of MWD in San Diego County.[3] Construction of 150 miles of that part of the system serving Los Angeles and vicinity was completed in 1941, and the balance in 1952.[4] The construction authorized in 1952 to bring the aqueduct system to full capacity was completed in 1960.[5]

The San Diego Aqueduct consists of about 71 miles of conduits, tunnels, and incidental works. Construction of the first barrel of this aqueduct was completed in 1947 and the second barrel in 1954. A third barrel was under construction at the time of trial[6] and was completed in 1960.

Investment

As of November 1956, the total investment by MWD in the Colorado River Aqueduct, including the northern portion of the San Diego Aqueduct and incidental works, was $323,126,531.[7] The completed project required a total investment of about $400,000,000.[8]

The aqueduct system is designed to meet the needs of the expanding population and industry of the coastal plain of southern California at the present rates of growth until about 1970.[9] Prudent practice in the planning and construction of large municipal water supply systems in areas with a history of rapid growth of population and industry requires that the capacity of such works and the firm water supply be sufficient to care for the needs of the population projected so as to avoid disastrous water shortages.[1]

Service area of MWD, population, and assessed valuation

MWD was organized in December 1928,[2] under the authority of the Metropolitan Water District Act.[3] At the time MWD commenced construction of the Colorado River Aqueduct (1931), its corporate area consisted of the area of 13 southern California cities, including 608 square miles;[4] a population of 2,031,000;[5] and as-

sessed valuation of $2,431,684,250.[6] By 1956, the corporate area of MWD had increased through annexations to 2,900 square miles, located west of the coastal range, between Ventura County to the northwest and the Mexican border to the south.[7] As of November 1956, MWD had a population of 6,423,000,[8] and an assessed valuation of $9,674,000,560.[1] By June 30, 1960, the district's population had increased to 7,329,000, assessed valuation to $12,714,206,000, and corporate area to 3,393 square miles.[2]

Within the borders of MWD lie great centers of population, including the cities of Los Angeles, San Diego, Long Beach, and Pasadena, and large areas of unincorporated territory.[3] This is one of the major defense areas of the United States, with military, naval, and marine establishments, aircraft and missile companies, and many other vital industries too varied and numerous to tabulate.[4]

Historical development of the Colorado River Aqueduct project

In 1923, defendant City of Los Angeles surveyed routes and began the design for such an aqueduct,[5] and in 1924 appropriated water therefor, under the laws of California.[6] In 1926, the City of San Diego

---

made appropriations for the same purpose[7] and commenced the design of works.[8] A filing was made by MWD on August 14, 1929.[9] Permits, which in terms supplement MWD's contract rights, were issued by the State of California, dated January 6, 1950, and these permits relate back to the respective dates of applications.[1]

As of June 25, 1929, defendant City of Los Angeles had expended $1,657,822 83 in the design and preliminary construction of the Colorado River Aqueduct.[2] Total spent by the city has been $2,859,678.34. Such preliminary work was later taken over and paid for by MWD.[3] This plan to divert Colorado River water for use on the southern California coastal basin was a major purpose of the Boulder Canyon Project.[4]

Boulder Canyon Project contracts

On September 28, 1931, MWD entered into a contract[5] (amending an earlier contract of April 24, 1930)[6] with the United States, providing for the delivery from

storage at Hoover Dam of water with the priority and quantity set out in items 4 and 5(a) of the Seven-Party Agreement (1,100,000 acre-feet per annum). (*Supra* p. A3.) On February 15, 1933, defendant City of San Diego entered into a contract with the United States, providing for the delivery from storage at Hoover Dam of water with the priority and quantity set out in item 5(b) of the Seven-Party Agreement (112,000 acre-feet per annum); in 1947, both appropriative and contractual rights of the City of San Diego were assigned to and are vested in MWD.[7]

For the purpose of pumping water into and in the Colorado River Aqueduct, as well as assuring to the United States revenues to repay the cost of the Hoover Dam and power plant, MWD also entered into a 50 year contract dated April 26, 1930,[8] to pay for (whether taken or not) 36 per cent of the firm electrical engery output of that project. The MWD water storage and delivery contract of April 24, 1930,[9] and the energy contract of April 26, 1930, were parts of the same transaction. The contract limits the use of this energy to pumping Colorado River water into and in the aqueduct.

Statute conveying right of way

A qualified fee in the public lands traversed by the Colorado River Aqueduct was granted to MWD by

the United States, pursuant to the act of Congress dated June 18, 1932.[1]

Parker Dam

Parker Dam was built at the expense of MWD by the United States[2] under a contract dated February

---

[1]Calif. Ex. 450 (Tr. 9,395).

In reporting on the bill authorizing the grant (Calif. Ex. 451, p. 3, Tr. 9,395), the Committee on Public Lands stated to the House of Representatives that:

"The district has entered into contracts with the Federal Government to purchase power for the purpose of pumping water and for the storage and delivery of water to be impounded in the Boulder Dam. Estimated yearly revenues to the United States from the metropolitan water district under the said contracts are as follows:

Annual obligation for 36 per cent of firm power	$2,488,000
Annual payment for water storage	275,000
Possible revenue from secondary power	500,000
Total	$3,263,000

"The purchase of power by the district is relied upon as a primary source of revenue to repay the Government the expenses of the Boulder Dam project. The bill, therefore, in helping the metropolitan water district also helps the United States Government."

(The figure of $275,000 "annual payment for water storage" is obviously arrived at by multiplying the 1,100,000 acre-feet of water, then under Metropolitan's contract, by 25¢, the agreed price.)

A letter from the Secretary of the Interior to the chairman of the committee is made a part of the report. (Calif. Ex. 451, pp. 3-4, Tr. 9,395.) The Secretary said, in part:

"For your information, the Metropolitan Water District of Southern California is the largest single contractor for Hoover Dam power. All of the electrical energy purchased must be utilized for pumping water into and in an aqueduct from the Colorado River to the coastal plain. This bill provides the necessary right of way for that aqueduct. Inasmuch as a large share of the financial burden of repaying the cost of Hoover Dam is borne by this district, I believe it to be in the interests of the United States to assist the district in the matter of its right of way."

[2]Calif. Ex. 477 (Tr. 9,395), p. 4; Calif. Ex. 483 (Tr. 9,395).

10, 1933,[3] ratified by the Act of August 30, 1935,[4] Parker Dam provides a point of diversion and produces electrical energy for pumping water agreed by the United States to be delivered to MWD from storage at Hoover Dam,[5] under the water delivery contracts referred to above.[6]

Boulder Canyon Project Adjustment Act

In 1940, the Congress adopted the Boulder Canyon Project Adjustment Act,[7] revising the rate structure for energy from Hoover Dam power plant and providing for amortization of the project by funds derived from the sale of electrical energy and from the storage and delivery of water. In the resultant regulations,[8] revenues to be derived from Metropolitan, both for storage and delivery of water and for electrical energy for pumping that water, were relied upon as contributing a substantial part (about one third) of the funds required to amortize the Boulder Project. Full delivery of water under the Metropolitan contract was assumed as was the use of the necessary energy for the pumping of that water.

Integrated plan

The water delivery contracts,[9] electrical energy con-

tract,[1] and contract for the construction of Parker Dam,[2] all were parts of an integrated plan for the delivery, diversion, and pumping of water of the Colorado River for domestic and municipal use on the coastal plain of southern California, with the priority, and in the quantity set out in the Seven-Party Agreement.[3]

San Diego Aqueduct

The first barrel of the San Diego branch of the Colorado River Aqueduct was constructed by the Bureau of Reclamation for the Navy Department under an executive order dated November 29, 1944,[4] and ratified by the Act of April 15, 1948,[5] to meet a shortage of water in a critical defense area.[6] This construction was completed in 1947.[7]

A second barrel of the San Diego Aqueduct was authorized by the Act of October 11, 1951.[8] This construction was completed in 1954.[9]

Investment in San Diego Aqueduct

As of November 30, 1956, the San Diego County Water Authority, of which defendant City of San Diego is a part, had expended $43,308,849 for the San Diego Aqueduct, together with all other costs in con-

nection therewith, to utilize Colorado River water.[1] As of November 30, 1956, the Authority's unpaid obligation to the United States for these costs (less that portion assumed by MWD) was $56,769,439.[2]

As of May 1, 1957, a third barrel of the San Diego Aqueduct (sometimes termed "Second San Diego Aqueduct")[3] was authorized by MWD and San Diego County Water Authority. The northerly portion, 43.5 miles, was financed, constructed, and operated by MWD; the southerly portion, 61.1 miles, was financed, constructed, and operated by the Authority. This construction was completed in 1960 at a cost of $55,000,000, of which MWD will pay $20,000,000 and the Authority will pay $35,000,000.[4]

Financing the project

The first development of the project to August 1, 1941, was financed by the issuance and sale of MWD bonds in the amount of $220,000,000, authorized in 1931, a large part of which initially were sold to the Reconstruction Finance Corporation, an agency of the United States, but were resold by the Reconstruction Finance Corporation, at a profit, to private investors.[5]

Water service

The area served by the Colorado River Aqueduct Project has sustained a phenomenal industrial growth.[6] Many important military installations and defense in-

dustries are located within MWD's service area.[7]

The climate of southern California is extremely arid. Local water supply is limited and variable,[8] and the area is dependent upon a supplemental supply from the Colorado River Aqueduct.[9]

Service of water through the Colorado River Aqueduct Project commenced in June 1941, and has continued since that date.[1] By the year 1970, all water appropriated and contracted for by MWD from the Colorado River (1,212,000 acre-feet per annum) will be required for beneficial use by MWD on the coastal plain of southern California.[2]

Water requirements

For its full development permitted under the Seven-Party Agreement, The Metropolitan Water District of Southern California reasonably will require the beneficial consumptive use of 1,212,000 acre-feet per annum[3] of water of the Colorado River for domestic, municipal, industrial, and incidental uses in southern California.[4] Maximum historic beneficial consumptive use in evidence was 584,000 acre-feet in 1957,[5] which has in-

creased to nearly 900,000 acre-feet in 1960.[6]

5. Miscellaneous Uses in California

In 1957, there were 4,700 acres of improved land along the Colorado River in California located outside any irrigation district or Indian reservation which were using water, but not under notices of appropriation or water delivery contracts;[1] these are riparian lands and may have riparian rights under California law. The occupants of these lands as of 1957 were effecting the beneficial consumptive use of approximately 8,000 acre-feet per annum of waters of the Colorado River system.[2]

There are a number of small towns in the Colorado River basin in California presently using waters of the Colorado River system. Most of them are within existing projects and are served as part of those projects. However, the city of Needles, located on the Colorado River, is not within any project and presently satisfies its requirements by ground water pumping. The city pumped 2,800 acre-feet in fiscal 1958.[3]

---

[6]During the calendar year 1960, MWD's gross diversions from Havasu Lake totaled 894,193 acre-feet. Bureau of Reclamation, U.S. Dep't of the Interior, Region 3, Boulder City, Nevada, *Water Log of the Colorado River, Grand Canyon to International Boundary—For Calendar Year 1960,* col. 4 (provisional records as of Feb. 15, 1961).

During fiscal 1960, 772,813 acre-feet were delivered at the MWD intake. 22 MWD ANN. REP. 15, table 7, col. 5 (1960). Total net deliveries amounted to 734,917 acre-feet. *Id.* at vii and 2, table 3, col. 2.

Motion to Reopen the Trial for the Taking of Evidence re Depletion of the Colorado River at Lee Ferry by the Upper Basin and Statement in Support of Motion*

I.

MOTION

The California Defendants Respectfully Move that the Special Master reopen the trial in this cause for the taking of evidence, both oral and documentary, and the making of findings of fact and conclusions of law, relating to the following matters:

(1) The consumptive use of Colorado River system water in the upper Colorado River basin and the depletion of the flow of the Colorado River at Lee Ferry (a) by existing projects, and (b) by reasonably anticipated developments by about 1990.

(2) The effect of the decree proposed by the Special Master in the Draft Report on the water supply available to existing California projects by 1990, on the basis of (i) the upper basin depletion referred to above, (ii) the construction of a Central Arizona Project with a diversion requirement of at least 1,200,000 acre-feet per annum, in addition to the full requirements of existing Arizona main stream projects, and (iii) development in Nevada which will use all main stream water which may be apportioned to her under the proposed decree.

---

*This Motion, submitted by the California defendants to the Special Master August 31, 1961 is denied by the Master, Rep. 112 n.41.

II.

STATEMENT IN SUPPORT OF MOTION

A. Why Evidence Must Be Taken

The Draft Report proposes a decision which we say will destroy one California project which serves 7,000,000 people in southern California and will drastically curtail our two great agricultural projects. The proposed decision is based on a novel construction of the Boulder Canyon Project Act and the California Limitation Act first announced on May 5, 1960, when the Draft Report was circulated. The Special Master agrees that the decision would be subject to reexamination were he persuaded that the disaster which we see is truly in prospect, but he sees no such prospect.

The Master includes in the lower basin water supply, against which the decree is to be tested, large quantities of unused upper basin water. Availability of this water to the lower basin was not litigated, and the Master's assumptions with respect thereto were not disclosed until the California rebuttal argument on August 19, 1960. The supposed facts on which the Master relies were clearly not in issue on the pleadings and are not found in the record of this case. The Master's determination of those supposed facts is seriously in error.

These positions of the Special Master, contrary to assertions expressed or implied in the Draft Report, are revealed in the transcript of the August 1960 argument in New York City:

1. The water supply of the lower basin can be determined.

2. Determination of water supply may be useful to decision.

3. The Special Master has in fact reached a conclusion that there will be an abundant supply of water for all lower basin projects. This conclusion rests on supposed facts with respect to upper basin development which he has improperly judicially noticed and which are contrary to what the evidence would show had there been reason or opportunity to produce it. Our motion is directed toward the production of that evidence.

We shall consider these points in the order listed.

1. Water Supply Can Be Determined

In the Draft Report, the Special Master states the conviction that "it is impossible to make an estimate of future [water] supply in the Lower Basin within useful limits of accuracy." (DR 103.) The reasons for our profound disagreement with that statement are set forth in our Comments and Suggestions on the Draft Report (pp. 61-90) in connection with our motion for appointment of disinterested experts to determine supply.

The Master now (as of August 17, 1960) apparently agrees that water supply is determinable.[1]

---

[1]"THE MASTER [to Mr. Ely]: I don't want to divert you from your argument, but, after all, we have got a limited time and I might save you some by indicating where my mind is on the subject. If you can persuade me that a finding of [water]

2. Determination of Water Supply Is Useful to Decision

The statement of our reasons why water supply should be determined is contained in our Comments and Suggestions re the Draft Report, pages 68-73.

Further argument appears unnecessary in view of the Master's repeated statements during the New York City argument:

> "I suppose it is true that if a particular determination would lead to a genuine disaster, I suppose we would agree that that would be a good reason for reexamining it to see whether perhaps we did fumble somewheres en route and perhaps the Court ought to so fashion its decree so that disaster should be avoided." [Tr. 22,976.]

> "I naturally am very deeply concerned about any set of facts or arguments which suggest the possibility that the spigots on the Metropolitan Aqueduct will have to be turned shut, and if I believed any such thing I would have strained every legal

---

supply is useful to decision, then although I have indicated it's very difficult, there are lots of findings which are difficult, but, if necessary, are made within such degree of accuracy as can be established within the scope of the testimony available[.] [M]y view of the matter is and has been, subject to being persuaded that I am in error, that it is not useful to decision in this particular conference and that, whereas normally, despite that I might have made a finding, because the Court might take a different view of it, in view of the exceeding difficulty of making it, I will abstain from doing so. Now, that is the position. Therefore, save time in your argument that it is useful for decision rather than it is an ascertainable proposition." [Tr. 22,749-50.]

document to try to prevent that because I adhere to the notion that it is true that some of the authors you quoted the other day—that such projects should not be turned off because some interesting legal conception is valid and it has some property significance along the lines you argued this morning.

"I have not heretofore persuaded myself that such was the fact. Nothing I have heard suggests that such is the fact and nothing persuades me that such is likely to be the fact within the unforeseeable future, not to say foreseeable future." [Tr. 23,092-93.]

3. The Special Master Has Reached Erroneous Conclusions With Respect to Water Supply

The Special Master's declarations with respect to the water supply available to the Metropolitan Water District, although contradicted by declarations in the Draft Report,[2] were emphatic and repeated during California's rebuttal argument in New York City on August 19:

"I am morally certain that neither in my lifetime, nor in your lifetime, nor the lifetime of your children and great-grandchildren will there be an

---

[2]"[T]he evidence indicates that California is already using some of the water claimed by Arizona." (DR 119.) California's use in the latest year of record for each project totals 4,483,885 acre-feet. (DR 115.)

The Master twice quotes (DR 30-31, 118) with apparent approval the Secretary of the Interior's report in 1948 to Con-

inadequate supply of water for the Metropolitan project.

". . . .

"I am morally certain as certain as I am of the multiplication table, that not within the span of the ages indicated there will be any diminution either in the present uses of the Metropolitan Aqueduct or its contemplated expansion." [Tr. 23,084.]

The Special Master is demonstrably wrong.

Implicit in these declarations is a determination that there will be *more than* 5,062,000 acre-feet per annum of consumptive use available for California. California must receive more than 5,062,000 acre-feet if Metropolitan is to receive its contract quantity of 1,212,000 acre-feet per annum. Metropolitan's rights under the Secretary of the Interior's contracts are junior to 3,850,000 acre-feet of agricultural use. We say *"more than* 5,062,000 acre-feet," because of the Indian rights in California to which the Draft Report accords priority ahead of Metropolitan.[3]

---

gress that there will be water for the Central Arizona Project on Arizona's contentions, but not on California's. This report [Ariz. Ex. 71, at 150-51, also designated as Calif. Ex. 7514-F submitted as part of Calif. Offer of Proof dated August 17, 1960] permits California only 4,400,000 acre-feet per annum, less reservoir losses. This determination is based on virgin flow at Lee Ferry (1897-1943) of 16,270,000 acre-feet per annum.

[3]Indian rights in California seem to approximate 33,000 acre-feet per annum of "consumptive use." Calif. Comments re Draft Report, pp. 15 n.9, 16 n.10.

The water supply which must be available to justify the Master's conviction can readily be calculated. If "the spigots on the Metropolitan Aqueduct" are to run full there must be available to Arizona, California, and Nevada for division on the Master's formula a total of more than 8,824,000 acre-feet per annum, divided as follows:

Arizona	3,462,000	acre-feet[4]
California	5,062,000	" "
Nevada	300,000	" "
Total	8,824,000	" "

The flow at Lee Ferry necessary to provide consumptive use of 8,824,000 can be easily estimated by adding (1) 1,500,000 acre-feet per annum for the Mexican Treaty delivery, and (2) the quantity of losses of various kinds, after adjustment for gains below Lee Ferry from inflow to the main stream.

Here is the calculation of the losses and gains testified to by Arizona witness Erickson and California witness Stetson in parallel columns.[5] This testimony is uncontradicted in the record.[6]

---

[4]2,800,000 acre-feet plus 662,000 acre-feet of "excess or surplus," equal to Metropolitan's 662,000 acre-feet of "excess or surplus" required to supply Metropolitan's full contract quantity of 1,212,000 acre-feet.

[5]Losses would in fact be substantially higher with the larger flows required to make 8,462,000 acre-feet of consumptive use available from the "mainstream." Erickson's and Stetson's loss figures apply to flows which will produce around 6,000,000 acre-feet of consumptive use from the "mainstream."

[6]Citations to the record are found in Calif. Finding 5E:102 (11), p. V-29.

	Units—1,000 acre-feet per annum			
	Erickson		Stetson	
Mexican delivery	1,500		1,500	
Losses:				
Evaporation from Lake Mead	700		650	
Uncontrollable spills at Hoover Dam	500		300	
Evaporation from reservoirs, Hoover Dam to Mexican boundary	300		300	
Channel losses, net of channel salvage, Hoover Dam to Mexican boundary	300		600	
Regulatory waste (excess arrivals in limitrophe section)	75		200	
Total losses plus Mexican delivery		3,375		3,550
Gains:				
Net gain, Lee Ferry to Lake Mead	950		950	
Bill Williams and Miscellaneous inflow below Hoover Dam	75		75	
Total gains		1,025		1,025
Flow at Lee Ferry not available for beneficial consumptive use in lower basin		2,350		2,525

The foregoing figures represent the water which passes Lee Ferry which cannot be beneficially consumed in the lower basin. This figure determines the flow which must pass Lee Ferry to meet the Master's expectation of an abundant supply for Metropolitan Water District, necessitating under his formula 8,824,000 acre-feet from the main stream for the three lower division states:

	Units—1,000 acre-feet per annum	
	Erickson	Stetson
Water required for use in Arizona, California, and Nevada from main stream	8,824	8,824
Flow at Lee Ferry not available for beneficial consumptive use in lower basin	2,350	2,525
Lee Ferry flow necessary to meet Master's expectation	11,174	11,349

There can be no basis, either from the record or from facts outside the record, for anticipating future flows at Lee Ferry anywhere approaching 11,200,000 acre-feet per annum, at any time in the future after Glen Canyon Dam is closed in 1962. Yet that is the flow which the uncontradicted evidence shows must be available if the Master's assumption of a full supply for the Metropolitan Aqueduct for the "foreseeable" and "unforeseeable" future is to be realized.

Three errors can be identified in the Special Master's conclusion:

(a) *The Master Improperly Treats Unused Upper Basin Water as Part of the Supply Available to the Lower Basin in Testing the Effect of the Recommended Decree*

The Master's inclusion of unused upper basin water[7] in the lower basin supply was revealed in the following colloquy between California counsel and the bench during the California rebuttal argument in New York City on August 19:

> "Mr. Ely: I think what you said yesterday and today is the key to this whole matter, that if there is a possibility or a probability of disaster attending upon the results of your decree it should be taken into account and you now told us this morning that you see not the slightest chance of that within your lifetime or ours.
>
> "The Master: And in the more distant future.
>
> "Mr. Ely: I think you should say that. I think you should say that in your report.

[7]By the term "unused upper basin water," we mean water which is legally and physically available for use in the upper basin although presently unused in that basin.

"The Master: The post-space age perhaps will drain the moon of its water supply. I don't know and don't pretend to guess.

"Mr. Ely: We are in effect relying upon unused Upper Basin water.

"The Master: It is a factor.

"Mr. Ely: It should not be a factor. That is where we break apart. The Colorado River Compact must be respected. It apportions in perpetuity water in the Upper Basin. It is not the basis of a decree here or the basis of financing great projects.

"The Master: What you are saying is if you had known that in 1933 maybe you wouldn't have spent the money to build it because you wouldn't want to have relied upon it. It was built and is gushing with water today and will continue to gush full of water and it doesn't make any difference whether the water is derived from III(a), III(b), III(c), III(d) or unused Upper Basin water or any other supply because unused Upper Basin water is water that rightfully belongs to the Lower Basin under the Compact." [Tr. 23,086-87.]

The foregoing colloquy reveals that the Master's proposed decision is profoundly influenced by the resolution of an issue not tried—availability to the lower basin of water apportioned in perpetuity to the upper basin by the Colorado River Compact. The suit was brought by Arizona to quiet title to specified quantities of water permanently available to the lower basin under the Colorado River Compact. It was tried on that basis.

In 1948, the Secretary of the Interior, in his report to Congress on the Central Arizona Project, stated:[8]

> "If the contentions of the State of Arizona are correct, there is an ample water supply for this project. If the contentions of California are correct, there will be *no dependable water supply* available from the Colorado River for this diversion." (Emphasis added.)

The Secretary referred to water available to the lower basin under the Colorado River Compact, with the upper basin's apportionment in perpetuity subtracted. This was the issue pleaded, tried, and briefed. A decision on any other basis would not provide an answer to the question posed by the Secretary of the Interior which the parties sought to have litigated in their 1952 and 1953 pleadings, and which they thought they were litigating throughout the trial.

The Special Master addressed himself to the Secretary's question in the argument on August 19, 1960:

> "Let me ask one question which is disturbing me. You remember there was a communication from the Secretary of the Interior to the Congress of the United States, or to one of its committees, wherein he said that the [Central Arizona] project is under certain circumstances feasible. I won't go into the details. He further said if Arizona is right then there is water sufficient to operate such a project.

---

[8]H.R. Doc. No. 136, 81st Cong., 1st Sess. IV (1949), Ariz. Ex. 70, quoted DR 30.

"Did he thereby mean that he would deprive the Metropolitan Water Project of aqueduct water? Is that what the Secretary of the Interior meant? Or did he mean that if the legal availability was such there would be enough water to supply both?" [Tr. 23,091.]

The Master rephrased his question:

"Did he [the Secretary] mean the Metropolitan District would be curtailed in its capacity for further expansion?" [Tr. 23,092.]

The answer to the Special Master's question is found in the Secretary's communication to Congress.[9] The answer is abundantly clear. Under Arizona's then legal contention, the Secretary reported[10] that California would be limited to 4,400,000 acre-feet plus presumably 55,000 acre-feet "under article III(f)."[11] California's right would be reduced by a proportionate share of reservoir losses, or more than half a million acre-feet. In short, the entire Colorado River Aqueduct supply would be destroyed.

---

[9]H.R. Doc. No. 136, 81st Cong., 1st Sess. 151 (1949); reproduced in Calif. Ex. 7514-F for iden., tendered with the August 17, 1960, offer of proof, from Ariz. Ex. 71.

[10]The Secretary's calculation was based on a 16,270,000 acre-foot average annual virgin flow at Lee Ferry—more than 1,000,000 acre-feet larger than any evidence in this case supports. *Id.* at 150.

[11]Line 10 of the table in H.R. Doc. No. 136, note 1 *supra*, shows "total surplus" of 220,000 acre-feet per annum, of which 55,000 acre-feet are allocated to Arizona "under article III(f) of the compact." Under the "excess or surplus" provision of the Limitation Act, California's half would also equal 55,000 acre-feet, although the table does not so state.

(b) *The Special Master Improperly Resorts to Judicial Notice to Determine the Quantities of Unused Upper Basin Water Available to the Lower Basin*

The Master's improper resort to judicial notice was revealed in the following colloquy during the August 19, 1960, rebuttal argument:

> "The Master: There is a provision in the Compact, you know [Article III(e)], that the Upper Basin is not going to withhold water they haven't any use for. Nobody has mentioned that, but it is there. It is as much an obligation of the Upper Basin as III(d).
>
> "Mr. Ely: That is true, your Honor.
>
> "The Master: And I haven't seen any projects which say they are going to use 6½ million acre-feet of water either written, proposed or contemplated.
>
> "Mr. Ely: That is a most important assumption in this lawsuit, if that is the one you are making, your Honor.
>
> "The Master: I am not making an assumption. I said there is nothing in the evidence which indicates any such consumption in the Upper Basin, as you have postulated in the Stetson study.
>
> "Mr. Ely: He wasn't there to do that. His function, as he explained, was to say if the reservoirs are built that have been authorized, how much water will they control, and the residue will come down to the Lower Basin.

"Your Honor, the issue has not been tried as to the rate of expansion in the Upper Basin. We think it is totally irrelevant.[12]

"The Master: No, but there is evidence in the record which shows the maximum consumptive use in the Upper Basin contemplated is not more than four million eight.

"Mr. Ely: I must respectfully differ with you, sir. That is not correct. That issue was not tried. There is in the record one or two pages from a departmental study.

"The Master: If that is not in the record, there is no proof on the subject and there is no proof on it and certainly Mr. Stetson's assumption it will be 6½ million has no rock to sit on." [Tr. 23,081-82.]

The figure of 4,800,000 acre-feet which the Master in the foregoing colloquy described as "the maximum consumptive use in the Upper Basin contemplated" is not in evidence. It is not found in the Draft Report. Its source is the following paragraph from Senate Report No. 128, 84th Congress, 1st Session, on S. 500

---

[12]Compare the following colloquy:

"MR. ELY: Your Honor, how soon the Upper Basin may develop is not tried.

"THE MASTER: In a sense that is true. We did have the historic flows at Lee Ferry, we had the historic flows at Lake Mead. Those we had right down to date, at least down to fairly recent date, and, of course, we could take judicial notice of the [Colorado River Storage Project] statute. I think, in fact, it was offered in evidence in some of the reports, and I have the Stetson estimates and I have the Erickson hypothesis and so forth. To that extent we had some material on the Upper Basin." [Tr. 23,104.]

(a Colorado River Storage Project bill), which the Special Master identified as the basis of his information. [Tr. 23,103.] The Senate committee report states:

> "The Committee concluded that it was satisfactorily established by the evidence that the aggregate of the consumptive use of water that will be made, if all of the works hereby proposed to be authorized are eventually constructed after meeting the various conditions imposed, when added to consumptive use already being made in the upper division States, will amount to less than two-thirds of the apportionment made to the upper basin under the compact. When all storage units and participating projects *named in this bill* are constructed, the aggregate of all consumptive uses in the Upper Basin would not exceed *4.8 million acre-feet of water per annum.* This would leave an unused apportionment of 2.7 million acre-feet of the 7.5 million acre-feet apportioned to the Upper Basin to meet any contingencies arising out of litigation over varying interpretations of the compact. In the circumstances, the continuity of the water supply for the Lower Basin would be assured." (P. 4.) (Emphasis added.)

The facts recited in the above quoted paragraph from Senate Report No. 128 are irrelevant, even assuming judicial notice were proper. The committee addressed itself only to specific elements of upper basin depletion —those occasioned by existing projects together with the works named in S. 500. It did not concern itself with either future non-federal development in the upper basin, or federal development under other legislation.

Furthermore, this opinion of the Senate committee does not constitute a fact which is judicially noticeable. The hydrology on which the Senate committee report is based is not an indisputable fact of common knowledge on which evidence is unnecessary.

Finally, the major error is that the Special Master has conclusively established unlitigated facts by judicial notice, without notice to the parties and without affording them an opportunity for refutation. See *Stasiukevitch v. Nicolls,* 168 F. 2d 474, 479 (1st Cir. 1948). Senate Report No. 128 was called to the Master's attention by California counsel during the trial. [Tr. 12,200.] The Master at that time refused to permit California counsel either to read from the document or to comment upon it. It was not cited or referred to in the proposed findings, conclusions, or briefs of any party.

In this case, by stipulated pretrial order, and for the express purpose of giving parties an opportunity to prevent such an improper or mistaken exercise of judicial notice, the Draft Report was circulated prior to submission of a report to the Court. The ground rules for judicial notice established at the beginning of the trial[13] were restated by the Master at the close of the trial:[14]

---

[13]"THE MASTER: . . . I would be perfectly agreeable to have the [pretrial] order provide, and not leave it to chance, that the Master shall circulate his proposed report before filing, and then if there is an issue about judicial notice there, we can, if necessary, have it briefed or argued orally, take whatever steps the occasion calls for." [Pretrial conference, Tr. 239-40.] Accordingly, an order to circulate a draft report is incorporated in article III-H of the pretrial order.

[14]Tr. 22,375. The statement was made with respect to the Master's exclusion of Calif. Ex. 5588, S. Doc. No. 23, 84th

"The Master: . . . [O]ne of the reasons why we had all agreed that we would circulate a draft report in advance of filing was that, in the event anything was judicially noticed about which the parties might have argument that it should or should not have been judicially noticed, that would be an appropriate time to call attention to it, because it is impossible to forecast what that might be; . . ."

The Draft Report did not advise us that the Master had judicially noticed that upper basin consumptive use would not exceed 4,800,000 acre-feet per annum. That alleged fact is relevant in this suit, if at all, only to lower basin water supply. The Draft Report advised only that the water supply cannot be determined. Not until the rebuttal argument in New York City did the California defendants learn that the Master in fact believes that water is sufficiently abundant that the Colorado River Aqueduct's junior priority will be fully protected, and that the Master's belief is based on judicial notice with respect to a supposed ceiling of 4,800,000 acre-feet per annum of upper basin consumptive use.

(c) *The Supposed Facts Which the Special Master Reveals He Has Judicially Noticed, and Which May Profoundly Influence His Decision, Are Manifestly Wrong*

First, even if 4,800,000 acre-feet per year were established as the maximum upper basin depletion, the conclusion which the Special Master draws therefrom

---

Cong., 1st Sess.: *Report on Depletion of Surface Water Supplies of Colorado West of Continental Divide* (1955) and Calif. Ex. 5588-A, which consists of excerpts therefrom. [Tr. 22,373-74.]

as to available water supply in the lower basin is demonstrably erroneous. The maximum average annual virgin flow at Lee Ferry used in any water supply study in evidence, or asserted by any witness as a basis for water supply calculations, is 15.2 million acre-feet. If the Master's 4.8 million acre-foot ceiling on upper basin depletions be correct, only 10.4 million acre-feet (15.2 minus 4.8) would be available at Lee Ferry for all consumptive use from the main stream, for net main stream losses, and for deliveries to Mexico. This quantity of water is 774,000 acre-feet per year less than 11,174,000 acre-feet, the smallest estimate (based on Erickson's losses) of the minimum Lee Ferry flow that must be available to support the consumptive use which the Master is convinced will be available to the lower basin.

To put it another way, a depletion of 4,800,000 acre-feet in the upper basin, added to the 11,174,000 acre-feet annual average that the Master necessarily supposes will flow at Lee Ferry, requires an average annual undepleted flow of 15,974,000 acre-feet per year, assuming Erickson's losses. Using Stetson's losses, the average annual undepleted Lee Ferry flow would have to be 16,149,000 acre-feet. This is larger than any longtime average figure for undepleted or virgin flow used by any witness. Furthermore, the Secretary of the Interior, to whom the Master would entrust the operation of the river, has recently based his calculations on the 1922-1957 period.[15] The virgin or undepleted flow

---

[15]See S. Doc. No. 84, 86th Cong., 2d Sess. (1959), Colorado River Storage Project: A Memorandum and Statement of the Secretary of the Interior Transmitting the Proposed General Principles To Govern, and Operating Criteria for, Glen Canyon and Lake Mead During the Glen Canyon Filling Period, p. xi.

for this period was about 14,200,000 acre-feet per annum average.

Second, the Draft Report reveals that historically, long before the passage of the Colorado River Storage Project Act, Lee Ferry flows were several million acre-feet per year smaller than the quantity the Special Master has apparently assumed to be available now and in the foreseeable and unforeseeable future. For example, the historic flow at Lee Ferry from 1929 through 1958 totaled 355,417,100 acre-feet (DR 102), an average of approximately 11,850,000 acre-feet per year. This quantity leaves an average annual margin of only 676,000 acre-feet per year for increased upper basin depletions over the 11,174,000 acre-feet per annum described above as the flow required at Lee Ferry. This margin is less than the 691,000 acre-feet average annual reservoir evaporation from the four Colorado River Storage Project reservoirs.[16]

Third, on the basis of the increased upper basin uses assumed by the Special Master and the historic flows as set forth in the Draft Report, it can be proved that there is no water supply from the upper basin for the Metropolitan Water District. The Master recognizes a total upper basin depletion of 4,800,000 acre-feet per annum. This is an increase of 2,900,000 acre-feet per annum over the average annual depletion of 1.9 million acre-feet for the period 1912-1957.[17] Deducting this 2,900,000 acre-feet increase in depletion from the 11,850,000 acre-feet per year of Lee Ferry flow, 1929-1958, set forth above, leaves 8,950,000 acre-feet per annum average at Lee Ferry in a future 30-year

---

[16]S. Doc. No. 101, 85th Cong., 2d Sess., p. 13.
[17]Hill, Tr. 21,751, 21,754.

period of equal runoff. Deducting the Mexican delivery and the minimum (Erickson) net losses of 2,350,000 acre-feet from this future Lee Ferry flow, the quantity available from the main stream for consumptive use among the three lower division states is 6,600,000 acre-feet per year. Under the Master's formula, California would receive 44/75 of this quantity or 3,872,000 acre-feet. This will supply the California Indians and almost all of the first three agricultural priorities, but there would be no water for the Metropolitan Water District.

B. What Our Evidence Will Prove

We submit the following statement of what our evidence will prove with respect to depletion of the Colorado River at Lee Ferry by projects in the upper basin, and the effect on the water supply of the Metropolitan Water District under the decree proposed in the Draft Report:

1. Existing projects in the upper basin will permanently deplete the flow of the river by approximately 2.55 million acre-feet per annum by 1963.

2. Upper basin projects under construction or now authorized will deplete the flow of the river by about an additional 1.29 million acre-feet per annum between 1963 and 1970, making a total permanent depletion when added to that specified in paragraph 1 of 3.84 million acre-feet per annum by 1970.

3. Upper basin projects pending authorization will deplete the flow of the river by about an additional 1.60 million acre-feet per annum, making a total permanent depletion when added to that specified in paragraphs 1 and 2 of 5.44 million acre-feet per annum by 1980.

4. There is a high degree of probability that additional federal and non-federal upper basin projects, not taken into account in the preceding three paragraphs, will deplete the flow of the river by about an additional 0.75 million acre-feet per annum, bringing the total permanent depletion at Lee Ferry to 6.19 million acre-feet per annum by 1990.

5. There are potential projects in the upper basin which, together with the projects referred to above, could deplete the Lee Ferry flow by a total of more than 9 million acre-feet per annum[18] by the end of this century if the water were both legally and physically available to sustain such use. Economic development and population growth taking place in the upper basin states will bring about this demand for water.

6. In addition to the permanent depletions of the flow at Lee Ferry, referred to in the preceding paragraphs, substantial temporary depletions will occur beginning in 1962 by reason of the initial filling of the four reservoirs authorized by the Colorado River Storage Project Act.[19] These reservoirs have a combined capacity of 34.7 million acre-feet,[20] and the three largest are already well under construction. There will be further temporary filling depletions as other reservoirs are added.

7. Assuming (1) the upper basin depletions of 6.19 million acre-feet per year described above, (2) construction of the proposed Central Arizona Project with a di-

---

[18]See H.R. Doc. No. 419, 80th Cong., 1st Sess. 107-51 (1947).
[19]70 Stat. 105 (1956), 43 U.S.C. § 620 (1958).
[20]S. Doc. No. 101, 85th Cong., 2d Sess. 3 (1958).

version requirement of at least 1.2 million acre-feet per annum[21] in addition to the full requirements of existing Arizona projects using main stream water, and (3) developments in Nevada which will use all main stream water available to her under the proposed decree: The Metropolitan Water District's Colorado River Aqueduct would be deprived of its entire water supply by 1990 under the decree proposed in the Draft Report.

Only brief comment is necessary upon the evidence which will prove the foregoing. The upper basin states will undoubtedly use all the water legally and physically available to them. There is no basis for the Special Master's apparent assumption that they will not. The only points upon which there can be any difference of opinion among qualified experts are (a) the rate at which upper basin developments will proceed and (b) the date when their full supply will be put to use.

As to quantities, the evidence which we shall offer conforms substantially to the 1958 estimates of the Bureau of Reclamation contained in Senate Document No. 101, 85th Congress, 2d Session 13 (1958), that depletion by the upper basin will reach 6.19 million acre-feet, exclusive of reservoir filling.

As to the rate of development, we point out that the policy of Congress to initiate the comprehensive development of the water resources of the upper Colorado River basin to permit it to use its apportionment under the Colorado River Compact has been declared by the Colorado River Storage Project Act of 1956.[22] That act also provides the mechanism for aid in financing

[21] See H.R. Doc. No. 136, 81st Cong., 1st Sess. 153 (1949).
[22] 70 Stat. 105 (1956), 43 U.S.C. § 620 (1958).

that development by revenues from generation and sale of hydroelectric power.

The Bureau's projected rate of upper basin development after 1970 set forth in Senate Document No. 101 has already proved to be too slow. In 1958, the Bureau of Reclamation scheduled all storage units of the Colorado River Storage Project and all of its initial participating projects except for a portion of the Central Utah Project (initial phase) for completion between 1963 and 1975.[23] Substantial construction funds have already been appropriated for all four storage units and for six of ten participating projects. Furthermore, the construction schedule set forth in Senate Document No. 101 has already been advanced for most of these projects, and by as much as five years.[24]

C. Conclusion

If the facts were as the Master pictured them on August 19 in the New York City argument, there would be no reason for a decision by the Court. Arizona would be entitled to a decree which frees the tributaries and gives her (if Metropolitan is indeed to have a full supply) more water than she has ever sought from the main stream. California would also receive more water than California sought from the dependable supply in the decree we proposed. It is impossible, on these facts, to find a justiciable case or controversy.

It is apparent that the Special Master has made a major error in overstating the water supply. The con-

---

[24]See *Hearings on Public Works Appropriations for 1961 Before the Subcommittee of the House Committee on Appropriations*, 86th Cong., 2d Sess. 481-548 (1960).

sequences of that error are even more serious than the same error of the Compact negotiators in 1922. The life of existing projects is now at stake. The Compact negotiators did the best they could with a short and inaccurate record. The Court today is not similarly handicapped.

However, unless the Draft Report is corrected, the decision will be made without adequate consideration of the facts. The Master concedes that if he took a different view of the water supply, he might take a different view of the law. The same may well be true of the Court. However, the Court must look to the Master's findings in the first instance, and from those findings as they stand in the Draft Report, the Court will learn nothing at all of water supply or the consequences of its decision.

Were this suit a controversy among water users in any of the five litigant states, the Court would inform itself of the facts with respect to water supply[25] and would be aware of the consequences of decision. The sovereign states before this Court are entitled to at least as much consideration.

Dated: August 31, 1960.

[1]Includes 12½ percent bank storage plus 2,620,000 acre-feet dead storage. Assumes 1,000,000 acre-feet of sediment deposition between 1970 and 2020.

*This table is a reproduction of columns 1, 16, 17, 18, 19, and 20 from table 7, p. 12, of Bureau of Reclamation, Regional Office, Region 4, U.S. Dep't of the Interior, *Financial and Power Rate Analysis—Colorado River Storage Project and Participating Projects* (September 1960).

TABLE 6

CALCULATION OF FUTURE USABLE LOWER BASIN WATER SUPPLY
BASED ON 1960 BUREAU OF RECLAMATION PROJECTION*

CALCULATION OF THE FUTURE WATER SUPPY AVAILABLE TO METROPOLITAN WATER DISTRICT UNDER MASTER'S RECOMMENDED DECREE
(Acre-Feet)

		Year 1975	Year 2020
Release from Hoover Dam		9,800,000	8,500,000
Deduction for downstream requirements:			
Evaporation from Lakes Mohave and Havasu	300,000		
Natural river losses	600,000		
Regulatory waste	200,000		
Mexican Treaty obligation	1,500,000		
Subtotal	2,600,000		
Usable inflow	75,000		
Net deductions		2,525,000	2,525,000
Available for consumptive use in Arizona and California		7,275,000	5,975,000
Nevada entitlement from above Hoover Dam[1]		300,000	250,000
Total "mainstream" supply for allocation		7,575,000	6,225,000
California's share		4,438,000	3,652,000
To California users with rights senior to Metropolitan Water District (including Indian reservations)		3,900,000	3,900,000
To Metropolitan Water District		538,000	(− 248,000)

[1]Part of Nevada's main stream use is below Hoover Dam, but it is assumed for purposes of this table that all of Nevada's use is pumped from the reservoir above the dam. Because some of Nevada's uses are from the river below Hoover Dam the water available to California is less than here shown.

CALCULATION OF THE YEAR IN WHICH METROPOLITAN WATER DISTRICT WILL RECEIVE NO WATER UNDER MASTER'S RECOMMENDED DECREE

	Acre-Feet
Main stream supply in 1975	7,575,000
Main stream supply in 2020	6,225,000
Decrease in main stream supply over 45-year period	1,350,000
Annual rate of decrease (1,350,000 acre-feet ÷ 45 years)	30,000
Quantity of California rights (including Indian reservations) which are senior to Metropolitan Water District	3,900,000
Quantity from main stream necessary to satisfy California's right to 3,900,000 acre-feet	6,650,000
Difference between 1975 main stream supply (7,575,000) and quantity necessary to satisfy California rights senior to Metropolitan (6,650,000)	925,000
Number of years after 1975 during which decrease in main stream supply will amount to 925,000 acre-feet (925,000 ÷ 30,000)	31 years
The year in which there would be no supply for Metropolitan, 1975 plus 31 years equals	Year 2006

U. S. B. R. Central Arizona Project Planning Reports (1945-1947)

Congressional Record Vol. 68 Part 4 p. 4431, 69th Cong. 2d Sess. (1927)

SOURCES:

[1]Not shown are noncontract uses by trespassers on federal lands, by owners of private lands not within organized irrigation districts or federal reservations, and by national wildlife refuges.

[2]Tr. 22,368-69; ground water adjacent to the Colorado River pumped since early 1880's.

[3]Ariz. Exs. 38 (Tr. 251), 39 (Tr. 252), and 40 (Tr. 252). See also Ariz. Ex. 41 (Tr. 253), contract of Oct. 4, 1946, merging rights of San Diego under her contract (Ariz. Ex. 40) with rights of Metropolitan Water District under her contract (Ariz. Ex. 38 as amended by Ariz. Ex. 39).

[4]Ariz. Ex. 33 (Tr. 249).

[5]Ariz. Ex. 34 (Tr. 249), Coachella lands included within Imperial contract; Ariz. Ex. 36 (Tr. 250).

[6]Ariz. Ex. 34 (Tr. 249).

[7]The Bard Irrigation District (Tr. 8,819-20; Calif. Ex. 50 (Tr. 6,898)) has no contract. Individual water users hold water right applications which, on Secretarial approval, become contracts; exemplary contracts are Calif. Exs. 378-380 (Tr. 8,852), dated 1917, 1910, and 1948. See Calif. Ex. 381 (Tr. 8,855).

[8]These Indian lands do not require contracts. Rep. 312 n.3a.

[9]*Ibid.*

[10]Ariz. Ex. 93 (Tr. 359).

[11]From at least 1918 until 1953, this project was served under a water delivery contract between the United States and the North Gila Valley Irrigation District. Ariz. Ex. 91 (Tr. 356). In 1953 the same parties executed a supplemental contract under which present deliveries are made. Ariz. Ex. 95 (Tr. 360).

[12]Area is irrigated by private pumping without contracts and by holders of Warren Act contracts (see note 14 *infra*). (Rep. 53; Tr. 2,209-10; Ariz. Exs. 76 (Tr. 318), table 2; 77B (Tr. 3,992), at 43 (area A-7-C); and 79 (Tr. 327), at 6.) The United States is planning to enter into a contract with the Yuma Irrigation District for this area. Rep. 213.

[13]Ariz. Ex. 96 (Tr. 361); deliveries of water started in 1943 (Ariz. Ex. 186 (Tr. 2,361)).

[14]Part of Ariz. Ex. 165 (Tr. 2,247); tabulated in Ariz. Ex. 163 (Tr. 2,223); Warren Act is 36 Stat. 925 (1911), 43 U.S.C. §§ 523-25 (1958).

[15]Part of Ariz. Ex. 165 (Tr. 2,247); tabulated in Ariz. Ex. 163 (Tr. 2,223); Miscellaneous Special Use Act is 41 Stat. 451 (1920), 43 U.S.C. § 521 (1958).

[16]Ariz. Ex. 94 (Tr. 359) as amended by U.S. Ex. 7 (Tr. 15,383-84).

[17]Calif. Ex. 7611 for iden. (See also contracts No. 158r-303 and 304 tabulated in Ariz. Ex. 163 (Tr. 2,223), at sheet 2.) Use of Colorado River water began in 1893. Tr. 19,897-900, 19,901; Ariz. Ex. 316A (Tr. 19,980).

[18]From 1906 until 1951, this project was served under a water delivery contract between the United States and the Yuma County Water Users' Ass'n. U.S. Ex. 19-T (Tr. 15,518). In 1951 the same parties executed a supplemental contract under which present deliveries are made. Ariz. Ex. 92 (Tr. 357).

COMPUTATION OF DEPENDABLE SUPPLY

(Explanation accompanying plate 7, schematic diagram, and plate 8, bar graph.)

The following table (in millions of acre-feet per annum) presents data which are illustrated on plates 7 and 8. The numbered items in the table correspond to the circled numbers on the two plates.

Column 1 shows the calculation of the dependable supply by Mr. Stetson for California (Rep. 110-13). It is illustrated on plate 7, a schematic diagram. It is explained in detail in California Findings and Conclusions, part V, pp. V-3 through 33.

Columns 2, 3, and 4 show the calculations of the dependable supply by Mr. Erickson for Arizona (Rep. 110-13).

The comparison of the figures in columns 1, 2, 3, and 4 is shown graphically on plate 8.

The period for all four studies is 1909-1956. The studies presented in columns (1) and (2) are based on all existing and authorized upper basin storage, equivalent to 25 million acre-feet of effective storage capacity at Lee Ferry. (See Tr. 11,721-22.) The Erickson studies presented in columns (3) and (4) raise this effective capacity to 35 million acre-feet. Column (4) assumes upper division delivery at Lee Ferry of an average of 1,280,000 acre-feet of controlled release for the Mexican Treaty obligation. (Ariz. Ex. 358 (Tr. 18,097); see pp. 245-46 and note 4 *supra*.)

(Table on following page.)

(See explanatory note on preceding page.)

Item	Stetson[1] (1)	Erickson[2] (2)	Erickson[3] (3)	Erickson[4] (4)
1. "Virgin flow" Colorado River at Lee Ferry	15.2	15.2	15.2	15.2
2. Upper basin depletion at Lee Ferry	6.5	6.8	7.2	6.2
3. Total inflow to lower basin at Lee Ferry (1 minus 2)	8.7	8.4	8.0	9.0
4. Net gain Lee Ferry to Hoover Dam	0.95	0.95	1.0	0.95
5. Lake Mead evaporation	0.65	0.7	0.6	0.45
6. Regulated release from Hoover Dam (3 plus 4 minus 5)	8.7	8.2	8.4	9.5
7. Reservoir evaporation Hoover Dam to upper Mexican boundary	0.3	0.3	0.3	0.3
8. Usable inflow Hoover Dam to upper Mexican boundary	0.075	0.075	0.075	0.075
9. Natural river losses Hoover Dam to upper Mexican boundary	0.6	0.3	0.3	0.3
10. Mexican Water Treaty	1.5	1.5	1.5	1.5
11. Water to Mexico in excess of treaty requirement	0.2	0.075	0.075	0.075
12. Unusable spill from Hoover Dam	0.3	0.5	0	0
13. Net usable supply for lower basin from main stream (6 plus 8 minus 7, 9, 10, 11, and 12)	6.175	6.1	6.3	7.4

[1]Calif. Exs. 2216 and 2216A (Tr. 11,825), as corrected at Tr. 21,836.

[2]Tr. 18,913-15.

[3]Tr. 18,812-19. Due to an apparent arithmetical mistake, the witness erroneously stated that the net usable supply on the basis of this study would be 6.5 million acre-feet per annum.

[4]Ariz. Ex. 366 (Tr. 18,097).

Special Master's Report	1
Jurisdiction	1
Questions presented	1
Statutes and compact involved	2
Statement	2
Summary of argument	3
Argument	6
Points I and II. In making allocations of waters from Lake Mead among Lower Colorado River Basin States, the Secretary of the Interior is authorized to make deductions to compensate for upstream consumptive use in Arizona and Nevada of water which would otherwise flow into Lake Mead	7
Point III. Relative rights intrastate to the delivery of Colorado River waters, in terms of quantity and priority, are governed by the terms of the delivery contracts made under authority of the Project Act and by applicable federal law rather than by State law	21
A. The statements in the Report and the provision of the recommended decree respecting applicability of State law to the determination of relative rights intrastate to use the Boulder Canyon Project waters are unnecessary to the recommended decision and should be eliminated	23
B. By Section 5 and other provisions of the Boulder Canyon Project Act the Secretary of the Interior is given broad powers in the administration and disposition of the project water supply, including the power, by contract with water users, to make all appropriate provisions respecting quantities of water to be delivered to different users and the conditions on and under which deliveries will be made	24

595243—61——1

Argument—Continued
Point III—Continued
C. Section 18 of the Project Act does not limit the broad authority conferred on the Secretary of the Interior by Sections 1 and 5 to operate the Boulder Canyon Project and to contract for storage and delivery of the project water supply ..... Page 34
Point IV. The Nevada water delivery contract does not exhaust the authority of the Secretary of the Interior under Section 5 of the Boulder Canyon Project Act to contract further for the use of impounded water within the State of Nevada or to apply unused water to use on federal projects 48
Point V. The United States is entitled to use on its wildlife refuges waters salvaged in development of the refuge areas without regard to priorities established by creation of the refuges 51
Conclusion 53

OCTOBER TERM, 1960

No. 9 ORIGINAL

STATE OF ARIZONA, COMPLAINANT

v.

STATE OF CALIFORNIA, ET AL.

BRIEF IN SUPPORT OF EXCEPTIONS OF THE UNITED STATES, INTERVENER, TO THE SPECIAL MASTER'S REPORT AND RECOMMENDED DECREE

SPECIAL MASTER'S REPORT

The report of the Special Master dated December 5, 1960, was received and ordered filed by this Court on January 16, 1961 (364 U.S. 940).

JURISDICTION

This is an original case in which the jurisdiction of this Court rests on Article III, Section 2, of the Constitution.

QUESTIONS PRESENTED

1. Whether in making contracts with the States in the Lower Colorado River Basin for the storage of water in, and the delivery of water from, Lake Mead the Secretary of the Interior is authorized to make deductions for upstream consumptive use in Arizona

and Nevada of water which would otherwise flow into Lake Mead.

2. Whether the Secretary of the Interior may deliver water pursuant to contracts under the authority of the Boulder Canyon Project Act without regard for State law.

3. Whether the contract entered into by the Secretary of the Interior with the State of Nevada exhausts his authority under Section 5 of the Boulder Canyon Project Act so that he may not contract further for the use of impounded water within the State of Nevada or use such water for federal projects.

4. Whether water salvaged on wildlife refuges may be used there without regard to priorities otherwise applicable.

STATUTES AND COMPACT INVOLVED

The relevant statutes are the Boulder Canyon Project Act, 45 Stat. 1057, 43 U.S.C. 617; the California Limitation Act, Act of March 4, 1929, Ch. 16, 48th Sess., Statutes and Amendments to the Codes, 1929, pp. 38–39, both of which are set forth in appendices to the Special Master's Report at pp. 379 and 397, respectively. Also involved is the Colorado River Compact signed at Santa Fe, New Mexico, November 24, 1922, set forth in an appendix to the Special Master's Report beginning at p. 371.

STATEMENT

This litigation was commenced by Arizona in 1952 by a bill of complaint against California and seven of its agencies, asking for an adjudication of Arizona's rights to the use of the waters of the Colorado

River. The United States, Nevada, New Mexico, and Utah became parties either by intervention or by order of this Court (344 U.S. 919; 347 U.S. 985; 350 U.S. 114, rehearing denied, 350 U.S. 955). The present Special Master was appointed on October 10, 1955 (350 U.S. 812). After pre-trial proceedings, extensive hearings were conducted, briefs were exchanged, a draft report was submitted and commented on both in writing and at oral argument, and the present report was filed. All of the parties except Utah filed exceptions to this report in February, 1961, and it is the consideration of these exceptions which is now before this Court.

SUMMARY OF ARGUMENT

A. Our first two exceptions, which are here treated together, concern the question of whether Arizona and Nevada are to be charged with consumptive use of water upstream from Lake Mead, or whether their full allocations may be taken from Lake Mead and from the mainstream below without regard to the extent that they may have lessened the amount of water flowing into Lake Mead. It is the position of the United States that the authority of the Secretary of the Interior under Section 5 of the Boulder Canyon Project Act to contract for the storage and delivery of water includes the authority to make appropriate adjustments for upstream use. The Special Master rejected this position, holding that the only power of physical control, and therefore the only authority to contract, existed with respect to the water in Lake Mead and the mainstream below Lake Mead.

The provisions of the Boulder Canyon Project Act, when read in the light of its history, indicate an intent to authorize the Secretary of the Interior to divide the mainstream waters available in the Lower Basin. Hoover Dam was constructed to impound and regulate those waters. This purpose would be impaired by permitting Arizona and Nevada to make diversions upstream without a corresponding reduction in their entitlements to stored water.

The Special Master's rejection of this proposition rests in part on a theory that to make adjustments for upstream uses would impair the permanency of the Secretary's contracts in violation of the Project Act and also in violation of State law. But, as the United States understands the effect of making such deductions for upstream use, existing contract rights would not be curtailed. Either the upstream uses would be subject to prior contract, or, if they are prior, would result in authority to the Secretary to limit the quantity of water to be allocated by contract to less than the full amount. In either event, no existing contracts would lose their required permanency.

We believe that this interpretation gives added certainty to the allocations under the Project Act and would give some protection to California's established projects.

B. Our third exception relates to the extent that Congress has subjected the authority of the Secretary of the Interior under the Boulder Canyon Project Act to State law. Although the Special Master refused to pass upon the legality of rights of the United States to make deliveries under contracts it has made,

he did include in his findings a statement that rights under those contracts would be subject to internal State law. This position is also reflected in his recommended decree. We urge that these conclusions should be disapproved.

As we read the Project Act, the Secretary is given full authority to build a dam, store mainstream water, and deliver it to users under contracts to be executed by him. We believe that this affirmative authority is not limited by a requirement that he comply with State law. This is in accord with general principles under which the United States may perform its functions without regulation by the States. It is also in accord with decisions of this Court with respect to the authority granted the federal government in comparable statutes dealing with the use of water where it has been held that control of the operation of these federal projects shall rest entirely in the Secretary. And it is in accord with 59 years of administrative practice under the reclamation laws.

The countervailing argument is that by Section 18 of the Project Act Congress subjected the authority of the Secretary to State law. Both the legislative history of this section and the interpretation of comparable provisions of the Reclamation Act and the Federal Power Act indicate that Section 18 does not mean what the Special Master believed.

C. Our fourth exception takes issue with a single sentence in the Special Master's report in which he held that the Nevada contract, unlike the Arizona contract, contemplated that the State should subdivide the allocation among users. Our position is that Sec-

tion 5 of the Project Act requires that deliveries from Lake Mead be made to users only pursuant to contracts with the Secretary of the Interior. Insofar as the contract with Nevada contemplates use by Nevada, it may fulfill the requirements of Section 5. With respect to other users, we urge that the language of the Nevada contract does not show an intent to depart from the procedure required by Section 5 of the Project Act and followed in Arizona and California.

D. Finally, we excepted to the failure of the Special Master to recognize the right of the United States to use on its wildlife refuges water reclaimed by federal work on those refuges. Our position here is simply predicated on the theory that he who reclaims water may use it.

ARGUMENT

In large part the United States supports the Special Master's Report as filed. However, we have filed five numbered exceptions which deal with specific sections of the report and the recommended decree. Although the fundamental conclusions in the report and major provisions of the decree do not depend upon the resolution of these issues, they are sufficiently significant to make it appropriate to have noted the exceptions and to file this brief in support of them. However, we anticipate that our answering brief in response to the exceptions of the other parties will deal more directly with the principal issues in the case on which we support the report.

Since our Exceptions I and II are closely related, we shall combine our argument in support of them

under a single heading, but will continue to number the points here to correspond with the numbers given the exceptions.

POINTS I and II

IN MAKING ALLOCATIONS OF WATERS FROM LAKE MEAD AMONG LOWER COLORADO RIVER BASIN STATES, THE SECRETARY OF THE INTERIOR IS AUTHORIZED TO MAKE DEDUCTIONS TO COMPENSATE FOR UPSTREAM CONSUMPTIVE USE IN ARIZONA AND NEVADA OF WATER WHICH WOULD OTHERWISE FLOW INTO LAKE MEAD

Our Exceptions I and II are specifically addressed to the Special Master's definition of the term "mainstream" as excluding water above Lake Mead (Report, pp. 173, 183, 185, 225, 226, 316–321; Recommended Decree, p. 345) and to his disapproval of provisions in contracts between the Secretary of the Interior and the States of Arizona and Nevada which condition the amount of water to be delivered thereunder on the amount of depletion of the flow into Lake Mead by upstream uses in these States (Report, pp. 237–247, 226–228).[1]

---

[1] Article 7(d) of the Arizona contract provides as follows:

"The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead, and such obligation shall be subject to such reduction on account of evaporation, reservoir and river losses, as may be required to render this contract in conformity with said compact and said act." (Report, p. 401, App. 5.)

Article 5(a) of the amended Nevada contract contains this language:

"Subject to the availability thereof for use in Nevada under the provisions of the Colorado River Compact and the Boulder

In broad terms, the issue on both of these exceptions is whether the Special Master was correct in construing the authority of the Secretary of the Interior as limited to water to be taken from Lake Mead or from the mainstream below Lake Mead without consideration of upstream uses. We urge that the Boulder Canyon Project Act authorizes the Secretary of the Interior to take into consideration all consumptive use of water in Arizona and Nevada which would have flowed into Lake Mead if it had not been used within the Lower Basin.

A brief discussion of the geography involved is necessary to understand these exceptions. For the convenience of the Court a slightly altered copy of the map which California attached to its exceptions is attached as an appendix. The dividing line between the Upper and Lower Colorado River Basins is located at Lee Ferry, near the northern boundary of Arizona. From there, the river flows for 275 miles before it reaches the upper limits of Lake Mead, the reservoir formed by Hoover Dam. During much of the distance the Colorado River traverses between Lee Ferry and Lake Mead there are deep canyons which make diversion of the waters impractical.

Canyon Project Act, the United States shall, from storage in Lake Mead, deliver to the State each year at a point or points to be selected by the State and approved by the Secretary, so much water, including all other waters diverted for use within the State of Nevada from the Colorado River system, as may be necessary to supply the State a total quantity not to exceed Three Hundred Thousand (300,000) acre-feet each calendar year. Said water may be used only within the State of Nevada, exclusively for irrigation, household, stock, municipal, mining, milling, industrial, and other like purposes, but shall not be used for the generation of electric power." (Report, pp. 420–421, App. 7.)

However, there are areas where, by the building of extensive facilities, the waters could be diverted, and, in fact, one of the possible points for diversion for the proposed Central Arizona Project lies in this area. Also in this reach of the river, above Lake Mead but below Lee Ferry, the river is joined by several tributaries, principally the Little Colorado River (Arizona and New Mexico) and Johnson and Kanab Creeks (Utah and Arizona). The Virgin River (Nevada, Utah, and Arizona) flows into Lake Mead. The parts of Arizona, Nevada, Utah, and New Mexico drained by these tributaries are included in the Lower Basin of the Colorado River system. It is obvious that consumptive use of the waters before they reach Lake Mead will reduce the quantity of water which will be impounded there subject to delivery under contracts entered into by the Secretary of the Interior.

The United States has asserted that, under a proper construction of the Boulder Canyon Project Act, the Secretary is required to consider uses in Arizona and Nevada from the mainstream above Lake Mead and from tributaries entering the mainstream between Lee Ferry and Lake Mead. Thus we would include in the waters to be distributed to California, Arizona, and Nevada pursuant to Section 4(a) of the Project Act not only waters impounded in Lake Mead, but also all water which would have reached the mainstream above Hoover Dam except for consumptive uses in Arizona and Nevada. The Special Master disagrees, holding that the Secretary may consider only the waters which are actually impounded in Lake Mead and are taken therefrom or from the mainstream below.

Under the terms of the Colorado River Compact, the consumptive use of part of the waters of the Colorado River system was divided between the Upper and Lower Basin States. Since the effectiveness of this Compact depended upon Arizona's approval, which was not forthcoming, the Project Act was made dependent on a modification of the Compact and California's adoption of a Limitation Act accepting a 4,400,000 acre-foot limitation on its use of the initial 7,500,000 acre-feet of mainstream water available annually for the Lower Basin. According to the Special Master's interpretation, the limitation also permits the consumptive use in California of not more than one-half of these waters annually available in excess of 7,500,000 acre-feet. As the Special Master found, the Project Act contemplated the control and use of "substantially all the water of the mainstream" (Report, p. 153) and the distribution of this water under contract by the Secretary of the Interior. It would frustrate this purpose if some of the States could avoid the Project Act allocations by taking the water prior to its entry into Lake Mead.

Section 5 of the Project Act specifically authorizes the Secretary of the Interior "under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof * * *." To be effective such contracts may reasonably require that the uses of water of the mainstream above the dam and the tributaries feeding it should be accounted for in allocations of the water in storage. Unless the Secretary's authority is read in this manner, there is a serious flaw in his

authority to make the distribution among the Lower Basin States.

The Special Master's conclusion that the waters contemplated by Congress in enactment of Section 4(a) of the Project Act are mainstream waters is based on the legislative history, reviewed at pp. 173 to 200 of the Report, which clearly so indicates. His conclusion that the aggregate waters from which California's share is to be derived do not include waters taken from the mainstream or the tributaries above Lake Mead—that the waters contemplated by Congress in the enactment of Section 4(a) of the Project Act are only those which actually arrive in Lake Mead or in the mainstream below Hoover Dam—is predicated primarily on this reasoning:

> * * * The Project Act was concerned primarily with the construction and operation of Hoover Dam, and most of its provisions relate to this basic purpose. Hoover Dam gives the United States physical control over the water stored in Lake Mead and over the use of substantially all of the water in the mainstream below, but it does not enable the United States physically to control the use of water from the mainstream above Lake Mead. Consistently with this physical fact, the provisions of the Project Act do not purport to govern the mainstream above Lake Mead. Section 5 authorizes the Secretary of the Interior to contract for the delivery of water stored in Lake Mead at points which may be agreed upon along the Lake and the mainstream below; that section specifically applies only to water in Lake Mead and to water released therefrom. Also Sections 6 and 8 of the Project Act apply in terms to water con-

> trolled by the United States by means of Hoover Dam.
>
> Section 4(a) must be interpreted within the context just described. Consistent with the other provisions of the Project Act, I interpret Section 4(a), as applying only to Lake Mead and the mainstream below. * * * [Report, p. 183. See also p. 173.]

This analysis, however, overlooks the previously determined fact that Congress authorized a project which it "realized * * * would impound *substantially all* the water of the mainstream * * *." (Report, p. 153; emphasis added.) It appears to attribute to Congress a disregard for anything which might happen above the reservoir to frustrate or partially to frustrate the purposes of the dam. Such disregard for the successful accomplishment of the purposes of the project should not be implied simply from the fact that Congress gave the Secretary of the Interior specific instructions with respect to the operation of the dam and the delivery of waters stored thereby, and spoke otherwise in terms of water "controlled by the United States."[2] It is more reasonable to conclude that when Congress authorized the construction of a

[2] At page 114 of the Report, the Special Master states that no new projects in either the Lower or Upper Basins which would affect Lower Basin mainstream supply can be constructed without congressional action or acquiescence. While we agree with this statement and that the authorities cited support it, nevertheless we think that when Congress (1) authorized the construction of Hoover Dam, which it realized would impound substantially all of the mainstream waters, and (2) authorized the Secretary of the Interior to contract for the storage of such waters and the delivery thereof, it did not contemplate that the contracts the Secretary might make pursuant to that authorizaton might be defeated by a future determination by Congress to divert, or permit the di-

dam capable of impounding and controlling "substantially all the water of the mainstream" and entrusted the operation of that structure to the Secretary of the Interior, Congress intended that the Secretary should do everything reasonably within his broad powers to assure that the waters of the tributaries and mainstream above the dam would not be intercepted before reaching the reservoir.

At pp. 160–161 of the Report the Special Master has very properly declared:

> Clearly the United States may construct a dam and impound the waters of the Colorado River, a navigable stream. *Arizona* v. *California*, 283 U.S. 423 (1931); see *United States* v. *Twin*

---

version of, the mainstream waters before they reach Lake Mead. The words of this Court in *Ivanhoe Irrigation District* v. *McCracken*, 357 U.S. 275, 299–300, respecting the Central Valley Project would seem to be equally applicable to this suggestion concerning the Boulder Canyon Project:

"* * * It would be a physical impossibility to withdraw the facilities. As for the possibility of discrimination in the administration of those facilities, it seems farfetched to foresee the Federal Government 'turning its back upon a people who had been benefited by it' and allowing their lands to revert to desert.[10] The prospect is too improbable to figure in our decision."

"[10] [footnote, 357 U.S. at 300] Senator Gore (then Representative) gave this compelling answer to these trepidations in 1947; 'I cannot conceive of a Government that would spend $384,000,000 building one of the great reclamation-irrigation projects of the world and suddenly because some evil agent of Government had gotten into a bureau, turning its back upon a people who had been benefited by it and who in turn had greatly benefited the Nation by production of food stuffs and wealth. I just do not conceive of the United States as being that kind. * * *' Hearings before the Subcommittee of the House Committee on Appropriations on the Interior Department Appropriation Bill for 1948, 80th Cong., 1st Sess. 737."

595243—61——3

> *City Power Co.*, 350 U.S. 222 (1956); *United States* v. *Chandler-Dunbar Co.*, 229 U.S. 53 (1913); *United States* v. *Rio Grande Irrigation Co.*, 174 U.S. 690 (1899). Clearly, also, once the United States impounds the water and thereby obtains physical custody of it, the United States may control the allocation and use of unappropriated water so impounded. *Ivanhoe Irrigation District* v. *McCracken*, 357 U.S. 275 (1958); *United States* v. *Gerlach Live Stock Co.*, 339 U.S. 725 (1950). * * *

It is just as clear that in making contracts for the storage and delivery of water which it has impounded the United States may properly attach conditions requiring those with whom it contracts and others subject to their control not to interfere with water which would otherwise reach the reservoir. And it is equally clear that in Section 5 and the general scheme of the Project Act Congress has authorized the Secretary so to condition the contracts he makes.

The Special Master has cited three principal reasons for his conclusion that Article 7(d) of the Arizona contract and Article 5(a) of the Nevada contract, to the extent they make the quantities of water deliverable from Lake Mead dependent upon the extent of depletions in the respective States of inflow into Lake Mead, are not authorized by the Project Act and are therefore not enforceable. He says these provisions—

> (1) "are contrary to the command of Section 5 that 'contracts respecting water for irrigation and domestic uses shall be for permanent service * * *,'"

(2) "violate Section 18 [of the Project Act];" and

(3) "result in an allocation of mainstream water totally out of harmony with the limitation on California contained in Section 4(a)." (Report, p. 237.)

There is no inconsistency between these contract provisions and the "permanent service" requirement of Section 5 of the Project Act. As the Report recognizes, pp. 152, 162–163, 202, the Secretary of the Interior was under no compulsion to contract with Arizona and Nevada for the delivery of any particular quantities of water. What he has contracted for is the delivery from Lake Mead

(1) to Nevada of so much water, *"including all other waters diverted for use within the State of Nevada from the Colorado River system,* as may be necessary to supply the State a total quantity not to exceed Three Hundred Thousand (300,000) acre-feet each calendar year." (Report, p. 420, App. 7.)

(2) for use in Arizona of the quantities specified in paragraphs (a) and (b) of Article 7 of the Arizona contract, less the amount by which consumptive uses above Lake Mead shall diminish the flow into Lake Mead (paragraph (d), Article 7). (Report, pp. 400–401, App. 5.)

We do not understand anyone to contend that at the present time the amounts of water which the Secretary of the Interior has contracted to deliver for uses in Arizona and Nevada, respectively, when added to existing upstream appropriations, exceed the amounts allocable to those states. Thus there is no impediment to the fulfillment of both the contracts

and the upstream appropriations as they presently exist. However, if there should be an overage in the future, the permanence of the Secretary's contracts would not be impaired. If the contract rights preceded in time the upstream appropriations, the Special Master recognizes (Report, p. 241) that under the law of both States the contract rights would be senior. Thus there would not be permitted any diversion upstream that would interfere with the senior contract use and thus there would be no occasion for any reduction of deliveries under the contracts and no impairment of their permanence. If, on the other hand, new upstream appropriations should precede the execution of contracts for the full allocations to these States, then the Secretary would be authorized to refuse to enter into contracts for the full allotments. Although this would reduce the quantity of water which the Secretary would contract to deliver, it would not affect the permanency of contracts already made.

The flaw in the Special Master's conclusion is the assumption that upstream uses under new appropriations would cut into deliveries under existing contracts. This is not required either under the State law, as interpreted by the Special Master, or by the provisions of the contracts themselves. Certainly the requirement for permanency was not intended to permit a State to increase its allotment by contracting for the delivery of water from Lake Mead and then proceeding to duplicate its share by withdrawing from the source of that water. The United States in contracting with a State does its part to meet the permanency requirement as to the State when it agrees to

deliver a specified quantity of stored water for use in the State unless the State elects to take or to permit its citizens to take its allotment upstream from the reservoir.

The Special Master errs in suggesting (pp. 239–240), that the provisions in question "generate new causes of uncertainty." On the contrary, they are designed to protect against the very real uncertainty which would arise if the Secretary were to contract for delivery of water from storage without regard to how far the amounts of water available for storage might be affected by upstream depletions. It is to be emphasized that the contracts under discussion are contracts with the respective States, designed primarily to allocate waters for use within those States; they are not definitive contracts for the delivery of specified quantities for specific projects. The States have the choice of having additional projects to be served with stored water or of foregoing them in favor of additional upstream projects. As a consequence, the aggregate water supply for the entire Boulder Canyon Project, including uses in California as well as those in Nevada and Arizona, is made more, and not less, certain. The hazard of impairment of the Project water supply by uncontrolled depletions upstream from the dam is removed. With such depletions taken into account in making commitments for delivery from Lake Mead, the principal uncertainty as to supply remaining results from the forces of nature.

The Special Master's conclusion that Articles 7(d) of the Arizona contract and 5(a) of the Nevada

contract violate Section 18 of the Project Act is equally unsound. Section 18 provides that nothing in the Project Act—

> shall be construed as interfering with such rights as the States now have either to the waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters within their borders, except as modified by the Colorado River compact or interstate agreement.

Apparently the Special Master again construes the contract as requiring rights to delivery under contract to be terminated by later upstream appropriations.[3] He states that this is a flagrant violation of Section 18 and a dictation to Arizona and Nevada of priorities within those States. However, as we point out above, the contract provisions do not require a termination of rights because of subsequent appropriations. Thus this objection is merely an alternative method of stating the first stated objection and falls for the same reason.

As a third reason cited in the report for the conclusion that the Article 7(d) and Article 5(a) provisions are illegal, the Special Master states that enforcement of these provisions would result in an allocation of mainstream water out of harmony with the limitation on California imposed by Section 4(a) of the Project Act (Report, pp. 241–247). In explanation, he supposes total releases from Hoover Dam to permit consumptive uses of 7.7 million acre-feet in

---

[3] We set forth what we believe to be the correct interpretation of Section 18, *infra*, pp. 34–37.

California, Arizona, and Nevada in a year when Arizona's diversions from the Little Colorado deplete the flow into Lake Mead by .1 million acre feet.

> Under the interstate apportionment established by the Section 4(a) limitation on California and the delivery contracts with Arizona and Nevada, of the first 7.5 million acre-feet of mainstream consumption, Arizona would be allocated 2.8 million acre-feet, California 4.4, and Nevada .3. Of the .2 million acre-feet constituting surplus, Arizona and California would each be allocated one-half. Thus to California would be apportioned a total consumption of 4.5 million acre-feet for the year in question. She could not consume more than this amount because of the Section 4(a) limitation, which is based on mainstream considerations only. To Nevada would be apportioned a total consumption of .3 million acre-feet, and she could not utilize more than this since that constitutes her full contractual allotment. To Arizona would be apportioned a total consumption of 2.9 million acre-feet. But if Article 7(d) of her contract were applied in this situation, the Secretary's delivery obligation of 2.9 million acre-feet would be reduced by the amount of the depletion of the flow into Lake Mead, and Arizona could consume only a total of 2.8 million acre-feet from the mainstream. Thus, although 7.7 million acre-feet were released for consumption within the three states for the year, only 7.6 million acre-feet could be utilized under the statutory and contractual limitations. 100,000 acre-feet of water released for consumption could not be used. [Report, pp. 242–243.]

We do not agree with this conclusion. We suggest that the 100,000 acre-feet of Little Colorado depletions is part of the total mainstream supply available for allocation. This is necessary to achieve Congress' purpose to impound and regulate "substantially all the mainstream water" and to accomplish the interstate allocation established by the Section 4(a) limitation on California and the delivery contracts with Nevada and Arizona. We urge the Court to adopt this view.

The Special Master states at pages 243–244 of his report that charging the States with upstream uses, as provided by Articles 7(d) and 5(a), presents problems of measurement since, "for example, 100,000 acre-feet of consumptive use on the Little Colorado will result in a depletion of the flow into Lake Mead by a substantially smaller quantity of water." It is appropriate that Arizona and Nevada should be charged only to the extent such upstream uses actually deplete the mainstream supply available for division between the three States. There is no incompatability between such measurement of the upstream uses and the measurement of Lake Mead and downstream uses by diversions less returns. It is to be remembered that the Article 7(d) and 5(a) provisions have been imposed as conditions upon the deliveries for use in Nevada and Arizona of stored waters in order to protect the common supply available for downstream division. It should not be necessary for the Secretary to charge those States, against their shares of the common supply, with a greater quantity of usage than that quantity by which the upstream uses deplete the common supply.

The task of measuring upstream depletions of the flow into Lake Mead would present an additional, but by no means impossible, complication. The measurement at downstream points of depletions of flow by upstream diversions is based on concepts and standards which receive rather general acceptance in the engineering profession today. (Ariz. Exs. 65 and 65A; Upper Colorado River Basin Compact, Article VI, 63 Stat. 31.) Any problems in administration of the 7(d) and 5(a) contract provisions (Report, p. 246) would be relatively slight in comparison with the complications which might well be involved in case of suit by California to protect itself against "undue depletions on the tributaries and the mainstream above Lake Mead * * *." (Report, p. 247.)

The adverse effect upon California's established projects of the ruling with respect to the Article 7(d) and 5(a) contract provisions ought not to be imposed in the absence of a clear requirement therefor in the controlling statute or its legislative history. We believe no such requirement exists.

POINT III

RELATIVE RIGHTS INTRASTATE TO THE DELIVERY OF COLORADO RIVER WATERS, IN TERMS OF QUANTITY AND PRIORITY, ARE GOVERNED BY THE TERMS OF THE DELIVERY CONTRACTS MADE UNDER AUTHORITY OF THE PROJECT ACT AND BY APPLICABLE FEDERAL LAW RATHER THAN BY STATE LAW

The United States urged the Special Master to determine its right to deliver water to Boulder City, Nevada, under the Act of September 2, 1958, 72 Stat.

1726, and to the several mainstream federal reclamation projects and to nearby lands and users under a variety of contracts which have been made respecting such deliveries. He has declined to make such determinations for these stated reasons:

> The relevant issues for such a decision have not been tried and it would be impossible to determine here all of the relevant rights and priorities under the applicable state laws which would affect a project's water rights. Furthermore, persons who are the most concerned with this decision are other users or potential users in the states, who are not parties to this suit. [Rept. 218, and see 303.]

We do not agree that the relevant issues were not tried; that it would be impossible in this litigation to determine the right of the United States to deliver the waters contracted for or otherwise committed to the several contracting districts and other users; or that there are others not party to this case who are either indispensable or necessary parties to such determination. However, in the interest of expediting a conclusion to this litigation, we have not taken exception to the Special Master's refusal to rule now on these issues.

However, while the Special Master declined to make the determinations sought in this respect, he did state "* * * that state law governs intrastate rights and priorities to water diverted from the Colorado River." (Rept. 216; 303.) And he further declared that "How much water a particular project or user may receive out of a state's total apportionment as against other users in the state who also have

or may in the future obtain delivery contracts with the Secretary of the Interior must be decided under State law." (Rept. 218.) This view is reflected in the recommended Decree (Art. II(C)(1)), which would enjoin the United States, its officers, attorneys, agents and employees from releasing water for "any use or user in violation of state law" except as otherwise provided in the recommended Decree and except as federal statutes otherwise specifically direct. (Rept. 350.) We have excepted to the quoted statements appearing on pages 216 and 218 of the Report, the expressions on pages 217–218 in support thereof, and the quoted portion of the recommended Decree, as inconsistent with the Special Master's primary holding, unnecessary to the decision of this case and in error.

A. THE STATEMENTS IN THE REPORT AND THE PROVISION OF THE RECOMMENDED DECREE RESPECTING APPLICABILITY OF STATE LAW TO THE DETERMINATION OF RELATIVE RIGHTS INTRASTATE TO USE THE BOULDER CANYON PROJECT WATERS ARE UNNECESSARY TO THE RECOMMENDED DECISION AND SHOULD BE ELIMINATED

Since the Special Master has declined to rule on the rights, intrastate, of the United States to deliver water to those agencies and other persons with whom contracts have been made,[4] the statements in the Report respecting the applicability of State laws to such rights and the rights of users under such contracts are not necessary to the recommended decision. This is likewise true as to the language of Art. II(C)(1)

[4] The direction to the Secretary of the Interior by the Act of September 2, 1958, 72 Stat. 1726, to deliver water to Boulder City, Nevada, is treated by the Master as the equivalent of a contract. (Rept. 303.)

of the recommended Decree (Rept. 350) which would enjoin the United States, its officers, from releasing water for "any use or user in violation of state law."[5]

It is submitted that, for the reasons hereinafter set forth, this language in the Report and the related provision of the recommended Decree are erroneous. Acceptance of the Report by the Court without correction of the error might be prejudicial, both to the United States and those with whom contracts have been made, in future litigation to determine the matters upon which the Special Master has declined to rule. It is accordingly urged that the material referred to be purged from the Report and the recommended Decree.

B. BY SECTION 5 AND OTHER PROVISIONS OF THE BOULDER CANYON PROJECT ACT THE SECRETARY OF THE INTERIOR IS GIVEN BROAD POWERS IN THE ADMINISTRATION AND DISPOSITION OF THE PROJECT WATER SUPPLY, INCLUDING THE POWER, BY CONTRACT WITH WATER USERS, TO MAKE ALL APPROPRIATE PROVISIONS RESPECTING QUANTITIES OF WATER TO BE DELIVERED TO DIFFERENT USERS AND THE CONDITIONS ON AND UNDER WHICH DELIVERIES WILL BE MADE

The Boulder Canyon Project Act was enacted by Congress in valid exercise of its powers (1) to control the navigable waters of the United States for the purposes of commerce, including, *inter alia,* the control of floods, improvement of navigation, power production, and watershed and river development, *Okla-*

[5] We believe that if this provision of the recommended decree is to be retained it should be revised to prohibit the violation of the provisions of applicable law. Certainly as far as the United States itself is concerned, it is not theoretically possible for it to violate State law in a field where federal law is dominant. The suggested modification would recognize any State law which might be applicable by adoption as federal law.

homa v. *Atkinson Co.*, 313 U.S. 508; *Arizona* v. *California*, 283 U.S. 423; *United States* v. *Appalachian Power Co.*, 311 U.S. 377; (2) to promote the general welfare through large-scale projects for reclamation, irrigation, and other internal improvement, *United States* v. *Gerlach Live Stock Co.*, 339 U.S. 725; *Ivanhoe Irrigation District* v. *McCracken*, 357 U.S. 275; and (3) to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States. Constitution of the United States, Article IV, Section 3, Clause 2. And see *United States* v. *Grand River Dam Authority*, 363 U.S. 229; *Winters* v. *United States*, 207 U.S. 564; *Federal Power Commission* v. *Oregon*, 349 U.S. 435; *United States* v. *Rio Grande Irrigation Co.*, 174 U.S. 690.

In broad language, Section 1 of the Act (Report, p. 379, App. 3) authorized the Secretary of the Interior to construct, operate and maintain the Project, including Hoover Dam, Imperial Dam, and the All-American Canal system[6] "for the purpose of controlling the floods, improving navigation and regulating the flow of the Colorado River, providing for storage and for the delivery of the stored waters thereof for reclamation of public lands and other beneficial uses exclusively within the United States, and for the generation of electrical energy as a means of making

[6] Additional works and projects, such as Parker Dam, Davis Dam, the Gila Reclamation Project, the distribution system and appurtenant flood control works for the Coachella Division, All-American Canal System, Boulder Canyon Project, have since been authorized to supplement and be integrated with the works originally authorized. See, *e.g.*, 49 Stat. 1039; 61 Stat. 628; H. Doc. 415, 80th Cong., 1st Sess.

the project herein authorized a self-supporting and financially solvent undertaking * * *."

With respect to the storage and disposition of the project water supply, Section 5 (Report, p. 384, App. 3) specifically authorizes the Secretary "to contract for the storage of water * * * and for the delivery thereof at such points on the river * * * as may be agreed upon, for irrigation and domestic uses * * *." That section further provides, *inter alia,* as follows:

> Contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to paragraph (a) of section 4 of this Act. No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated.[7]

In light of the constitutional background for the Project, the language of Section 5 is clearly designed to and does vest in the Secretary of the Interior, as an element of project operation, full authority to contract with users of project waters and to specify the quantities to be delivered to various users and relative priorities as between them.[8] The Section 5 contract authority is substantially unlimited insofar as the

[7] The provisions of Sec. 5, and of Sec. 6 hereinafter referred to, clearly constitute reasonable conditions and limitations on the use of federal funds, federal property, and federal privileges. *Ivanhoe Irrig. Dist.* v. *McCracken*, 357 U.S. 275.

[8] The views expressed by opponents of the Act during the debates in Congress support this analysis of the Section 5 language. H.R. 5773, 70th Cong., 1st Sess., December 5, 1927, contained language substantially as enacted in the first paragraph of Section 5 of the Act. During the debate in the House

project water supply is concerned except for (1) the requirement that contracts shall be "for permanent service and shall conform to paragraph (a) of section 4," and (2) the provisions of Section 6 prescribing priorities as between the various project purposes enumerated in Section 1.[9]

---

regarding H.R. 5773, Mr. Douglas of Arizona, while speaking in opposition to the bill, stated:

"The bill further provides for congressional amendments of State water codes. Further than that, it vests in the Secretary of the Interior complete and absolute control over the waters of the Colorado below Boulder Dam." (Cong. Rec., Vol. 69, p. 9623.)

During the same discussion, Mr. Colton of Utah stated in opposition to the bill:

"You are saying that you are going to take it [water] away from the States and place it in the Federal Government, and Section 5 of this bill asserts that very principle. It provides that the Secretary of the Interior shall have control of all of the water stored in the reservoir and its delivery to any part of the river below." (Cong. Rec., Vol. 69, p. 9648.)

Mr. Colton later remarked, after quoting the first portions of Section 5:

"If that does not give him absolute control of this water, or if it does not seek to give the Secretary of the Interior absolute control of this water, I cannot understand the English language; and, gentlemen, that is exactly what we are objecting to." (Cong. Rec., Vol. 69, p. 9649.)

The proponents of the bill made no response to this interpretation.

[9] Section 6 (Report, p. 387, App. 3) provides as follows:

"That the dam and reservoir provided for by section 1 hereof shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of present perfected rights in pursuance of Article VIII of said Colorado River compact; and third, for power. * * *"

The requirement for satisfaction of "present perfected rights" is dealt with at pp. 307-312 of the Report. And see p. 161.

The broad discretion of the Secretary in the matter of making delivery contracts is recognized at page 215 of the Report:

> * * * I interpret the Boulder Canyon Project Act as empowering the Secretary of the Interior to contract for delivery of mainstream water to states and to individual users, whether private or public. The Project Act does not require or even suggest that the delivery contracts must be made only with states. It is certainly within the discretion of the Secretary, under the Project Act, to contract directly with individual users in the various states for the delivery of water. * * *

This holding accords with the previous statements at pages 152–153:

> The Act itself clearly reserves to the United States broad powers over the water impounded in Lake Mead and delegates this power to the Secretary of the Interior, as agent of the United States. He is specifically authorized to impound the water of the Colorado River in Lake Mead and to exercise custody over the water so impounded through his control, management and operation of the dam and reservoir. No user, whether it be a state or an individual, may receive the impounded water unless the Secretary, by contract, agrees to release it for delivery to that user. Nothing in the Act purports to require the Secretary to agree to deliver specific quantities of water to any particular state or user, except that Section 6 requires him to satisfy water rights perfected as of June 25, 1929. [fn.] *On the contrary, the Act clearly contemplates that water un-*

> *appropriated as of that date is to be made available for use within a state only if the Secretary, within his discretion, contracts for the delivery of the water to that state. In short, no contract, no water,* * * *. [Emphasis added; fn. omitted.]
>
> And at page 216 appears this language:
>
> In other words, the Secretary has agreed with the State of Arizona that he will deliver a certain amount of water to Arizona users, but he has reserved to himself discretion to decide with which users he will contract. This being the case, the Secretary is free, subject to statutory limitations, to contract with users in Arizona qualifying under the reclamation law for delivery to them of certain amounts of water out of the total amount allocated to Arizona. This is precisely what the Secretary has done in the contracts which are before us in this case.

Pursuant to the broad authority conferred by Sections 1 and 5 of the Project Act, the Secretary early in the life of the Project Act made contracts with a number of agencies within the State of California, incorporating in each the so-called Seven-party agreement. This agreement specifies the quantities of Colorado River water which the several agencies may receive and the relative priorities as between them. (See, *e.g.*, Article (6) of the contract of February 7, 1933, between the United States and the Palo Verde Irrigation District, Report, pp. 424–429, App. 8.) The amounts and priorities so specified were "in accordance with the recommendation of the Chief of the Division of Water Resources of the State of

California" (Report, p. 424), but there has never been a determination that they accord in all respects with California law. Regardless of the recommendation of the Chief of the Division of Water Resources, the rights of the several agencies party to those contracts to receive, and of the United States to deliver, water in accordance with the specified quantities and priorities, do not come about by application of state law—they are a matter of contract between the United States and the agencies except as the Project Act provision for satisfaction of "present perfected rights" (Report, pp. 307–312) may require a different order of delivery.

Also under the broad authority vested in him to contract for use and disposition of the Project water supply, the Secretary has made contracts with a water users association and four irrigation districts in Arizona, each of which provides for the delivery of so much water as may be ordered and "reasonably required and beneficially used" within the particular project area, subject only to availability of the water under the Colorado River Compact and applicable federal laws.[10] (Report, pp. 212–214.) There are also outstanding water right application contracts with the individual non-Indian landowners in the Reservation Division of the Yuma Project in California (Report, p. 212). These water right application contracts generally provide for the delivery of either

[10] These contracts make no provision as to relative priority. Presumably, then, the rule of ratability would apply as between them except as the Project Act requirement for satisfaction of "present perfected rights" establishes a different order. See *infra*, pp. 32–34.

a specified quantity of water or so much as may be required to irrigate the lands to be served, subject to a limitation that the amount to be delivered shall not exceed an "equitable proportionate share * * * of the water actually available at the time for all of the area being watered from the same source of supply, *such proportionate share to be determined by the project manager.*" (Cal. Ex. 380; emphasis added.) The Secretary has also made a number of special contracts for the delivery of water through the facilities of the Yuma, Yuma Auxiliary, and Gila Reclamation Projects, for use outside the project areas. (Rept. 214; Ariz. Ex. 163 and 165.) Each of them specifies water quantity and, without regard to the Arizona law relating to priority of appropriation, provides, in accordance with applicable federal law (43 U.S.C. 521; 43 U.S.C. 523), that the use of water thereunder shall be subordinate to the use of water on the respective project areas.[11]

The Special Master has found each of these contracts valid with the exception of one special-use contract which he has found violates the "permanent service" requirement of Section 5 of the Project Act (Report, p. 218). He has also found that the Act of

[11] A more recent demonstration of exercise by the Secretary of his broad authority to contract with respect to the disposition of project water, and in so doing, to determine rights, quantities and priorities, intrastate, is to be found in the contract of November 12, 1959 between the United States and the City of Yuma. By this contract, executed subsequent to the conclusion of the evidence before the Master, the Secretary contracted to deliver a specified quantity of Colorado River water to the City of Yuma but assigned such contract a priority subsequent to all earlier Arizona contracts.

September 2, 1958, 72 Stat. 1726, providing that the Secretary of the Interior shall supply Boulder Canyon Project water to Boulder City, Nevada, effects a valid commitment to the use of Boulder City of a part of Nevada's entitlement under that state's amended contract with the Secretary. (Report, p. 303.)

But in addition to the broad authority to make contracts respecting water deliveries which is extended to the Secretary by Section 5 of the Project Act, Section 14 provides:

> This Act shall be deemed a supplement to the reclamation law, which said reclamation law shall govern the construction, operation, and management of the works herein authorized, except as otherwise herein provided.

Ever since the Reclamation Act was enacted in 1902 (32 Stat. 388), the rights of landowners to receive and use the waters developed by a federal reclamation project have been derived under and determined by contracts made with the United States in pursuance of applicable federal law.[12] As noted

[12] Section 10 of the Act (32 Stat. 390, 43 U.S.C. 373) conferred on the Secretary of the Interior broad authority "to perform any and all acts and to make such rules and regulations as may be necessary and proper for the purpose of carrying the provisions of this Act into full force and effect." Section 5 (32 Stat. 389, 43 U.S.C. 431, 439) required that entries upon public lands to be irrigated by project works be in compliance with the homestead laws and required that at least half the irrigable lands of each entry be reclaimed. Section 5 also provided that "No right to the use of water" developed by the project works "shall be sold" for a tract exceeding 160 acres to any one landowner and that, *inter alia*, "no such right shall permanently attach until all payments therefor are made." Forfeiture of rights for failure to make stipulated payments was

supra, p. 31, the water right application contracts on the Yuma Project, one of the earliest projects built under authority of the Reclamation Act, establish the rule of ratability on an acreage basis in case of shortage in the project water supply. (Cal. Ex. 379.) Later applications on the same project expressly provide that the proportionate share of each landowner should "be determined by the project manager." (Cal. Ex. 378, 380; Ariz. Ex. 168.) The water-right applications on the Salt River Reclamation Project

---

likewise provided for. The proviso to Section 8 (32 Stat. 390, 43 U.S.C. 372) provides: "That the right to the use of water acquired under the provisions of this Act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right."

Further evidence of the retention and exercise by the United States, acting through the Secretary of the Interior, of its power to control the acquisition and definition of rights to receive and use the waters of a federal reclamation project is to be found in many of the subsequent acts of Congress relating to such projects. (See 43 U.S.C., chapter 12.) E.g., the Act of August 13, 1914, 38 Stat. 686, Section 8 (43 U.S.C. 440) authorized the Secretary to make general rules and regulations governing the use of water in the irrigation of the lands within any project and to impose specified requirements respecting the areas under each water-right application or entry to be reclaimed within three and five irrigation seasons and to provide for continued compliance with such requirements. "Failure on the part of any water-right applicant or entryman to comply with such requirements shall render his application or entry subject to cancellation." And the Act of May 25, 1926, 44 Stat. 636 (43 U.S.C. 423–423g), established a procedure for exclusion from an established project of lands found to be unproductive and provided that "the water right formerly appurtenant to such permanently unproductive lands shall be disposed of by the United States under the reclamation law * * *." (43 U.S.C. 423.)

in evidence here contain a similar provision. (U.S. Ex. 31.)

The rule of ratability so frequently applied in the making of contracts for disposition of a reclamation project water supply differs greatly from State laws of prior appropriation. But it is consistent with the broad authority of the Secretary of the Interior "to perform any and all acts and to make such rules and regulations as may be necessary and proper for the purpose of carrying the provisions of this Act into full force and effect." (43 U.S.C. 373.) And the practice which the Secretary has followed and which we believe he is authorized to continue to follow in the making of contracts relating to the storage and delivery of the Boulder Canyon Project water supply, including the fixing, intrastate, of particular quantities and relative priorities, is equally consistent with the broad authority conferred by Sections 1 and 5 of the Project Act.

C. SECTION 18 OF THE PROJECT ACT DOES NOT LIMIT THE BROAD AUTHORITY CONFERRED ON THE SECRETARY OF THE INTERIOR BY SECTIONS 1 AND 5 TO OPERATE THE BOULDER CANYON PROJECT AND TO CONTRACT FOR STORAGE AND DELIVERY OF THE PROJECT WATER SUPPLY

In concluding that "state law governs intrastate rights and priorities to water diverted from the Colorado River," the Special Master relies primarily upon Section 18 of the Project Act. That section provides

> Nothing herein shall be construed as interfering with such rights as the States now have either to the waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters within

> their borders, except as modified by the Colorado River compact or other interstate agreement.

But the first thing to note about this language is its reference to "such rights as the States *now* have." Although the Report does not discuss the significance of this language, it was explained when the amendment which became Section 18 was proposed.

During the discussion in the Senate regarding H.R. 5773, which the House had approved with amendments, Mr. King of Utah offered as an amendment language identical with Section 18 as enacted. Mr. Johnson of California, a proponent of the bill, then stated:

> Mr. President, with the understanding that the verb relates to the present—the rights they now have to do all of the things that subsequently follow—I have no objection to the amendment. [70 Cong. Rec. 593.][13]

---

[13] Other proposals which were much more appropriately worded to accomplish the intent which the Special Master attributes to Section 18 were not accepted.

The House Committee on Irrigation and Reclamation appended a draft of a substitute bill to its report on H.R. 9828, the second version of the third Swing-Johnson Bill. Contained in this draft was the following provision:

"SEC. 8(a) All appropriations of water from the Colorado River, incident to or resulting from the construction, use, and operation of the works herein authorized, shall be made and perfected in conformity with the laws of those states which may or shall have approved the Colorado River compact ratified in section 12 of this act." (H. Rept. 1657, 69th Cong., 2d Sess., p. 32.)

Neither H.R. 9826 nor the substitute draft were enacted into law. However, much of the language in the substitute draft reappeared in the bill which finally became the Boulder Canyon

This emphasis on the word "now" makes plain that Section 18 was intended to do no more than preserve whatever rights the States of the Lower Basin then had to use, and to regulate the use of, waters then subject to their jurisdiction. But these States were then and, we submit, are now without right or authority to use or regulate the use of the waters of the Colorado River as against the exercise by the United States of its right and power to use and control the use of such waters for constitutionally authorized purposes.

The Colorado River is a navigable stream and the Boulder Canyon Project was authorized and constructed in valid exercise of the commerce power (*Arizona* v. *California,* 283 U.S. 423) and other fundamental powers of the United States under the Constitution. *Supra,* pp. 24–25.

In 283 U.S., at pages 451–452, the Court said:

> The United States may perform its functions without conforming to the police regulations of a state. *Johnson* v. *Maryland,* 254 U.S. 51; *Hunt* v. *United States,* 278 U.S. 96. If Congress has power to authorize the construction of the dam and reservoir, Wilbur is under no obligation to submit the plans and specifications to the state Engineer for approval. * * *

This holding with respect to the Arizona law which purported to require submission of the plans and specifications for Hoover dam to the State Engineer

---

Project Act, but Section 8(a) of the substitute draft was omitted.

And see 69 Cong. Rec. 10467.

for approval was but the inevitable consequence of the supremacy clause of the Constitution (Art. VI, Cl. 2) as it has been construed and applied by this Court since the decision of *McCulloch* v. *Maryland,* 4 Wheat. 316, in 1819. The laws of the several States relating to the appropriation, control and use of water which the Special Master says control quantities of and priorities for project water intrastate are police regulations like that provision of the Arizona law considered in the first *Arizona* v. *California* decision.[14]

Applying the same principles in *Ivanhoe Irrig. Dist.* v. *McCracken,* 357 U.S. 275, 295, after upholding the constitutional authority of the United States to construct and operate the great Central Valley Reclamation Project in California, the Court said:

> The lesson of these cases is that the Federal Government may establish and impose reasonable conditions relevant to federal interest in the project and to the over-all objectives thereof. Conversely, a State cannot compel use of federal property on terms other than those prescribed or authorized by Congress. *Public Utilities Comm'n of California* v. *United States,* 355 U.S. 534 (1958). Article VI of the Constitution, of course, forbids state encroachment on the supremacy of federal legislative action.

---

[14] *Vineyard Land & Stock Co.* v. *District Court,* 42 Nev. 1, 171 Pac. 166, 173, 174 (1918); *Pacific Live Stock Co.* v. *Lewis,* 241 U.S. 440, 448, 449 (1916); *In re Mass,* 219 Cal. 422, 424, 27 P. 2d 373 (1933); Kinney, *Irrigation and Water Rights* (2d ed.), vol. 3, sec. 1341, pp. 2428, 2429; Wiel, *Water Rights in the Western States,* (3d ed.), vol. 2, sec. 1184, p. 1097; 30 Am. Jur., *Irrigation,* sec. 3, p. 851.

The Court's opinion in *First Iowa Coop.* v. *Federal Power Commission,* 328 U.S. 152, is especially pertinent:

> The [Federal Power] Act leaves to the States their traditional jurisdiction subject to the admittedly superior right of the Federal Government, through Congress, to regulate interstate and foreign commerce, administer the public lands and reservations of the United States and, in certain cases, exercise authority under the treaties of the United States. * * * [328 U.S. 171.]
>
> The detailed provisions of the Act providing for the federal plan of regulation leave no room or need for conflicting state controls. * * *
>
> * * * * *
>
> It is the Federal Power Commission rather than the Iowa Executive Council that under our constitutional Government must pass upon these issues on behalf of the people of Iowa as well as on behalf of all others. [328 U.S. 181–182.]

See also *Tacoma* v. *Taxpayers,* 357 U.S. 320; *United States* v. *Appalachian Power Co.,* 311 U.S. 377; *Oklahoma* v. *Atkinson Co.,* 313 U.S. 508.

Equally applicable are the decisions of this Court respecting the States' lack of authority to impose conditions upon the use by the United States of its property.[15] See *Ivanhoe Irrigation District* v. *Mc-*

[15] We do not argue the question of federal ownership of the rights to use the waters of the Colorado River or the unappropriated rights to use the waters of the tributaries. But see: *United States* v. *Grand River Dam Authority,* 363 U.S. 229; *Winters* v. *United States,* 207 U.S. 564; *Federal Power Commission* v. *Oregon,* 349 U.S. 435. Since the contracts for the stor-

Cracken, supra, p. 37; *Gibson* v. *Chouteau,* 13 Wall. 92; *United States* v. *Rio Grande Irrigation Co.,* 174 U.S. 690, 703; *Winters* v. *United States,* 207 U.S. 564; *Utah Power & Light Co.* v. *United States,* 243 U.S. 389, 404; *United States* v. *Oregon,* 295 U.S. 1; *Camfield* v. *United States,* 167 U.S. 518; *Hunt* v. *United States,* 278 U.S. 96. In *Federal Power Commission* v. *Oregon,* 349 U.S. 435, 445, where the jurisdiction of the Federal Power Commission rested upon the fact that the project involved would be located on reserved lands of the United States, the Court said:

> To allow Oregon to veto such use, by requiring the State's additional permission, would result in the very duplication of regulatory control precluded by the *First Iowa* decision.

Statutory language which merely preserves "such rights as the States now have" cannot be construed as a grant to the States of any part of the federal government's authority to control the operation of its own projects. Freedom of the States to enact laws does not compel the conclusion that the Secretary of the Interior is bound by those laws. Language more clear and definitive than that of Section 18 is necessary to warrant the conclusion that "Congress has specifically declined to give the Secretary of the Interior authority to deliver water to users within a

---

age and delivery of waters impounded by Hoover dam involve the use of federal funds, federal properties and federal privileges in the sense of physical facilities, and because the Project is authorized in part "for reclamation of public lands" (Project Act § 1), decisions respecting the States' lack of authority to control the use of federal property are applicable.

state in disregard of the state's water law." (Report, p. 217.)

The second thing to note about Section 18 is its generality in contrast with the specific contracting authority granted by Section 5. Of course, it is always held that the specific language of a statute qualifies the general language thereof and not vice versa. *Ivanhoe Irrigation District* v. *McCracken, supra; Fourco Glass Co.* v. *Transmirra Corp.*, 353 U.S. 222, 228–229; *Mac-Evoy Co.* v. *United States*, 322 U.S. 102, 107; *Ginsberg & Sons* v. *Popkin*, 285 U.S. 204, 208; *Arizona* v. *California*, 283 U.S. 423; *Baltimore National Bank* v. *Tax Commission*, 297 U.S. 209, 215. That Section 5 specifically authorizes the making of water delivery contracts on such terms as the Secretary deems appropriate, except as his discretion may be limited by other specific provision, is demonstrated in subdivision B, *supra*, of this part.

Finally, there is to be noted the similarity of Section 18 to Section 8 of the Reclamation Act of 1902 [16] and Section 27 of the Federal Power Act.[17]

---

[16] The language of this section pertinent to this consideration is as follows:

"That nothing in this Act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this Act, shall proceed in conformity with such laws * * *." (June 17, 1902, ch. 1093, § 8, 32 Stat. 390, 43 U.S.C. 383.)

[17] "That nothing herein contained shall be construed as affecting or intending to affect or in any way to interfere with the laws of the respective States relating to the control,

The Special Master suggests that Section 8 of the Reclamation Act, together with the fact that the Project Act is denominated "as a supplement" to reclamation law, "buttress" the conclusion "apparent from the plain language of Section 18 itself, that state law governs rights and priorities among intrastate users." (Report, p. 218.) But the fact is that both Section 8 of the Reclamation Act and Section 27 of the Federal Power Act have been construed by this Court as *not* having the effect which the Report would attribute to Section 18 of the Project Act.

In its decisions respecting the meaning of Section 8 of the Reclamation Act, this Court has distinguished between the *acquisition* of rights to use water for a reclamation project and the *operation* of the project. This was clearly set forth in *Ivanhoe Irrigation District* v. *McCracken,* 357 U.S. 275. As to acquisition of rights, the Court said at page 291:

> As we read § 8, it merely requires the United States to comply with state law when, in the construction and operation of a reclamation project, it becomes necessary for it to acquire water rights or vested interests therein.[18]

---

appropriation, use, or distribution of water used in irrigation or for municipal or other uses, or any vested right acquired therein." (June 10, 1920, ch. 285, § 27; 41 Stat. 1077, 16 U.S.C. 821.)

[18] In this sense § 8 has been construed as meaning that if, in the construction or operation of a reclamation project, the United States impairs rights recognized under State law, compensation must be paid without regard to whether the rights would be valid as against the United States under federal law. *United States* v. *Gerlach Live Stock Co.,* 339 U.S. 725.

But the operation of federal reclamation projects was excluded from any effect by Section 8 by this statement (*id.* at 291–292):

> But the acquisition of water rights must not be confused with the operation of federal projects. As the Court said in *Nebraska* v. *Wyoming, supra,* at 615: "We do not suggest that where Congress has provided a system of regulation for federal projects it must give way before an inconsistent state system." * * * We read nothing in § 8 that compels the United States to deliver water on conditions imposed by the State.

We submit that the Special Master has overlooked this distinction in his reliance on Section 8 and the cases cited.[19]

---

[19] Regardless of what the language in *Ivanhoe* may indicate respecting the effect of § 8 as to the relative rights between a reclamation project and other users within the same State, that is not the question with which we are here concerned. Here, under § 5 of the Project Act, "*No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated.*" It is the relative rights of users under contracts made in accordance with this requirement with which we are concerned. There is no question, and there can be none under the Boulder Canyon Project Act, respecting the rights of persons who are not participating in the project water supply in accordance with the Project Act. In *Nebraska* v. *Wyoming*, 325 U.S. 589, 615, the Court made the same distinction that it made in *Ivanhoe*, as indicated in the quotation in the text. Moreover, the Court in its discussion of § 8 there was not considering the problem we are confronted with here—that of whether relative rights within a federal project to use the project water supply are governed by State law or by the contracts which have been made in pursuance of applicable federal law. The question there was one of title as between the United States and the project landowners. And while under

The contracts which the Secretary has made with the reclamation projects, lands bordering reclamation projects and special users, are for the purpose of disposing of or allocating the impounded Colorado River waters. The power of the Secretary to determine, without threat of veto by State authorities, the quantities and priorities of the water to be de-

---

the particular facts of that case the Court held title to the project water supply was not in the United States, we think the following excerpts fairly indicate the true intent of the holding:

"* * * The water right is appurtenant to the land, the owner of which is the appropriator. * * * Indeed § 8 of the Reclamation Act provides as we have seen that 'the right to the use of water acquired under the provisions of this Act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right.' * * * We intimate no opinion whether a different procedure might have been followed so as to appropriate and reserve to the United States all of these water rights. No such attempt was made. * * * [In this case, it is to be noted, an entirely different procedure has been followed. The United States has *not* followed State prescribed procedures to appropriate the Boulder Canyon Project water supply.] The rights so acquired are as definite and complete as if they were obtained by direct cession from the federal Government. Thus even if we assume that the United States owned the unappropriated rights, they were acquired by the landowners in the precise manner contemplated by Congress." (325 U.S. 614–615.)

And in *Ickes* v. *Fox*, 300 U.S. 82, without discussing the holding as to title to the project water rights, it is even more plain that the determination of title in the project landowners was based, not on State law, but rather on contracts made under federal reclamation law. At page 95 the Court said: "Appropriation was made not for the use of the government, but, *under the Reclamation Act*, for the use of the land owners; and *by the terms of the law and of the contract already referred to*, the water-rights became the property of the land owners * * *." (Emphasis added.)

livered is as essential to efficient and effective operation intrastate as his power to select the persons to whom the water will be supplied. Therefore, as these contracts pertain to the operation of the Boulder Canyon Project, it is clear under the decision in *Ivanhoe* that there is nothing in § 8 of the Reclamation Act, or in § 18 of the Project Act, to preclude the Secretary from delivering water in the amounts and priorities as determined under the contracts, without regard to state laws relating to appropriation, control and use of water.

Sections 9(b) and 27 of the Federal Power Act were construed in *First Iowa Cooperative* v. *Federal Power Commission,* 328 U.S. 152. The issue before the Court was whether under the Federal Power Act a power company, as a condition precedent to the issuance of a federal license to construct, operate, and maintain a power project in navigable waters, had to prove to the Commission that it had met the requirements of the laws of Iowa. This Court held that it was not required to do so as this would give the state a veto over the federal project. At page 164 the Court said:

> * * * Such a veto power easily could destroy the effectiveness of the Federal Act. It would subordinate to the control of the State the "comprehensive" planning which the Act provides shall depend upon the judgment of the Federal Power Commission or other representatives of the Federal Government.

After holding that Section 9(b) [20] of the Act does not require compliance with State law, the Court observed that Section 27 (328 U.S. at 175):

> * * * expressly "saves" certain state laws relating to property rights as to the use of water, so that these are not superseded by the terms of the Federal Power Act.

And it further explained the effect of that section by this statement (*id.* at 175–176):

> The effect of § 27, in protecting state laws from supersedure, is limited to laws as to the control, appropriation, use or distribution of water in irrigation or for municipal or other uses of the same nature. It therefore has primary, if not exclusive, reference to such proprietary rights. The phrase "any vested right acquired therein" further emphasizes the application of the section to property rights. * * *

In other words, the Court considered Section 27 to be an expression of Congress' intention not to exercise its full power to pre-empt the navigable waters of the United States without regard to rights

---

[20] Section 9(b) provides:

"That each applicant for a license hereunder shall submit to the commission—

* * * * *

"(b) Satisfactory evidence that the applicant has complied with the requirements of the laws of the State or States within which the proposed project is to be located with respect to bed and banks and to appropriation, diversion, and use of water for power purposes and with respect to the right to engage in the business of developing, transmitting, and distributing power, and in any other business necessary to effect the purposes of a license under this act." June 10, 1920, ch. 285, § 9, 41 Stat. 1068; 16 U.S.C. 802.)

to the use thereof recognized under state law. See *Federal Power Commission* v. *Niagara Mohawk Power Corp.*, 347 U.S. 239, and, as to Section 8 of the Reclamation Act, *United States* v. *Gerlach Live Stock Co.*, 339 U.S. 725. Cf. *United States* v. *Chandler-Dunbar Co.*, 229 U.S. 53; *United States* v. *Twin City Power Co.*, 350 U.S. 222.

Similar meaning is to be given to Section 18 of the Project Act. Section 18, like Section 27, "saves" such rights as the States then had to waters subject to their respective jurisdictions and to enact laws relating thereto, *but without extending such saving to all vested rights recognized by the States;*[21] *but* Section 5, like Section 9, is not limited or controlled by State law simply because Section 18, as Section 27, "saves" certain rights of the States. Similarly, though Congress by Section 18 has "saved" the right of the States to *enact* laws respecting waters subject to their jurisdiction, there is nothing, either in Section 18 or Section 5, which requires that users under contracts made with the Secretary of the Interior be "under no disability to receive such water under the applicable state law."

We are not unmindful that the language to which we object in Article II(C)(1) of the recommended Decree is qualified by the words "except as federal statutes may otherwise specifically direct." And we realize that at page 217, note 83, the Special Master

[21] The limit of the Project Act's recognition of what might have qualified as state recognized vested rights to use the mainstream waters is the § 6 requirement for the satisfaction of "present prefected rights." Report, pp. 307–312, 161.

has disclaimed any intention to pass on the question "whether other federal statutes such as the Gila Project Reauthorization Act, 61 Stat. 628 (1947), supersede state law in particular cases." But we are also aware that, notwithstanding the specific direction by Congress to the Secretary of the Interior by the Act of September 2, 1958, 72 Stat. 1726, to deliver water to Boulder City, Nevada,[22] the Special Master apparently does not consider this statute any more "specific" than he appears to consider Section 5. For at page 303 of the Report he declares: "Boulder City's priorities are to be determined in the same manner as those of all other Nevada users, *under Nevada law,* * * *." (Emphasis added.)

We respectfully submit that under Sections 1 and 5 of the Project Act the Secretary of the Interior is expressly authorized to make contracts for the storage of water in Lake Mead and for the delivery of such water for the purposes specified in the Act; that this authority of necessity includes authority to contract for the storage and delivery of specific quantities and for the order in which the contracts of the various users will be satisfied; and that there is nothing in Section 18 of the Project Act which can be construed as taking from the Secretary and vesting in State agencies any part of the authority so conferred on the Secretary.

---

[22] Section 9(d) of the Act provides that if the requirements of the municipality shall at any time exceed 3,650 gallons a minute the Secretary may furnish whatever additional water and whatever additional carrying capacity may be needed.

POINT IV

THE NEVADA WATER DELIVERY CONTRACT DOES NOT EXHAUST THE AUTHORITY OF THE SECRETARY OF THE INTERIOR UNDER SECTION 5 OF THE BOULDER CANYON PROJECT ACT TO CONTRACT FURTHER FOR THE USE OF IMPOUNDED WATER WITHIN THE STATE OF NEVADA OR TO APPLY UNUSED WATER TO USE ON FEDERAL PROJECTS

At page 210 of the Report the Special Master stated:

> It should be noted that the Nevada contract, unlike the Arizona contract, does not require additional subcontracts between each water user and the Secretary of the Interior. On the contrary, the State of Nevada is free to determine who shall use the water, subject only to the Secretary's approval of the points of diversion.

The United States has excepted to this and urges that the language of the recommended decree, referred to in the footnote, should not be construed to implement it.[23]

---

[23] Article II(B)(6) of the Recommended Decree in the Special Master's Draft Report (p. 309) stated that water apportioned for consumptive use in a state but not consumed

"*whether for the reason that users therein do not have delivery contracts for the full amount of the state's apportionment*, or that they cannot apply all of such water to beneficial uses * * *." (Emphasis added.)

might be released by the Secretary of the Interior for use in other States. Nevada, in commenting on the Draft Report, proposed that the provision emphasized in the language quoted be amended so as to give recognition to Nevada's contention that the requirements of Section 5 of the Project Act are fully satisfied by Nevada's amended contract insofar as uses of stored water in that State are concerned. The United States

Article 5(a) of the contract, as amended January 3, 1944 (Rept. p. 420, App. 7), provides that, subject to availability of the water for use in Nevada, the United States shall annually deliver to the State from storage in Lake Mead—

> so much water, *including all other waters diverted for use within the State of Nevada from the Colorado River system,* as may be necessary to supply the State a total quantity not to exceed Three Hundred Thousand (300,000) acre-feet each calendar year. * * * [Emphasis added.]

In our view this contract, like the Arizona contract, is effective to allocate for use in the State the quantity of water therein specified, in accordance with the plan for interstate allocation of mainstream water contemplated by the Project Act. But only to the extent that Nevada itself may qualify as a *user* of water does it satisfy the requirement of Section 5 that no person shall have or be entitled to have the use of the stored water except by contract made as stated in that section. Uses in Nevada made by others than the State continue to be governed by that requirement and, as demonstrated in part III, *supra,* the validity of such uses and the extent of the rights therefor must depend upon their recognition by contracts with the users

---

opposed this proposal during the argument before the Special Master August 17–19, 1960. Article II(B)(8) (which is the counterpart of II(B)(6) in the earlier draft) of the Recommended Decree reads:

"* * * whether for the reason that delivery contracts for the full amount of the state's apportionment are not in effect or that users cannot apply all of such water to beneficial uses * * *." (Rept., p. 349.)

made by the Secretary in conformity with *all* of the Section 5 requirements. While Nevada may make recommendations to the Secretary respecting the making of contracts with users in that State, the provisions of Section 5 do not authorize or permit the substitution of State regulation for the discretion which the Project Act authorizes the Secretary to exercise.

We submit that the statement at page 210 of the Report to which we have excepted is in conflict with the provisions of Section 5. We submit further that it does not give proper meaning to the language of Article 5(a) of the contract underscored in the quotation above. If that language is read to mean what it says, the contract will not only be given literal meaning, but the conflict with Section 5 of the Act, which the Master's interpretation engenders, would be eliminated.

The underscored language excludes from the agreement to deliver "to the State" all other diversions for use within the State. Such exclusion preserves the Secretary's authority to contract with users in Nevada and precludes the possibility of an attempted waiver of the Section 5 requirement for contracts with *all* users. It likewise constitutes an effective reservation of the United States' general power to provide, within the unused part of Nevada's allocation, for uses on federal projects within Nevada. (Rept., 257–266; 292–294; 297; 303). So construed, it is plain that the language of Article 5(a) of the contract providing for delivery "to the State" is but a shorthand way of saying, as in the Arizona contract

(Rept. 400, App. 5): "The United States shall deliver * * * water * * * for * * * use * * * in [Nevada] * * *."

We have shown in Point III, *supra,* that there is no basis in the Project Act, or in the decisions of this Court, for concluding that the Secretary of the Interior is subject to the control of Nevada in delivering water from storage in Lake Mead. The State of Nevada is not "free to determine who shall use the water." Nor is it free to determine the priority of the various water users under such contracts as may be made. These matters rest within the discretion of the Secretary of the Interior in exercising his authority to make contracts disposing of waters of the Colorado River impounded by Hoover Dam.

The Court is requested to reject the conclusion at page 210 of the Report, above quoted, and to make clear that Article II(B)(8) of the Recommended Decree, if it is approved by the Court, does not impair either the authority of the Secretary to contract with users in Nevada under Section 5 of the Project Act or the general power of the United States to apply unused waters within the Nevada apportionment to use on federal projects in that State.

POINT V

THE UNITED STATES IS ENTITLED TO USE ON ITS WILDLIFE REFUGES WATERS SALVAGED IN DEVELOPMENT OF THE REFUGE AREAS WITHOUT REGARD TO PRIORITIES ESTABLISHED BY CREATION OF THE REFUGES

With respect to the Havasu Lake National Wildlife Refuge and the Imperial National Wildlife

Refuge, both on the mainstream of the Colorado River, the United States proved that the change in and control of the vegetation which will be effected by the development of these refuge areas will result in water consumption less than that which presently occcurs in the overflow and undeveloped areas where the refuges are presently located. (Tr. 15,691; 15,694; 15,753; 15,759–60.) The Special Master omitted to make the Findings of Fact proposed by the United States reflecting this salvage of water, and further omitted to provide in the Conclusions of Law and Recommended Decree that water salvaged by the United States from the mainstream of the Colorado River may be used by it on federal mainstream Wildlife Refuges without limitation by the priority dates decreed for the respective refuge areas.

It is a fundamental maxim of water law that the right to use the portion of stream flow salvaged by means of artificial improvements belongs to the one making the improvements. Hutchins, *Law of Water Rights in the West,* pp. 361, *ff.* Decisions in support of this proposition have been rendered by a number of the Supreme Courts of the western States.[24] Recognition of the salvage doctrine is to be found also in the decisions of this Court. *Washington* v. *Oregon,* 297 U.S. 517, 522–23; *Nebraska* v. *Wyoming,* 325 U.S. 589, 618–9.

---

[24] For example, *Pomona Land & Water Co.* v. *San Antonio Water Co.*, 152 Cal. 618, 623–624 (1908); *Reno* v. *Richards*, 32 Idaho 1, 6, 12–13 (1918); *Ironstone Ditch Co.* v. *Ashenfelter*, 57 Colo. 31, 43–44 (1914).

The application of this principle in this case will not disarrange the allocation or priority schedule recommended by the Special Master. Quantities and priorities of water rights for the mentioned Refuges are provided by Article II, Subdivision (C), paragraphs (2)(g) and (2)(h), of the Recommended Decree (Rept., pp. 352–353). Recognition of the additional basis of right, the right to use water salvaged by the development of these Refuge areas without limitation by priority dates, would in no way increase the quantities used beyond those presently specified in the Recommended Decree. We believe there should be added to each of the paragraphs of the Recommended Decree last above noted a proviso to the following effect:

> *Provided,* That to the extent the water used on such Refuge shall be salvage water resulting from development of the refuge area, such water may be used without regard to such priority dates.

CONCLUSION

For the foregoing reasons it is respectfully submitted that the exceptions filed by the United States should be sustained.

ANSWERING BRIEF FOR THE STATE OF NEVADA, Intervener

PATTERN OF THE BRIEF

In aid of a useful arrangement of material, Nevada in this Brief will, in answering the Opening Briefs, first outline her position in opposition to them. Then she will consider the Briefs of the other parties separately, stating first its answer to California (pp. 29–48, *infra*). The answer to California's lengthy Brief

will consist principally of a discussion of the general issues rather than any attempt to make a detailed point by point reply. It will answer those portions of the Brief of the United States to which it wishes to reply (pp. 49–61, *infra*); and lastly, its comments on Arizona's Brief (pp. 61–65, *infra*). Since Utah and New Mexico have filed no Briefs, no comment is made on the Master's decision with respect to the rights of those States.[1]

SUMMARY OF ARGUMENT

I

It is clear from the Opening Briefs filed herein that Intervener Nevada's principal controversy is with California. For California seeks to reduce Nevada's contract rights to the beneficial consumptive use of 300,000 acre feet of the waters of the Colorado River stored in Lake Mead to a mere 120,500 acre feet. This controversy will, of course, be resolved by the basic issues in the case.

Nevada has a subsidiary controversy with the United States who contests the Master's findings that that portion of Article 5(a) of Nevada's amended contract requiring the deduction of her tributary uses from her contract supply is invalid. The United States further objects to the Master's finding that Nevada's basic contracts are sufficient and that it is not necessary to have additional contracts with each individual water user. Finally, there is a difference of views between Nevada and Arizona who contends that Article 7(g) of her contract, wherein she agreed that Nevada could have 4 percent of any excess or surplus water, is invalid.

---

[1]The omission herein of an answer to any specific argument or point in any one of the Briefs does not necessarily indicate the agreement of Nevada to the position taken by the other parties. Some arguments are unanswered as a result of judgment concerning their relative importance and relevancy and a desire to eliminate controversy on as many issues as possible.

II

Nevada is entitled to the beneficial consumptive use of 300,000 acre feet of water stored in Lake Mead under any theory that may be adopted by this Court in deciding this case. Whether Section 4(a) of the Boulder Canyon Project Act (hereinafter, Project Act) relates only to mainstream water, as the Master found, or water of the entire system, does not affect the validity of Nevada's allocation of 300,000 acre feet of Lake Mead stored water. It affects only the accounting necessary to determine the quantity of excess or surplus water, if any.

Nevada's contract rights are valid whether Section 4(a) of the Project Act constitutes a statutory contractual allocation, or whether the contracts were made under the general Reclamation Law. The amount contracted to Nevada corresponds to the amount discussed as her allocation in the Congressional debates preceding passage of the Project Act. It is an amount which reflects a proper exercise of the discretion vested in the Secretary of the Interior.[2] Likewise, Nevada's contracts are valid if that section is a mandatory formula, as Arizona contends. Particularly, both the amount of water awarded Nevada in her contracts, and the validity of the contracts, must be upheld in the event that the Court determines this case upon the basis of an equitable apportionment of the waters of the Colorado River among the three sovereign States in the Lower Basin.

Nevada is unique in that it has no other source of water than Lake Mead. There is no ground water to be developed, or any salt or brackish water that can be converted. The Colorado River water is literally the life blood of the area and is the controlling factor as to the population that can live there. On the other hand, California has alternate sources of water, both by

---

[2]Hereinafter "Secretary" shall mean the Secretary of the Interior.

the newly authorized diversions from the water-surplus area of Northern California and from the salt water conversion program now actively under development.

III

There is a complete answer to much of California's argument when it is realized that since the Colorado River is a navigable river, the Secretary, by reason of the Project Act and the construction of the Hoover Dam, had a right to, and did take full and complete control of all of the water of the Colorado River at that point, free of any prior claims. California's uses on the Yuma Project (partly an Indian Reservation project) and in the Palo Verde Valley, which existed prior to this time, undoubtedly thus lost their priority. But this is academic because the Master has defined the present perfected rights which existed as the date the Project Act became effective (June 25, 1929), so as to include these rights, and has provided for their protection in short water years. There is no evidence of any conceivable water shortage which would diminish these rights under the Recommended Decree.

The rights of the Imperial Irrigation District, which had been using water which flowed northward out of Mexico, after having been diverted through that nation, was likewise of a type which could not claim priority over the right of the Secretary of the Interior to store water at Lake Mead. In addition, by reason of the specific provisions of the Project Act which, among other things, provided for the construction by the United States of a new diversion point for an All-American Canal leading to this District, and for contracts providing Lake Mead stored water for use thereon, the Imperial Irrigation District right became and is solely a right to Lake Mead stored water, under the terms and conditions of its contract. The right of the Metropolitan

Water District, which was only a paper filing at the effective date of the Project Act, depends entirely on a contract with the United States dated April 24, 1930, and subsequent contracts. All of these California uses or rights were changed from whatever status they may have had as normal flow rights prior to the construction of Hoover Dam, and thereafter became merely contract rights for stored water on a parity with similar rights of Arizona and Nevada and the water users in those States. This is precisely in accord with the provisions of Article VIII of the Colorado River Compact (hereinafter, Compact).

IV

There is no validity in California's repetitious argument that she still retains, after the construction of Hoover Dam and Lake Mead, water rights founded upon which she terms "equitable apportionment and priority of appropriation."

The doctrine of appropriation (first in time is first in right) is the foundation of Western water law as to intra-state rights, and grew out of the customs and usages of those who first settled the arid West. It is the very antithesis of any kind of apportionment, equitable or otherwise. On the other hand, the doctrine of equitable apportionment grew out of what might be termed "interstate-international" law, as developed by this Court in determining controversies between sovereign States. The coupling of the two in one descriptive phrase is a misnomer, and leads only to confusion. Priority of appropriations is not controlling in an interstate equitable apportionment suit. It is only one of many factors to be considered. This is particularly true where, as here, the apportionment must be of stored water, the rights to which are represented by contracts with the Secretary of the Interior.

V

"Present perfected rights" as used in the Compact, the pertinent statutes, and the contracts, has a definite and precise meaning. Originating in the Compact, it is clear that it was intended to refer to something other than appropriations, which might exist under State law as only paper filings or partially used appropriations. It seems the most logical to interpret such rights as those which had been perfected and were in use at the date of the execution of the Compact (November 24, 1922). But, in any event, this phrase could not include any rights other than those actually perfected as of the effective date of the Project Act, as the Master determined.

VI

A finding as to the dependable supply of the Colorado River, sufficiently accurate for an allocation in perpetuity is impossible of attainment. There is no need for making it in this action. The Recommended Decree fully protects the rights of all the parties. It is not needed as a foundation for a justiciable controversy for the controversy is one concerning the waters stored in Lake Mead and the validity and effect of the contracts disposing of it. This controversy, in existence for years, is entirely independent of any question of dependable supply.

VII

There is nothing in the Brief of the United States which seriously challenges the soundness and correctness of the Master's decision holding that the provisions of Article 7(d) of the Arizona contract and Article 5(a) of the amended Nevada contract, which charges tributary uses in these States against the contract amounts to be delivered from storage in Lake Mead, are in violation of the Project Act and unenforceable.

There are reasons other than those relied upon by the Master why his decision is proper and sound. The legislative history of Section 4(a) of the Project Act demonstrates clearly that Congress intended that Nevada should have an undiminished 300,000 acre feet of beneficial consumptive use from the mainstream. There is nothing in it even remotely suggesting that this amount should be reduced by tributary uses in Nevada above Lake Mead.

There is nothing in the Project Act that authorized, directed or permitted the Secretary to limit Nevada's allocation of water from Lake Mead by deducting therefrom tributary uses in Nevada. Nor could any act of any Nevada official in signing such a contract be deemed to be a waiver or release of any rights which that State, as a sovereign, possessed.

If the Court should concur in Arizona's view that the second paragraph of Section 4(a) of the Project Act established a formula for the allocation of mainstream water among the three Lower Basin States which the Secretary, in making water delivery contracts, is required precisely to follow, then these provisions in both the Arizona contract and the Nevada contract, which obviously deviate from the formula, are void.

The Nevada contract is entirely consistent and in accord with Section 5 of the Project Act. Nevada is a "person" as used in that section, and therefore entitled to have the use of the water contracted for.

The Nevada contract was drafted in the light of circumstances peculiar to Nevada. Existing and future uses of Lake Mead water will be for industrial and municipal use. It would be ridiculous to require individual and duplicate contracts for each industrial and municipal user of Lake Mead water. It is logical and sensible that the water delivery contracts be with the State of Nevada, acting through its Colorado River Commission of Nevada, an entity created by law specifically for this purpose.

VIII

Nevada is in general agreement with the position taken by Arizona since it supports the Master's Report and Recommended Decree in all essential respects.

We concur generally with Arizona's argument that the Project Act provides for the storage of mainstream water only and for its allocation among the three Lower Basin States. Whether this Court concludes that the Master was correct or whether Arizona is correct, in their respective interpretations of the Compact with respect to mainstream water, the results, so far as Nevada's rights are concerned, would be the same. Nevada would still be entitled, under its contracts, to an undiminished 300,000 acre feet of water from Lake Mead.

One point of difference between Arizona and Nevada concerns the validity of Article 7(f) of the Arizona contract which provides for the recognition by Arizona of the right of Nevada to contract with the United States for the use of 4 percent of any excess or surplus water which she claims to be invalid. The Master held this provision to be valid and Nevada concurs.

In the unlikely event that this Court should find Article 7(f) of the Arizona contract void, then Nevada submits that that part of the Recommended Decree permitting Nevada to contract with the United States for 4 percent of the excess or surplus should be retained irrespective of any provisions of the Arizona contract. Nevada's right to an equitable share of the excess or surplus is not dependent upon any recognition or consent by Arizona in its contract, or otherwise.

Nevada concurs in Part II of Arizona's Brief in opposition to the views expressed by the Master with respect to the unrestricted right of the United States to reserve water for all Federal establishments.

ARGUMENT

I

NEVADA'S ALIGNMENT AS AGAINST OTHER PARTIES

Nevada, an intervener, submits that it is now more apparent than ever that the final decree to be entered herein should uphold the validity of her contracts with the United States[3] as awarding her the right to the full beneficial consumptive use of 300,000 acre feet[4] of Colorado River water from Lake Mead, or below, as and when needed. Also, that she is entitled to this amount of water under whatever interpretation there may be made of the language of Section 4(a) of the Boulder Canyon Project Act.[5] Or, more broadly speaking, under whatever theory may be followed in apportioning Colorado River water among the States of the Lower Basin.

It is clear that the real controversy in this action, so far as Nevada is concerned, is between her and California. There is a subsidiary controversy between Nevada and the United States, so far as the latter urges diminution of Nevada's full 300,000 acre feet claim by deduction of Nevada upstream tributary uses; and contends that each Nevada user must have an individual contract with the Secretary.

The direct conflict between California and Nevada is this: As against Nevada's claim to a full 300,000 acre feet of beneficial consumptive use from Lake Mead, California asserts that

---

[3]Appendices 6 and 7, Report, pp. 409–422.

[4]Throughout this Brief, when referring to Nevada's rights to 300,000 acre feet, it is always intended that this figure be read as a beneficial consumptive use of that amount, whether those specific words are used or not. And "consumptive use" is used as meaning diversions from the stream less return flow, as defined by the Master in his Recommended Decree (Paragraph I, (A), Report, p. 345).

[5]45 Stat. 457, 43 U.S.C. 617.

Nevada is entitled only to the amount needed for the ultimate development of mainstream projects authorized or constructed to date in the total amount of 120,500 acre feet.[6] In this connection she concedes that Nevada is additionally entitled to her uses on the tributaries which flow into Lake Mead (the Muddy and Virgin Rivers) in the amount of 31,000 acre feet of beneficial consumptive use. Elsewhere, California argues, however, that in the event Nevada's contract rights are upheld, that this Court should overrule the Master's decision invalidating that provision in Section 5(a) of that contract, which provides that Nevada's mainstream uses shall be diminished to the extent of her upstream tributary uses. In other words, California aligns herself with the United States on this phase of the case.

The differences between Nevada and the United States divides itself into two parts. Nevada urges the correctness of the Master's recommendation declaring the invalidity of the provision in Article 5(a) of the contract between Nevada and the United States which provides that her use of mainstream water should be reduced by deducting therefrom the amounts of her upstream tributary uses. And the United States denies that the Colorado River Commission of Nevada, a statutorily created entity[7] created for the express purpose of contracting for, receiving, paying for and controlling the distribution of all Colorado River water to which Nevada is entitled, can alone contract for Nevada's water supply. It urges that, in addition, separate contracts must be made between the Secretary and each individual user in Nevada, although concededly, the Nevada contracts do not so specifically provide, as contrasted with the Arizona contract[8] which does so provide.

---

[6]California's Brief, pp. 18, 22.

[7]Appendix II, Nevada's Opening Brief, pp. 106–109.

[8]Appendix 5, Report, pp. 399–407.

The controversy between Nevada and the United States admittedly involves only an interpretation of the applicable statutes, and a correlative determination of the power of the Secretary in the pertinent respects.

On the other hand, the resolution of the controversy between Nevada and California involves the whole question as to the fundamental correctness of the Master's Report. The basic concepts upon which the Master, among other things, found that Nevada was entitled to the benefit of her two contracts with the United States, giving her the right to apply up to 300,000 acre feet of Colorado River water to beneficial consumptive use, are challenged by California with a myriad of points of attack. In Nevada's opinion, to attempt to answer California's voluminous Brief, paragraph by paragraph, or even topic by topic, would be pointless and result only in endless repetition—in fact, such repetition is the outstanding characteristic of the California Brief. On the other hand, the resolution of a few fundamental questions can perhaps better indicate the incorrectness of the California position.

Since Arizona supports the Master's Report and Recommended Decree in all essential respects, Nevada is in general agreement with Arizona, except that she does take issue with Arizona as to the validity of Article 7(g) of the Arizona contract, which recognizes the right of Nevada to contract with the United States for 4 percent of any excess or surplus. Nevada asserts the validity of this paragraph.

Nevada does not take issue with either Utah or New Mexico on any aspect of the Master's Decision and Recommended Decree relating to those States.

II

NEVADA ENTITLED TO AN UNDIMINISHED 300,000 ACRE FEET OF STORAGE UNDER ANY THEORY

From the point of view of the State of Nevada, the Decree herein should award her the right to the beneficial consumptive use of 300,000 acre feet of water stored in Lake Mead under any theory that might be adopted by this Court in deciding this case. This is true whether it be determined that Section 4(a) of the Project Act related only to mainstream water, as the Master found, or to system water, as contended by California.

This is true whether Section 4(a) of the Project Act is construed as authorizing and directing the Secretary, under Section 5, to make allocations of mainstream water among the three Lower Basin States by means of water delivery contracts, as the Special Master decided, or whether Section 4(a) is construed as establishing a mandatory formula for the allocation of mainstream water among the three Lower Basin States which the water delivery contracts made by the Secretary are required to conform, as contended by Arizona. Likewise, this would be true if contracts for the delivery of storage water were made by the Secretary under the general Reclamation Law[9] irrespective of the Project Act. Particularly, if any or all theories of statutory or secretarial allocations are discarded and the case be determined on the basis of equitable apportionment among the three Lower Basin States, a confirmation of the 300,000 acre feet right of Nevada is emphatically correct and proper.

A. The Controversy as to Whether Section 4(a) Relates to Mainstream Water Only.

Of course, one of the crucial decisions of the Master was his determination that by the language used in Section 4(a) of the

---

[9] Act of Congress, approved June 17, 1902 (32 Stat. 388, 43 U.S.C. 391) and acts amendatory or supplementary thereto.

Project Act, the Congress intended that 7,500,000 acre feet of mainstream water should be annually allocated so that California should receive 4,400,000 acre feet (the maximum permitted under the specific limitation imposed upon her by the Project Act; a limitation which California accepted by its own legislative Act),[10] Arizona 2,800,000 acre feet and Nevada 300,000 acre feet; referring in all instances to beneficial consumptive use. As set out in his Report (pp. 151–185) the reasons for arriving at this conclusion are logical and convincing and no good purpose would be served by repeating or elaborating upon them in this Brief. California, disagreeing violently with this conclusion, devotes a large part of her Opening Brief to argument upon this phase of the case. (California's Brief, pp. 69–138.) In the last analysis, her argument amounts to repeating innumerable times and in a bewildering variety of approaches, the theme that "Compact means Compact." And that, accordingly, it must follow that since the waters apportioned by Article III(a) of the Colorado River Compact[11] were those of the entire Colorado River System, the 7,500,000 acre feet referred to in Section 4(a) to which California's limitation applies would be system water and not mainstream water.

So far as the claim of Nevada to the beneficial consumptive use of 300,000 acre feet of Lake Mead water is concerned, the determination of this particular question is immaterial. Under the Master's Recommended Decree, this amount of beneficial consumptive use is awarded to Nevada out of mainstream water. If California is correct, and Section 4(a) should be interpreted as applying to system water instead of mainstream water, the situation, so far as this right of Nevada is concerned, is

---

[10]California Limitation Act, Act of March 4, 1929; Ch. 16, 48 Session; Statutes and Amendments to the Codes, 1929, pp. 38–39.

[11]Appendix 2, Report, pp. 371–376.

unchanged. Her contracts call for this amount of stored water. Lake Mead will be the source of the supply. The interpretation of this Section as to whether it applies to the mainstream or the tributaries goes only to the accounting phase; and that accounting would not affect Nevada's 300,000 acre foot allocation.

The only phase of the interstate allocation affected by the determination as to whether Section 4(a) relates to mainstream water only, or system water, is in the determination of the excess or surplus. Nevada is interested in that phase of the case to the extent that when proper contracts with the United States have been executed, she will be entitled to 4 percent of the surplus to be deducted from Arizona's one-half share. As mentioned in Nevada's Opening Brief (p. 40), it is her opinion that there is ground to believe the Master erred in classifying the one million acre feet of water apportioned by Article III(b) of the Compact as excess or surplus. We once more comment that if the Master's decision on this point should be reversed and it be held that Section 4(a) be deemed to refer to 7,500,000 acre feet of system water, then it automatically follows that the million acre feet apportioned by Article III(b) to the Lower Basin would not be surplus or excess. California would not be entitled to take one-half of that million acre feet over and above her 4,400,000 acre foot limitation. In short, the total combination of the Master's determination that while the 7,500,000 acre feet allocated is mainstream water only, but that Article III(b) is excess to which California is entitled to one-half, is a decision extremely favorable to California.

B. Nevada's Rights Under a Statutory Contractual Allocation.

It is the position of all the active parties to this action, other than the State of California, that the Master is correct in his Report and Recommended Decree in determining that properly interpreted Section 4(a) of the Project Act created a statutory

contractual allocation scheme; that is, by the Project Act Congress authorized and directed the Secretary, under Section 5, to make allocations of mainstream water among the three Lower Basin States by water delivery contracts. Under this theory of the case, Nevada is entitled to an undiminished 300,000 acre feet of beneficial consumptive use from the waters stored in Lake Mead.

This is a lesser amount than will be needed by Nevada by the year 2000, according to her evidence herein (Appendix I, Opening Brief, pp. 63–105). However, under all the circumstances, Nevada has not excepted to the Master's Report and is willing to accept a decree awarding her this amount of Lake Mead water as being proper.

Here we find the provisions of the Project Act expressly providing that there shall be contracts with reference to the water stored in Lake Mead and that no one is entitled to water without such a contract. These provisions carry with them the necessary ingredient of authority in the Secretary to determine the amount of water for which he will contract as to each user. It is inherent in the Project Act itself, and clear from the legislative history, that secretarial contracts would be used in determining the amounts of water to be ultimately diverted in each State.

It offends nothing in the Project Act for this Court to now find valid the contracts which the Secretary has made, including the two awarding Nevada the beneficial consumptive use of 300,000 acre feet.[12] The amount contracted for is precisely the amount that

---

[12]Wherever in this Brief Nevada asserts its right to the beneficial consumptive use of 300,000 acre feet under its contracts, it is intended to express the single exception that the provision in Article 5(a) of that contract charging tributary uses against the 300,000 acre feet is not valid, whether expressly stated at that time or not. For brevity's sake, an attempt has been made to eliminate the constant repetition of this exception, but it is always there in this presentation.

was discussed as being Nevada's requirement through the whole legislative debate in Congress. It is the amount prescribed as a proper allocation to Nevada in the preapproved Tri-State Compact referred to in the second paragraph of Section 4(a) of the Project Act. In fact, it is the precise amount which the Master found as Nevada's share if the Act is treated as a statutory allocation.

The contract amount is a fair and equitable amount if Nevada's future needs are taken into account as shown by Nevada's evidence herein. The proof shows that by the year 2000 Nevada's needs, even if her growth continues at no greater than the present rate, will exceed this amount before the end of the century. It is a fair amount, having in mind the fact that Colorado River water, and specifically waters stored in Lake Mead, are the sole possible sources of supply for the Southern Nevada area.

Taking all of the above into account, the Secretary acted within the boundaries of his authority and within the complete limits of his discretion in contracting with Nevada for the beneficial consumptive use of 300,000 acre feet. In fact, this amount is in the nature of a borderline amount, and any attempt to limit Nevada to a lesser amount could well be described as an abuse of discretion. Certainly nothing in the Nevada contracts (except only part of Section 5(a)) can in any way be characterized as a violation of the Secretary's discretionary power if the case is viewed in that light. Having full right to the waters stored in the reservoir, the Nevada contracts made by the Secretary are valid and binding and should be given full force and effect.

Paranthetically, we might here mention in passing that several remarks or intimations in the California Opening Brief indicate its contention that contracts, such as those of Nevada, are similar to water right appropriations, and the accompanying implications that unless the use thereof is completed with what is defined as

due diligence, the right covered therein might be lost. This we directly challenge.

Obviously, it is the duty of the State to provide for its future growth and its future citizens equally as it must provide for those presently in existence. The development of large scale projects such as will be required to complete the full use of Nevada's water rights must and should extend over a period of many years. The Project Act itself stated that the contract should be for permanent service. There is nothing in the Project Act or in the basic law indicating that Nevada's contracts are defeasible, or that the right to use the amount of water provided can be lost if not promptly exercised. The contracts themselves, and the Recommended Decree, protect against any waste of water by allowing interim use thereof prior to the time required by the contracting State.

Arizona, while agreeing that the Project Act authorizes and directs the Secretary to allocate mainstream water by water delivery contracts among the three Lower Basin States, goes further and contends that the second paragraph of Section 4(a) established a formula for the allocation of the waters of the mainstream among the three Lower Basin States to which the water delivery contracts made by the Secretary are required precisely to conform. If this Court should agree, then clearly Nevada would be entitled to an undiminished 300,000 acre feet of beneficial consumptive use from stored water in Lake Mead.

C. Nevada's Rights Under Contracts Made Under the General Reclamation Law.

Another alternative theory upon which Nevada's right to an undiminished 300,000 acre feet of storage from Lake Mead could be sustained, is the Secretary's authority to make contracts under the general Reclamation Law. The Secretary, under the

general Reclamation Law,[13] had the basic right and obligation to make water delivery contracts for the delivery of stored water which, in effect, would constitute an allocation among the three Lower Basin States, irrespective of the Project Act.

Such a conclusion is entirely consistent with the historical operation of the Bureau of Reclamation in the myriad projects which it has constructed throughout the arid West. Both by practice and by statute it has been the undeviating policy of the Secretary to allocate and provide for the delivery of water stored in Federally constructed reservoirs by contracts.[14] In the case of projects built under the Reclamation Law, the Secretary acquires the necessary water right for impounding water in storage reservoirs for the benefit of the ultimate users, but the rights to the stored waters *as between the Secretary and the contracting parties are fixed by contract.*

Thus, the Master's decision that the water delivery contracts constituted a contractual allocation of mainstream waters to Arizona and Nevada in the quantities specified in their respective contracts can be sustained both under the Project Act and the general Reclamation Law.

D. Nevada's Rights Under an Equitable Apportionment by the Court.

Nevada, as *parens patriae*, at the very inception of her intervention in this case premised her right to the beneficial consumptive uses of the waters of the Colorado River flowing within her

---

[13]Specifically, e.g., Section 46 of the Omnibus Adjustment Act of 1926, 44 Stat. 649, as amended, 43 U.S.C. Sec. 423e; Reclamation Project Act of 1939, Secs. 9(d) and 9(e), 53 Stat. 1187, 43 U.S.C. 85, as amended, 43 U.S.C. 485L(d).

[14]*Nebraska* v. *Wyoming*, 325 U.S. 589, 640 (1945).

boundaries upon the doctrine of equitable apportionment thereof among sovereign States of the Union as heretofore developed, sanctioned and applied by this Court.[15]

Nevada's position in this respect was outlined in its Opening Statement to the Master (Tr. 16152–16193) and thereafter fully submitted to him in Nevada's Briefs.[16] It may well be that this Court may decide the issues upon the equitable apportionment doctrine, particularly in view of the sovereign status of the parties; if so, every element of equity justifies an apportionment to Nevada at least as large as her contract amount.

California urges that the theory of an equitable apportionment is the proper theory for the disposition of this case. But she then distorts her argument into contending for a pure priority adjudication, even going to the extreme of saying that the word "equitable" as used in the statement is a mere word of art and does not bring into play the fundamental principles of equity as that term is customarily used. (California's Brief, pp. 52–64.)

A reading of the cases in which water has been apportioned among States by this Court indicates an almost diametrically opposite conclusion. It has been made clear in *Nebraska* v. *Wyoming*, 325 U.S. 580, 618, that all of the pertinent facts and circumstances affecting an apportionment must be taken into account. In that particular case, the Court made it clear that it was apportioning only natural flow water, and in that limited field followed substantially the priorities of appropriations in the respective States.

---

[16]Vol. II, Opening Brief, pp. 32–54, Answering Brief, pp. 15–27, Reply Brief, pp. 12–15.

But here, at the very outset, we find an entirely different circumstance. A judicial apportionment in this action must involve the apportionment of stored water. In fact, the principal water to be apportioned is that water stored behind Hoover Dam in Lake Mead and controlled and diverted by the other dams downstream. All of these are structures constructed by the United States and under the management and control of Federal officials. The Project Act authorizing the reservoir which is the source of the stored water which must be apportioned specifically provided that this storage water was to be disposed of by contract and not used by anyone unless the user had a contract. The same Act imposed specific limitations as to the quantities of this stored water which California might use.

Pursuant to this, contracts have been made (a) with the individual California users, (b) with the State of Arizona for a gross amount of 2,800,000 acre feet and with individual users in Arizona for their particular portions of this gross amount, and (c) with the State of Nevada for its 300,000 acre feet.

If the Court should make an equitable apportionment of the waters of the Colorado River, how can it ignore these contracts for stored water? It would seem that they are, of necessity, the basic yardsticks which the Court should use to determine the rights of the respective States as *parens patriae*. California, under any theory, cannot be awarded more than that to which she is entitled under her Limitation Act. The water which she must be awarded is her contract entitlement, subject to that limitation. She cannot be awarded water rights of any greater magnitude nor any other character.

Likewise, in the case of Arizona, if the Court is apportioning the waters of the Colorado River it must assume that Arizona is entitled to use out of Lake Mead the amount of water covered by her contracts with the Secretary. We cannot conceive that it

is the function of the Court in a judicial apportionment suit to either declare a contract such as this invalid, or to frustrate in any way its operation.

The same is true with respect to Nevada and its contracts totaling 300,000 acre feet of beneficial consumptive use out of Lake Mead. Since the Colorado River flows in a very deep and narrow canyon as it leaves Hoover Dam, the possibility of using, by direct diversion from the stream itself, any water in Nevada, other than a very small amount in the Fort Mohave area, is very remote.

The geography of the area and the basic economics dictate that Nevada must take substantially all of its water by pumping from Lake Mead. Even so, it is necessary to lift the water a thousand feet or more. Already, Nevada has constructed at great expense an initial pumping system, and is planning and studying for future development.[17] In apportioning the waters of the stream, the basic fact is that Nevada's water right can be only Lake Mead storage water.

It would seem that in making such a judicial equitable apportionment, the Court could not reduce Nevada's rights under her contracts with the Secretary unless they were found to be unfair or inequitable. There is nothing in this record even remotely hinting that such is the fact. As mentioned in her Opening Brief (p. 32), Nevada is unique among the States of the Lower Colorado River Basin in that there is no other possible source of water for the future development of Southern Nevada than the water from

---

[17]Since Nevada filed its Opening Brief, the Bureau of Reclamation has been authorized, and there has been made available to it, a $75,000 appropriation for F.Y. 1962 for a project study to commence July 1, 1961, to pump Lake Mead water to Eldorado Valley, Boulder City and Las Vegas Valley, including Nellis Air Force Base. The study will take three years to complete.

the mainstream of the Colorado. In testing the fairness of her contract rights, the needs of the State should be definitely taken into account. We will not repeat here the detailed discussions of these specific needs. They were set out in the Opening Brief, and particularly Appendix I, pp. 63–105.

For example, if Nevada were prevented from using the water which she is presently diverting from Lake Mead, the effect would be so disastrous as to even result in the forced migration of a part of the present population of the Clark County area. It is only with the knowledge that she will be entitled, from time to time, to increase her withdrawals up to her full contract amount that there can be any hope for an increased population in the area. To fix Nevada's water rights as proposed by California would be to create an absolute strangle hold on the future growth and development of Southern Nevada. Without water from Lake Mead, additional population cannot survive. It is not a question of comparative cost, nor is it in any way theoretical. It is simply the fact that to grow and expand Nevada must be entitled to take this additional contracted water from Lake Mead—its only possible source. No opportunity exists for developing underground water, for there is no more. No opportunity exists for converting salt or brackish water, as there is no such water available.

Certainly these vital factors must be taken into account in making an apportionment to Nevada which will permit a reasonable future growth. Nothing in the theory of judicial apportionment justifies what is, in effect, an economic block, or which, as California states, in effect, to Nevada: "We will let you complete the projects presently existing, but beyond that you can never go."

In testing California's demand that she so stop the growth and development of the State of Nevada by taking the water for use in California, we believe that the Court must take into account, along with many other factors, the question of whether or not

California has alternative sources of supply. California claims she is entitled to and must reduce the contract entitlements of Arizona and Nevada so she can take large quantities of water out of the Colorado River Basin into the great urban areas lying along the Pacific Coast. However, at the same time that she is urging this extreme doctrine in this case, at least two events are taking place which indicate there are other sources of water for this California region.

First, there is the great drive (almost a "crash" program) presently under way for the development of an economical process for the conversion of salt water for municipal use. In Nevada's Opening Brief (p. 34) reference is made to existing legislation to promote this program. Since then, legislation is pending, with full administration approval, to expand this program. A brief description of the pending legislation appears in Appendix I, pp. 68–70, *infra*.

The other imminent source of water for the region for which California cries disaster in its Brief is the so-called California Water Plan. There is a great surplus of water in Northern California. It is physically feasible to transport a large amount of this to the very regions in the south which are demanding Colorado River water. The people of California have voted $1,750,000,000 of bonds to finance this project, in accordance with the authorization contained in the "California Water Resources Bond Act," passed by the California Legislature in 1959. Brief reference is made to this legislation in Nevada's Opening Brief (p. 32). There is attached hereto as Appendix II, pp. 71–80, *infra*, a more detailed description of the scope of this legislation and of the facilities authorized to make water available to Southern California.

Along with the other California users the Metropolitan Water District is presently taking all needed water from the Colorado River. Everyone concedes that it will be many years, if ever,

before the Upper Basin develops its use up to the amount permitted by the Compact. Also, because of their size and cost, the projects by which Arizona and Nevada will use their allocations will require a number of years for completion. Because of this delay in uses by other States there will be ample time for the construction of the California Water Plan Project and of any necessary conversion plants, if the remote possibility ever develops that the uses allocated to the other States by the Master's Recommended Decree threaten to injure California. The Master explains why he believes this to be a remote possibility (Report, p. 102). The situations just discussed indicate other reasons why the contingency is extremely remote that there would ever be any disaster to California, or even limitation on her growth, for lack of water.

These are some of the factors this Court should consider in determining whether it would judicially authorize the taking from Nevada and the giving to California of the water covered in Nevada's contracts with the Secretary. Compared with California's total needs, the 180,000 acre feet which California seeks to seize from Nevada is relatively small. But to Nevada, this water is vital; to be deprived of it would indeed be a monumental catastrophe.

Among the provisions of the Recommended Decree are those providing that whenever there is not sufficient water available in any given year to supply the State allocations in full, the water shall be delivered on a pro-rata scale. This is accompanied by the further provision that those rights which could be classified as present perfected rights as of June 25, 1929, be first served, in their order or priority, even to the extent of ignoring State lines. It would seem that in this portion of the Recommended Decree the Master is making a judicial equitable apportionment of the water. Neither the Project Act nor any of the contracts provide for such proration in years of short water supply.

This is a fair and proper exercise of the judicial power. The incorporation of this provision in the Recommended Decree does not in any way infringe on any of the rights which California possessed after the completion of the reservoir. The provision giving protection to present perfected rights would give full protection to the Yuma, Palo Verde and Imperial rights of California. The effect of the proration, if any, upon California would fall upon her later rights, such as that of Metropolitan Water District. This District's Colorado River rights were obtained, and all of their facilities were constructed, with full knowledge of the provisions of the Project Act and the legislative history connected with its passage. Certainly, as sovereign States, Arizona, California and Nevada all stand on a parity, each with the other. The provisions for proration in short water years (especially since the older California uses are protected as present perfected rights) is a concrete expression of this rule of parity between States. It is a very effective and proper method of exercising the power of equitable apportionment by judicial decree.

III

COMMENTS ON CALIFORNIA'S BRIEF

A. Water Rights in Lake Mead.

Basic to the determination of this case is the ascertainment of the precise character, quality and quantity of the water right possessed by the Secretary, acting for the United States, to store water in Lake Mead. And the determination as to what, if any, rights in the river are superior to the right of the Secretary, acting for the United States, in connection with this reservoir. Strangely, the many voluminous briefs filed with the Master, and with this Court, have to date been rather silent on this point.

Obviously, to fill the reservoir the Secretary must have some sort of a water right. Once the gates in the dam were closed and

the storage of water began, then the water naturally flowing in the river at that point came under the control and management of the United States, acting through the Secretary. It changed its character. It became, instead of naturally flowing water, purely simply storage water.

This is not unusual, but on the other hand, a rather common occurrence in all of the arid Western States. We do not believe that it can be denied that in all States applying the appropriation doctrine any one constructing a reservoir must have a legal right to stop the flow of the river, impound it in his reservoir, and convert it into stored water. Of course, only water not already appropriated is ordinarily available for appropriation by the entity constructing the reservoir. By Section 8 of the Reclamation Act of 1902,[18] the Secretary was required to acquire water rights under State law for any projects to be constructed by him, and to recognize existing rights under State law in connection with projects constructed under the Reclamation Law. It has been the universal rule of the Secretary to do so in all projects in the United States *except* in the case of Hoover Dam and Lake Mead. *United States* v. *Gerlach Livestock Co.*, 339 U.S. 725, 740, 759–760 (1950).

Here, the Project Act authorized the construction by the Secretary of a reservoir of a capacity of not less than 20 million acre feet of water—equal to more than the usual annual flow of the Colorado River at that point. Such a reservoir could only be filled by preempting the flow of the Colorado River. That is exactly what has happened since the completion of Hoover Dam.

The Colorado River is admittedly a navigable stream. The Master pointed out (Report, p. 163) that the Congress stated in both Sections 1 and 6 of the Project Act that the improvement of navigation was enumerated as the first purpose of the dam and

---

[18] 32 Stat. 390, 43 U.S.C. 372, 383.

reservoir. Under the numerous and clearly applicable decisions of this Court under this set of circumstances the Secretary had the legal right to take into his possession sufficient flow of the river to create the planned storage. *Arizona* v. *California*, 283 U.S. 423 (1931); *United States* v. *Twin City Power Co.*, 350 U.S. 222 (1955); *United States* v. *Chandler-Dunbar Co.*, 229 U.S. 53 (1912); *United States* v. *Rio Grande Irrigation Co.*, 174 U.S. 890 (1899); *United States* v. *Appalachian Power Co.*, 311 U.S. 377, 426 (1940). And had the right to control the allocation and use of the water so impounded. *Ivanhoe Irrigation District* v. *McCracken*, 357 U.S. 275, 295 (1958); *United States* v. *Gerlach Livestock Co.*, 339 U.S. 725 (1950).

The history of the last 30 years has indicated that even though the Secretary has taken control of all water reaching Lake Mead, still he has not been able to accumulate adequate storage for all needs.

Again, reverting to the usual reservoir project constructed under general Reclamation Law, the stored water made available by the dams and reservoirs have been in every instance allotted to the water users, either directly or through their representatives (such as irrigation districts or water users' associations) by contract. This is made clear by the Court in *Nebraska* v. *Wyoming*, 325 U.S. 589, 640, where this Court stated:

> "All of the storage water is disposed of under contracts with project users and Warren Act Canals. It appears that under that system of administration of storage water no state and no water users within a state are entitled to the use of storage facilities or storage water unless they contract for the use."

These contracts provide the amounts of water to be delivered, the terms and conditions of delivery, payments, and other necessary details. In other words, once stored, the water has changed its character from normal flow, flowing in a stream available for

use by priorities, into a different character of water, namely, stored water available for use and delivery only by contracts with the United States, acting through the Secretary. In every instance, it has been the universal custom that the contracts for storage water for any given reservoir are of equal priority, and in times of shortage the owners of storage space share pro-rata.

There is nothing in the Project Act to indicate that Congress planned any other or different program with respect to the storage to be provided on the Colorado River. On the contrary, there is much to indicate that the Congress planned to follow exactly the historical pattern. It was provided in the first section that among the purposes of the reservoir was that of ". . . providing for storage and future delivery of the stored waters thereof . . ." In Section 5, the Secretary was authorized ". . . to contract for the storage of water in said reservoir and for the delivery thereof . . .;" that the "contracts representing water for irrigation and domestic uses shall be for permanent service . . ." And finally, as has been emphasized by the Master in his Report:

> "No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated."

Section 14 also provides:

> "This Act shall be deemed a supplement to the reclamation law, which said reclamation law shall govern the construction, operation, and management of the works herein authorized, except as otherwise herein provided."

Assessing this whole situation in the light of the historical pattern of the creation of reservoir water rights and the paramount and superior rights of the Federal Government under the navigation servitude on navigable streams, and the pertinent language in the Project Act, there can be no escape from the fact that: (1) The Secretary acquired a prior and superior right to all the waters

of the Colorado River for storage in Lake Mead, (2) that as a matter of law, this right was superior to the claim of any other rights on the river, even those preexisting,[19] and (3) that the water stored in the reservoir was thereafter available only to those having contracts with the Secretary therefor and subject to the terms and conditions of those contracts. The rights of California which she claims have been invaded or destroyed by the Master's Recommended Decree are contract rights for stored water and nothing more. As such, they are subject to all of the conditions and limitations of contracts made in accordance with the Project Act.

B. What Happened to the California Rights When Hoover Dam Was Constructed?

If we assume that as a result of the construction of the Congressionally authorized Hoover Dam, which had among its stated purposes that of the improvement of navigation, the Secretary acquired a right to store water sufficient to fill the reservoir, what happened with respect to the then existing California uses? If we accept this assumption, and if the Secretary required the entire flow of the river to fill the storage space he had created, then he had a right to take all the flow, regardless of any then existing prior uses.

The uses in California for which she claims priority, and whose priority is asserted to be destroyed by the provisions of the Recommended Decree should be separately analyzed for clarity in thinking.

---

[19]While Section 6 of the Project Act provides for the satisfaction of "present perfected rights" these rights are to be satisfied out of *storage* created by Hoover Dam and not from the *natural flow*. There is nothing in any of the California water delivery contracts which recognizes and preserves any *natural flow* rights. After storage was created by the construction of Hoover Dam normal flow rights as such ceased to exist.

California's oldest uses are those of the Palo Verde Valley totaling 120,560 acre feet[20] and of the Yuma Project, Bard District, amounting to 17,000 acre feet.[21] These uses of the natural flow of the river were always good in that the flow never dropped too low to supply them. They are given the first priorities in California's Seven-Party Agreement. They are in no danger of being diminished by any conceivable application of the Master's Recommended Decree. Not even California contends that these rights could be adversely affected. So that, in that respect, these particular California rights will not be affected one way or the other by the present proceedings.

The Yuma Project, a Federally constructed project, was a project under the control and supervision of the Secretary. There were existing individual water contracts whereby the Secretary had agreed to deliver water to the users on the so-called non-reservation portion of the project. The reservation division, being Indian lands, would be entitled to be supplied by the Secretary with the priority established under the so-called Winters' Doctrine (*Winters* v. *United States*, 207 U.S. 564 (1908)).

The right of the Palo Verde Irrigation District would probably not have any ground upon which to claim a priority over the right of the Secretary to store water in Lake Mead. However, an exact classification or definition of this right does not seem necessary in the disposition of this case because the Secretary has entered into a contract with this District for the full amount of its claim[22] and this contract includes, as do all of the

[21]Calif. Exs. 375 and 376, Appendix III, Nevada's Opening Brief, p. 110.

[22]Appendix 8, Report, p. 423.

California water delivery contracts, the intra-state priorities provided by the Seven-Party Agreement entered among the California claimants. By this agreement, Palo Verde Irrigation District is given the first claim to waters available to the State of California. There is not an iota of evidence in the record to indicate that either the right of the Palo Verde Irrigation District or that of the Yuma Project would ever be in any way diminished. In other words, there is no evidence of any stream flow so low but that these two uses would be fully supplied under any conceivable situation that might arise as a result of the Master's Recommended Decree.

There next comes the claim of the Imperial Irrigation District. There had been a use on this project of up to 2,807,000 acre feet by June 25, 1929.[23] By the Seven-Party Agreement, this project has a third priority among California claimants, and is a part of a total of 3,850,000 acre feet allotted collectively for irrigation uses as a first intra-state priority to the Palo Verde Irrigation District, the Bureau of Reclamation's Yuma Project and the Imperial Irrigation District. There is no more reason to believe that this project could have any priority as against the Secretary acting under the navigation power of the United States than in the case of the Palo Verde Irrigation District.

Many pages of the record herein describe the troubles and the vicissitudes which had long affected this water use. Several different diversion points had been tried, one after the other, to accomplish diversions. The Colorado River had, in one flood period, changed its course so that it flowed through the diversion canal and into the Salton Sea. This continued for several years,

---

[23]Calif. Exs. 270 and 273; Appendix III, Nevada's Opening Brief, p. 110.

and it was only after the expenditure of great sums of money that the river was turned back into its original channel. The threat of a repetition of this event hung over the Imperial Valley at all times.

In other years of low water there was insufficient flow in the river to fully supply the needs of the valley, particularly in the summer months. Great damage resulted from water shortage.

The waters of the Colorado River at this point were heavily laden with silt which caused tremendous difficulties at the diversion works and, at times, hindered or prevented the diversions.

So that, all factors considered, this use, prior to the construction of Hoover Dam, was a highly precarious one. If California could convert this to a contract right to take storage water out of a large reservoir, which reservoir would likewise control the flood and silting conditions, she had everything to gain and nothing to lose.

But even more important is the fact that the Project Act itself completely altered the situation with respect to the Imperial Irrigation District. As an integral part of the authorized project, the Secretary was authorized to construct a main canal located entirely within the United States connecting the Laguna Dam (a structure owned by the United States), or such other suitable diversion dam as the Secretary might select, for the Imperial and Coachella Valleys in California. It is further provided in Section 4(b) that before money was appropriated for, or construction work done upon the facilities for conveying water to the Imperial Valley there must be a contract insuring repayment of all costs in the manner provided in the Reclamation Law. Along with the construction of Hoover Dam, the Secretary constructed a new diversion dam (Imperial Dam) on the Colorado River, and the main canal and appurtenant structures leading therefrom

to the Imperial and Coachella Valleys. Subsequently, a contract was entered into[24] between the Secretary and Imperial Irrigation District for the delivery of water stored in Lake Mead through such works and for the repayment of the cost of construction of such works. Storage water has been supplied to the Imperial Irrigation District and Coachella Valley County Water District and delivered through such Federally constructed works constantly since their completion.

It would seem that as a result of the applicable legal principles, the construction of these works by the United States and the existing contracts, that the water rights of the Imperial Irrigation District are, and have been ever since the construction of the Hoover Dam, vastly different than they were prior to the passage of the Project Act. Of necessity, their water right, if one they had, also changed from a claim on the normal flow of the river to a supply from storage created and operated by the United States. It had become a supply provided for and regulated by a contract with the Secretary. The point of diversion from the river had been changed. Parenthetically it might be noted that there is no evidence indicating the State authorized a change in point of diversion as provided in State law, as would have been the required procedure if Imperial Valley were relying on old normal flow rights. The delivery is now through the All-American Canal instead of the District receiving back from Mexico the unused residue of the amounts previously diverted into and transported through Mexico. Because of these factors the Imperial Irrigation District presently has a vastly different type and character of water right and, in fact, a much more valuable one.

As a result of what might be generally described as these great

---

[24]Special Master's Ex. No. 4, Hoover Dam Documents, p. A595.

Federal subsidies, the Imperial Irrigation District was freed from the ever-present threats of destruction by flood and silting, from the danger of large Mexican diversions, or interference over which it could have no control, while the water was flowing through Mexico, and from the danger of late summer shortages of supply in low water years. More than any other entity, the Imperial Irrigation District profited as a result of the Federal expenditures in the construction of the great storage and regulating reservoir at Lake Mead, the Imperial Dam and the All-American Canal. The water rights resulting from this tremendous expenditure being evidenced by contract, the Imperial Irrigation District is not now in a legal position to object to a finding that its rights are contract rights and are a part of a statutory and contractual allocation. The doctrine stated in *Ivanhoe Irrigation District* v. *McCracken*, 357 U.S. 275, 295, is clearly applicable here.

A conclusion that the rights of the California users mentioned above, being all who were actually diverting and using water at the time the Project Act became effective, are now contract rights, is entirely in conformity with the provisions of Article VIII of the Compact wherein it was provided that, after storage equivalent to 5 million acre feet or more had been provided from the Colorado River in the Lower Basin, the claims by appropriators or users of water in the Lower Basin should attach to the stored water. The whole pattern of the Project Act providing for the storage of water by the Secretary and the delivery of the same pursuant to contracts is in accord with an interpretation of Article VIII of the Compact as meaning that thereafter the rights in the lower Colorado River would be evidenced by contracts for stored water, and not otherwise.

All of these rights being rights for water stored by the Secretary would be, under the generally accepted pattern of Western water law and under the practice of the general Reclamation

Law, of equal priority with other storage contracts executed by the Secretary for uses in either of the States of Arizona or Nevada. It is true that the California users had agreed among themselves as to an intra-state priority. But there has been no agreement by the States of Arizona or Nevada, or the users therein, as to any priority on the part of California.

The fact that the Master recommended the protection of present perfected rights as prior rights seems to Nevada to go even further in protecting the California rights than he was entitled to go. It would seem that the only protection given to present perfected rights was that given by the Compact, and the Compact applies only as between the Upper and Lower Basins. But in any event, with the protection given by the Recommended Decree to present perfected rights as between the States of the Lower Basin, the California users are given the maximum of protection. The Master's provision for a pro-rata division of the water in short years does not trespass upon any legal rights that any of the California users might have.

The foregoing discussion applies particularly to the rights which might be claimed to have been present perfected rights as defined in the Compact. The right of the Metropolitan Water District is given a later priority than those heretofore mentioned by the Seven-Party Agreement. It is the right which, according to California's Brief herein (pp. 266–277), would suffer the greatest in years of water shortage under the Master's Recommended Decree. But certainly it is not a right which is entitled to claim any priority interstate as against contract rights created by the Secretary with Arizona or Nevada. The Metropolitan Water District water right could not conceivably have been a present perfected right at the time either of the execution of the Compact or at the effective date of the Project Act. It was a claimed right of the exact type which the Compact negotiators had been

attempting to prevent from establishing priority. A determination was finally made as to the points of diversion from the Colorado River and of the location of the aqueduct from the river over the mountains to the coastal regions at some date later than June 25, 1929, according to California's Brief (pp. 125–126). The first contract with Metropolitan Water District was dated April 24, 1930.[25]

In any event, the Metropolitan's right is purely a contract right depending upon the contract between it and the Secretary. The diversion is made from Parker Dam, a structure constructed by and controlled by the Secretary. The water supply is out of the stored water of Lake Mead and not elsewhere. The supply has all of the characteristics of true stored water in that Metropolitan Water District is given the right to accumulate unused water for later use. There is nothing in the Project Act, or in the pattern of water law, or the long continuing practices of the Bureau of Reclamation, that would give the Metropolitan Water District contract any priority over other secretarial contracts with users in the States of Arizona or Nevada. We mention again the universal rule that contracts for storage water out of any given reservoir stand on a parity.

It would certainly be absurd to state that the Metropolitan Water District, which is relegated to a low priority intra-state among the California users, should have some sort of high priority as against Arizona and Nevada users. But, that is exactly the position taken by California in her violent protestation against the Master's decision as he found (a) that the Metropolitan right did not fit within the definition of present perfected rights, and (b) that there should be proration of shortages in low water years.

---

[25]Special Master's Ex. No. 4, Hoover Dam Documents, p. A499.

C. California's Repetitious Combination of Equitable Apportionment and Priority of Appropriation Invalid.

Another fundamental vice in the California argument is indicated by the strange and artificial phrase, endlessly repeated, that the foundation of her water rights is "equitable apportionment and priority of appropriation." Such a combination doctrine is utterly unknown in Western water law. Dividing the phrase into its two component parts, it is apparent that it is inconsistent on its face. The doctrine of appropriation as it grew up in the Western States, or the proposition that, as to water rights, the first in time is the first in right is, of course, so well defined and generally accepted as to be practically the "a, b, c," of Western water law. As mentioned by this Court,[26] and the Courts of practically every Western State, the doctrine of appropriation developed from the customs and usage of those who settled the arid west, first the miners and then the irrigators.

None of those people who thus, by their actions and customs, created the law of priority of appropriation ever heard, or even thought, of any doctrine of "equitable apportionment." In fact, the fundamental theory of the doctrine of priority of appropriation is the very antithesis of equitable apportionment. Under the appropriation doctrine, each user acquired the right to use and did use, when needed, all of the water necessary to fill his particular water right. He didn't share or apportion his water with anyone—equitably or otherwise. Of course this doctrine grew up on specific streams and in its adoption by the several States was only thought of as applying intra-state and in determining priorities of rights on specific streams or specific stream systems.

The principle of equitable apportionment, on the other hand,

---

[26] *Wyoming* v. *Colorado*, 259 U.S. 419, 459 (1922).

is purely a creation of the so-called interstate-international law evolved in determining disputes between the sovereign States.[27] It did not arise from any custom or usages of miners or irrigators, or any other users. Nor does it in any way depend upon any first in time, first in right priorities for its existence or even its application.

True, this Court, in determining certain controversies over the division of the natural flow of interstate streams between states, each of whom have applied the appropriation doctrine intra-state, has considered these priorities in making an equitable apportionment. But each time this Court has been very careful to state that these priorities created under State law are given effect across State lines only as one element of equitable apportionment, and has made it very clear that they are not always controlling, and, as a matter of fact, in the actual decisions, they have not always been accepted as completely controlling. A portion of the many and diverse factors to be taken into consideration in an equitable apportionment suit are enumerated in *Nebraska* v. *Wyoming*, 325 U.S. 580, 618, along with the statement that the list is not complete or exhaustive. This Court said:

> "That does not mean that there must be a literal application of the priority rule. We stated in *Colorado* v. *Kansas*, *supra*, that in determining whether one State is 'using, or threatening to use, more than its equitable share of the benefits of a stream, all the factors which create equities in favor of one State or the other must be weighed as of the date when the controversy is mooted.' 320 U.S. p. 394. That case did not involve a controversy between two appropriation States. But if an allocation between appropriation States is to be just and equitable, strict adherence to the priority rule may not be possible. For example, the economy of a region

---

[27] *Kansas* v. *Colorado*, 185 U.S. 125, 146–147 (1902).

may have been established on the basis of junior appropriations. So far as possible those established uses should be protected through strict application of the priority rule might jeopardize them. Apportionment calls for the exercise of an informed judgment on a consideration of many factors. Priority of appropriation is the guiding principle. But physical and climatic conditions, the consumptive use of water in the several sections of the river, the character and rate of return flows, the extent of established uses, the availability of storage water, the practical effect of wasteful uses on downstream areas, the damage to upstream areas as compared to the benefits to downstream areas if a limitation is imposed on the former—these are all relevant factors. They are merely an illustrative, not an exhaustive catalogue. They indicate the nature of the problem of apportionment and the delicate adjustment of interests which must be made."

The oft-repeated statement throughout the California Brief that they have "rights under equitable apportionment and the appropriation doctrine" are complete misnomers, are of no value and tend only to mislead. If the California water users acquired any priorities intra-state, they acquired them as appropriators, and not otherwise. To what extent they may be increased, diminished, or altered, by the application of the doctrine of equitable apportionment will result, if at all, for the first time from the determination of this action.

Accordingly, clarity of thinking requires rejection of the phrase "equitable apportionment" in assessing the amount and character of the California rights at the time of the passage of the Project Act, and the extent and character of those rights as they now exist, after the construction of Hoover Dam and all of the other structures by which the United States has taken physical control of all of the waters of the main Colorado River from Lake Mead to the Mexican Boundary.

D. "Present Perfected Rights," a Unique Descriptive Phrase, is Strongly Applied in California's Favor.

Those who drafted the Compact used a very precise and unusual definition of the rights which were to be unimpaired thereby. In Article VIII, first sentence, it is stated:

> "Present perfected right to the beneficial use of waters of the Colorado River System are unimpaired by this compact."

This is a definition unique in water law. It is not one that has been customarily used in referring to water rights of any kind or variety. It must be assumed that in using this unique language, the authors of the Compact had a definite and precise purpose in mind. Elsewhere (even, in fact, in the succeeding sentence) reference is made to the rights of "appropriators" or "users." So that where the reference was to present perfected rights, a very clear and distinct description, we think that the meaning must be that which was ascribed to it by the Master in his Report (pp. 307–308). In other words, it did not cover claims which were only, in effect, paper rights. That is, where initial steps had been taken under State law to make appropriations, but which were so new that the works had not been completed and no water had been applied to beneficial consumptive use. Nor did it cover unused portions of large claimed rights, a part only of which actually had been applied to a beneficial consumptive use, such as was the case of the Imperial Valley claim.

So far as the Compact is concerned, there was not being guaranteed to California any greater water use than the total of three then existing uses. It can, of course, be argued as to whether California users had *any* rights in the waters of this navigable stream as against the United States as mentioned, *supra*, p. 33. It can also be argued, as was done strenuously by Arizona in the early phases of this case, as to the real extent and validity of the Imperial Valley rights under the physical conditions then

existing. That is, where the actual diversions of the Colorado River were taken into Mexico, a considerable amount of the water was used in that foreign nation, and then a part returned northerly across the border into the Imperial Valley.

But in any event, ignoring any and all questions as to their validity, the total of these rights, i.e., 2,944,560 acre feet is the *most* that California could claim as a then existing priority.

It should be noted that there is no indication that the amount of these then existing rights would be affected by the Master's Recommended Decree. In other words, the allegedly "prior" rights which California insists will be destroyed are rights other than those actually in being at the time of the execution of the Compact.

In the interim, between the execution of the Compact in 1922 and its effective date, June 25, 1929, first steps were taken toward making an appropriation of water for use by the Metropolitan Water District, consisting purely of primary surveys and of an initial paper appropriation under California law. At the time that the Project Act was passed, neither the right of the Metropolitan Water District, nor any other subsequent claims for California uses, were anything more than paper filings. No construction work was started on the Metropolitan Water District right until after the effective date of the Project Act. In fact, California argues in its Brief (pp. 125–126) that as late as 1930 consideration was still being given to a proposal to divert the Metropolitan Water District from a point on Lake Mead above Hoover Dam. The actual diversion point eventually chosen was at Parker Dam, many miles downstream from the Hoover Dam. In other words, the California argument concedes that, until a time subsequent to the effective date of the Project Act, the point of diversion and plan of conveyance for the Metropolitan Water District was still an uncertainty.

It has always been the position of the State of Nevada that the present perfected rights protected by the Compact were those in existence at the date of its execution. Obviously, these could be the only rights of which the negotiators of the Compact would have knowledge. It seems absurd to believe that they would be attempting to guarantee rights which might have later inception. The very purpose of the Compact was to protect the more slowly developing States against "grabs" of water by the rapidly developing States.

If the rights which are protected by the Compact and the Project Act are those "present perfected" as of the date of its execution on November 24, 1922, California had no other rights than those for Palo Verde, the Yuma Project and the then existing uses in the Imperial Irrigation District. The Master was of the opinion that the Compact could speak only of its effective date and that, since this was June 25, 1929, when President Hoover issued his proclamation, the present perfected rights are those existing on that date. As against California's claim, it would seem that this variation between 1922 and 1929 is not important. As above mentioned, no California rights had been created in that interim period except by initial paper filings. There were no additional or new actual uses which could come within the definition of present perfected rights. The claims of the Metropolitan Water District were still very definitely inchoate and unperfected.

Of course, this situation is the background which compelled California to argue (California's Brief, pp. 38, 57–58) concerning the doctrine of relation under which, in the Western States, it has been provided, either by statute or custom, that after a water right was initiated, its priority date relates back to the date of such initiation if the work of completing it has been diligently pursued to completion and application of the water to beneficial use. But that rule is wholly irrelevant here, where the specific description of present perfected rights was used in lieu of the

description of "appropriations" or "appropriators." The words are clear, precise and unambiguous and when that is accepted, much of the ambiguity and confusion ascribed to the Master's Report by California completely disappears.

E. A Finding as to Dependable Water Supply is Not Necessary and, in Fact, Cannot be Made.

California devotes a large portion of her Opening Brief (Part Five, pp. 232–277) to an argument which might be briefly summarized as a contention that unless there is a determination of the dependable water supply of the Colorado River there is no justiciable controversy. Nevada urges that this entire argument is fallacious from a number of points of view. As pointed out foregoing, the real *res* of this action is the body of stored water in Lake Mead. This water resulting from the construction by the United States of a great dam under the management and control of the Secretary has been contracted to various entities as has been described in detail.

For decades a controversy has raged, particularly between Arizona and California, as to the meaning, effect and validity of these contracts; and particularly as to their place in the distribution of Colorado River water among the three States of the Lower Basin. This is the justiciable controversy long recognized by all.

It does not in any way depend upon a finding as to the dependable supply. The controversy is there, regardless of the extent of the supply. And, as the Master pointed out, this expanding great Southwest area cannot progress unless the rights of the parties are determined.

As to the possibility of making a finding such as that requested by California, it would seem that obstacles are insurmountable. Nevada, confronted with the fact that both Arizona and California had introduced much evidence on water supply, endeavored

with the assistance of expert engineers to present some findings on this facet of the case in her Briefs before the Master.[28] The only conclusion that she could then reach was that a finding could be made prorating among the States six million acre feet so that California would get 4,400,000 acre feet of that water, and then in turn prorating the balance. The Master has arrived at a different but a quite similar conclusion.

His determination that the contract rights of the State are valid, that in times of shortage the supply will be prorated and that present perfected rights will be protected even across State lines is a very fair and reasonable solution of the problem. There are many reasons why a determination of the dependable supply cannot be made. No one can determine the future Upper Basin uses. The exact method of computing the contributions of the various States to the Mexican Treaty deliveries cannot be determined in absence of the Upper Basin States. The water supply record is for a very short period, having in mind the problem, and much of it undependable. The situation is entirely different from that confronting engineers desiring to make a water supply study for a proposed project. For there calculated risks can be taken. But any finding here which would endeavor to determine a water supply in perpetuity would be an impossible task. Any and all studies are just as good as the assumptions upon which they are based. And a determination of the proper assumptions to make for such a study, and their validity, would involve the Court in an endless task. We submit that the Master was correct in not attempting any such finding and that such a finding is entirely unnecessary.

IV

COMMENTS ON UNITED STATES' BRIEF

In Exceptions I and II (United States Brief, Points I and II, pp. 7–21), the United States takes the position that the Secretary is authorized to make deductions for upstream tributary uses in Arizona and Nevada from the amounts to which these States are entitled to have delivered from storage in Lake Mead under their water service contracts with the United States.

More specifically, the United States takes the position that the Master's determination is erroneous in holding that the provisions of Article 7(d) of the Arizona contract[29] and the provision in Article 5(a) of the amended Nevada contract,[30] which charges tributary use in these states against the contract amounts to be delivered from storage in Lake Mead, are in violation of the Project Act and unenforceable.

---

[29]Article 7(d) provides: The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead, and such obligation shall be subject to such reduction on account of evaporation, reservoir and river losses, as may be required to render this contract in conformity with said compact and said act.

[30]Article 5(a) provides: Subject to the availability thereof for use in Nevada under the provisions of the Colorado River Compact and the Boulder Canyon Project Act, the United States shall, from storage in Lake Mead, deliver to the State each year at a point or points to be selected by the State and approved by the Secretary, so much water, including all other waters diverted for use within the State of Nevada from the Colorado River system, as may be necessary to supply the State a total quantity not to exceed Three Hundred Thousand (300,000) acre-feet each calendar year. Said water may be used only within the State of Nevada, exclusively for irrigation, household, stock, municipal, mining, milling, industrial and other like purposes, but shall not be used for the generation of electric power.

The Master states three principal reasons why Article 7(d) of the Arizona contract and that provision in Article 5(a) of the amended Nevada contract charging tributary uses are in violation of the Project Act and are unenforceable (Report, p. 237):

(1) Since Section 5 of the Project Act[31] requires contracts for permanent service, the contract provisions referred to above would be in violation of this Section.

To illustrate, the Master uses as an example: Assume that annual delivery from Lake Mead aggregated the full contract allotment of 300,000 acre feet. If, thereafter, a consumptive use from the Virgin River System reduced the inflow into Lake Mead by 50,000 acre feet, the Secretary's obligation under the Nevada contract would be reduced by this amount. This would result in cancellation of deliveries to the junior-most Nevada users who had been receiving the last 50,000 acre feet under the contract. For these junior Nevada users, as the Master correctly points out, the contract cannot be regarded as one for permanent service and therefore it is violative of Section 5 of the Project Act.

The Master also points out (Report, pp. 239–240) that these provisions charging Arizona and Nevada for tributary uses above Lake Mead would "generate new causes of uncertainty . . ."; that the provisions charging Arizona and Nevada for depletions above Lake Mead "created this very uncertainty of supply that

---

[31]The pertinent portions of Section 5 are: That the Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon, for irrigation and domestic uses, * * *. Contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to paragraph (a) of Section 4 of this Act. No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated.

Hoover Dam and the Section 5 command were explicitly designed to avoid."

The Master finally points out (p. 240) that since Section 5 admittedly deals only with the mainstream, it must have intended to require permanent service in regard to mainstream deliveries regardless of consumption on the tributaries.

The United States argues that there is no inconsistency between these provisions and the "permanent service" requirement of Section 5 of the Project Act (p. 15, United States' Brief). The United States argues, using the Master's example, that if the use of the contract right for 300,000 acre feet preceded in time the upstream appropriations "there would not be permitted any diversion upstream that would interfere with the senior contract use, and thus there would be no occasion for any reduction of delivery under the contracts and no impairment of their permanence. The flaw in the United States' answer is that it completely overlooks the fact that the Secretary admittedly has no control over consumptive uses on the Virgin River or any other tributaries in Nevada, and has no control whatsoever on whether uses on the Virgin River System under State law shall be permitted or not permitted.

(2) The Master also points out (Report, p. 240) that these contract provisions also violate Section 18 of the Project Act[32] which provides in effect that State law shall govern water rights and priorities intra-state.

Using the same example regarding use on the Virgin River

---

[32]Section 18 provides: Nothing herein shall be construed as interfering with such rights as the States now have either to the waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters within their borders, except as modified by the Colorado River compact or other interstate agreement.

under the law of prior appropriations, the project would be junior to all users of the 300,000 acre feet. But the contract provisions, if enforced, would reverse this order of priority. The users of the last 50,000 acre feet of mainstream water under the Nevada contract would be deprived of water, while the Virgin River users would continue, despite the fact that the tributary users under State law were junior to the mainstream users. This, obviously, would be a flagrant violation of Section 18. The Master correctly points out that the Secretary has attempted, by the provisions in these contracts, to intervene within the States of Nevada and Arizona to dictate who shall receive water and in what order of priority. Moreover, in this attempt, as he points out, the Secretary has adopted a rule of priority exactly the reverse of the State rules; the contract provisions would displace senior downstream users for the benefit of junior upstream users.

The answer the United States makes (p. 18, United States' Brief) is to repeat that junior upstream diversions would not be permitted if 300,000 acre feet of Lake Mead was being used; a matter, we repeat, over which the Secretary has absolutely no control.

(3) In addition to violating Sections 5 and 18 of the Project Act, the Master cites a third reason why these contract provisions are invalid and unenforceable. Articles 7(d) and 5(a) are inconsistent with the Section 4(a) limitation on California's use of mainstream water, and would result in an allocation out of harmony with the California limitation, and, indeed, would defeat the basic purpose of the delivery contracts themselves (p. 241). How this would operate is explained fully in the Master's Report (pp. 241–247), and will not be repeated here. This is demonstrated clearly by another example used by the Master. He said (p. 242):

"The resulting incomplete allocation may be demonstrated

by the following example: Assume that the Secretary decided to release in a particular year enough mainstream water to permit consumption of 7.7 million acre-feet in the three states. Assume, also, that Arizona's diversions from the Little Colorado River depleted the flow into Lake Mead by .1 million acre-feet. Under the interstate apportionment established by the Section 4(a) limitation on California and the delivery contracts with Arizona and Nevada, of the first 7.5 million acre-feet of mainstream consumption, Arizona would be allocated 2.8 million acre-feet, California 4.4, and Nevada .3. Of the .2 million acre-feet constituting surplus, Arizona and California would be each allocated one-half. Thus to California would be apportioned a total consumption of 4.5 million acre-feet for the year in question. She could not consume more than this amount because of the Section 4(a) limitation, which is based on mainstream considerations only. To Nevada would be apportioned a total consumption of .3 million acre-feet, and she could not utilize more than this since that constitutes her full contractual allotment. To Arizona would be apportioned a total consumption of 2.9 million acre-feet. But if Article 7(d) of her contract were applied in this situation, the Secretary's delivery obligation of 2.9 million acre-feet would be reduced by the amount of the depletion of the flow into Lake Mead, and Arizona could consume only a total of 2.8 million acre-feet from the mainstream. Thus, although 7.7 million acre-feet were released for consumption within the three states for the year, only 7.6 million acre-feet could be utilized under the statutory and contractual limitations. 100,000 acre-feet of water released for consumption could not be used."

The United States makes no reply; it merely states that it does not agree with this conclusion. It suggests that the 100,000 acre feet of Little Colorado River depletion is a part of the total mainstream supply for allocation. The frailty of the suggestion of the United States is that it would do violence to the interpretation of Section 4(a) adopted by the Master, the interpretation

to which the United States itself agrees. The Master's interpretation of Section 4(a) limits California to 4.4 million acre feet, plus one-half the surplus from the *mainstream*. The Master's interpretation establishes a mainstream, not a system-wise method of accounting. The suggestion of the United States would import tributaries or system water into the Section 4(a) limitation. Articles 7(d) and 5(a) would defeat this mainstream allocation otherwise completely provided for in the contracts by introducing system considerations in a mainstream apportionment. These provisions are not in harmony with a mainstream apportionment and, as the Master points out, would leave some mainstream water undisposed of.

Essentially, the answer comes down to this: Was the Master correct in holding that Congress intended by Section 4(a) of the Project to confine mainstream water to water stored in Lake Mead and flowing in the mainstream below Hoover Dam, and that California is limited to 4,400,000 acre feet of the first 7,500,000 acre feet of mainstream water. If the Master was correct, it inevitably follows that he was correct in excluding tributary uses above Lake Mead.

Nevada respectfully submits that there is nothing in the Brief of the United States which seriously challenges the soundness and correctness of the Master's decision.

In addition, there are reasons other than those relied upon by the Master why his decision that Article 7(d) of the Arizona contract and the provision in Article 5(a) of the Nevada contract charging tributary uses are unenforceable, is proper and sound.

The legislative history of Section 4(a) of the Project Act demonstrated clearly that Congress intended that Nevada should have 300,000 acre feet of consumptive use of the mainstream. There is nothing in the legislative history even remotely suggesting that this amount should be reduced by tributary uses in Nevada above Lake Mead.

The legislative history of Section 4, which is reviewed by the Master in establishing that Congress intended that the first 7,500,000 acre feet to be allocated to the three Lower Basin States was mainstream water (Report, pp. 173–185), makes it abundantly clear also that the 300,000 acre feet to be allocated to Nevada from the mainstream was not to be diminished by any tributary uses in Nevada. In reviewing the legislative history, the Master said (Report, p. 174):

> "Certainly Congress intended that the water, to a portion of which California was limited by Section 4(a), would be mainstream water only. The very language of the Section—it refers to the Colorado River and not to the System—points in this direction. But more important, the second paragraph of Section 4(a) demonstrates that Congress considered the limitation on California to be part of an overall allocation of the entire quantity of water dealt with in that Section among three states only: of the first 7.5 million acre-feet—4.4 to California, 2.8 to Arizona, and .3 to Nevada; the balance to California and Arizona equally. This intention is clearly stated in the legislative history."

Senator Pittman of Nevada made it perfectly clear that Section 4(a) of the Project Act was designed by Congress to apply only to the mainstream, and that Nevada's share of that water from the mainstream was 300,000 acre feet.

> "The Senate has already determined upon the division of water between those States. How? It has been determined how much water California may use, and the rest of it is subject to use by Nevada and Arizona. Nevada has already admitted that it can use only . . . 300,000 acre-feet. That leaves the rest of it to Arizona. As the bill now stands it is just as much divided as if they had mentioned Arizona and Nevada and the amounts they are to get . . ."[33]

---

[33] 70 Cong. Rec. 468 (1928), Ariz. Legis. Hist. p. 80.

This statement by Senator Pittman obviously reflected the understanding of Congress that of the first 7,500,000 acre feet of water in the mainstream, California would be entitled to 4,400,000, Arizona 2,800,000, and Nevada 300,000. Senator Pittman confirmed this when he concluded that:

> "Arizona today has practically allocated to it 2,800,000 acre feet of water in the main Colorado River."[34]

This is confirmed also by the recommendations of the Governors' Conference in 1927. Its proposed settlement was considered at length by the Senate in the debate on the fourth Swing-Johnson bill.

The Governors of the seven Colorado River States met in 1927 in an attempt to bring about the seven-state ratification of the Colorado River Compact. The Governors of the Upper Division recommended by a resolution adopted by them at that conference that out of the average annual delivery of water to be provided by those States at Lee Ferry under the Compact, there would be apportioned to Nevada 300,000 acre feet, to Arizona 3,000,000 and to California 4,200,000 acre feet. They further recommended that each Lower Basin State should have exclusive use of all water of the Colorado River tributaries within its boundaries above the place where that water emptied into the mainstream.[35] The division finally patterned upon by the Congress was that recommended by the Governors' Conference, except that California was raised to 4,400,000 acre feet and Arizona was reduced to 2,800,000 acre feet.

With respect to the Governors' Conference recommendation, as to tributary uses, Senator Hayden commented (80 Cong. Rec. 171):

---

[34]70 Cong. Rec. 469 (1928), Ariz. Legis. Hist. p. 82.

[35]70 Cong. Rec. 172, Ariz. Legis. Hist. 33–34. 69 Cong. Rec. 10259, Ariz. Legis. Hist. 14.

"The governors at Denver went on further and stated, in addition:

2. To Arizona, in addition to water apportioned in subdivision (b), 1,000,000 acre-feet of water to be supplied from the tributaries of the Colorado River flowing in said State, and to be diverted from said tributaries before the same empty into the main stream. Said 1,000,000 acre-feet shall not be subject to diminution by reason of any treaty with the States of Mexico, except in such proportion as the said 1,000,000 acre-feet shall bear to the entire apportionment in (1) and (2) of 8,500,000 acre-feet.

3. As to all water of the tributaries of the Colorado River emptying into the river below Lees Ferry not apportioned in paragraph (2) each of the states of the lower basin shall have the exclusive beneficial consumptive use of such tributaries within its boundaries before the same empty into the main stream, provided, the apportionment of the waters of such tributaries situated in more than one State shall be left to adjudication or apportionment between said States in such manner as may be determined upon by the States affected thereby.

That last provision referred particularly to the Virgin River, which was partly in Utah, partly in Arizona, and partly in Nevada, the only important tributary that is a stream of interstate character."

The foregoing is further affirmative evidence that tributaries uses in Nevada above Lake Mead are not to be deducted from the 300,000 acre feet allocated to Nevada from the mainstream.

We repeat, a careful study of the legislative history of Section 4(a) does not disclose even the most remote suggestion that Nevada's share of 300,000 acre feet from the mainstream should be reduced by tributary uses in Nevada.

Another reason was advanced in Nevada's Briefs before the Master (Reply Brief, pp. 10–11 and also in Nevada's Opening Brief herein, p. 48), why the provision in Article 5(a) of the

amended Nevada contract charging tributary uses is invalid and unenforceable. There is nothing in the Project Act that authorized, directed or permitted the Secretary to limit Nevada's allocation of water from Lake Mead by deducting therefrom tributary uses in Nevada. Nor could any act of any Nevada official in signing such a contract be deemed to be a waiver or release of any rights which that State, as a sovereign, possessed. It is fundamental that State officials do not have any power to surrender, abrogate, release or dispose of any of the rights of a sovereign State. Such acts would be *ultra vires*. Accordingly, from all aspects, the provision in Article 5(a) of the Nevada contract purporting to reduce Nevada's allocation of 300,000 acre feet from Lake Mead would be *ultra vires*, void and unenforceable.

One further point should be mentioned. Arizona, while agreeing with the United States that the Project Act constitutionally delegates to the Secretary the power to allocate mainstream water among the Lower Basin States, took the position before the Master that the second paragraph of Section 4(a) established a formula for the allocation of the water of the mainstream among the three Lower Basin States which the Secretary is required precisely to follow, and that those provisions in the water delivery contracts both in Arizona and Nevada, which deviated from the formula are void. Arizona's contention in this respect was rejected by the Master (Report, pp. 162–163).

Arizona excepted from the Master's ruling in this respect (Arizona Exception No. 7) and devotes Part III of its Brief (pp. 83–104) in support of its position. By Article 4(a), Arizona argues, Congress made an over-all allocation of the entire quantity of the mainstream of the Colorado River dealt with therein by establishing a formula under which the first 7,500,000 acre feet of that water should be divided in an amount not to exceed

4,400,000 to California, 2,800,000 to Arizona, and 300,000 acre feet to Nevada, and the surplus above 7,500,000 acre feet to California and Arizona equally, to which the water delivery contracts made by the Secretary are required to conform.

In the event this Court should concur in Arizona's view, this would provide an additional reason why that provision in Article 5(a) of the Nevada amended contract charging tributary uses is void and unenforceable.

The formula of Section 4(a) of the Project Act entitles Nevada to the delivery from Lake Mead for use in Nevada of 300,000 acre feet per annum. Under Article 5(a), however, there is to be subtracted from the 300,000 acre feet "all other water diverted for use within the State of Nevada from the Colorado River System." Obviously this does not conform to the Section 4(a) formula, and hence, if Arizona is correct, is beyond the authority of the Secretary and is unenforceable.

In Point IV, the United States excepts to the statement of the Master at page 210 of his Report that:

> "It should be noted that the Nevada contract, unlike the Arizona contract, does not require additional subcontracts between each water user and the Secretary of the Interior. On the contrary, the State of Nevada is free to determine who shall use the water, subject only to the Secretary's approval of the points of diversion."

and requests this Court to reject this statement.

This, likewise, was the subject of an exception by Nevada. Nevada requested that Paragraph II(B)(7) of the Recommended Decree be amended so that the phrase "mainstream water should be delivered to users in * * * Nevada only if contracts have been made by the Secretary of the Interior pursuant to Section 5 of the Boulder Canyon Project Act for the delivery of all

such waters; * * *", conforms to the conclusion which the Master makes with respect to this contract on page 210 of his Report.

We believe that Nevada's argument in support of its exception in Nevada's Opening Brief (pp. 52–55) is a complete answer to the United States and will not be repeated here.

It may be added additionally that the major position of the United States, in excepting to the Master's statement on page 210, is that it is inconsistent with Article 5(a) of the Nevada contract providing that the United States shall annually deliver from storage in Lake Mead:

> "So much water, *including all other waters diverted for use within the State of Nevada from the Colorado River System*, as may be necessary to supply the State a total quantity not to exceed Three Hundred Thousand (300,000) acre feet each calendar year."

The United States says, at page 50:

> "The underscored language excludes from the agreement to deliver 'to the State' all other diversions for use within the State. Such exclusion preserves the Secretary's authority to contract with users in Nevada and precludes the possibility of an attempted waiver of the Section 5 requirement for contracts with all users."

If the Master is correct in holding that the underscored part of Article 5(a) is contrary to Section 5 of the Project Act and is unenforceable, and we submit that he clearly is correct (*supra*, pp. 50–59), then, of course, the argument of the United States is completely groundless.

The Nevada contract is entirely consistent with Section 5 of the Project Act. It is senseless to require additional subcontracts between each water user and the Secretary. This contract was drafted in the light of circumstances peculiar to Nevada. Existing

and future uses of Lake Mead water will be for industrial and municipal uses (Appendix I, Nevada's Opening Brief). It would be ridiculous to require individual and duplicate contracts with industrial and municipal users of Lake Mead water. There are not now and never will be any large irrigation projects such as there are in Arizona and California. It is logical and sensible that the water delivery contracts be with the State of Nevada, acting through its Colorado River Commission of Nevada. This Commission was created primarily for this purpose and is consistent with Section 5 of the Project Act. Specifically, NRS 538.160 authorizes the execution of a contract such as that involved in this action. Section NRS 538.170 authorizes the Commission to receive the water covered by the contract for the State of Nevada and to make necessary appropriations therefor, and NRS 538.180 authorizes the Commission to make all necessary leases, subleases, or contracts of sale of the water obtained through the contract with the United States (Appendix II, Nevada's Opening Brief).

The United States appears to be concerned about the use of Lake Mead water on Federal projects. In the event any Federal projects are authorized, which is extremely unlikely, it would be a simple matter indeed for the State of Nevada, acting through its Colorado River Commission of Nevada, to relinquish to the United States sufficient water for the Federal project or to contract directly with the irrigation district or company operating the project.

V

COMMENTS ON ARIZONA'S BRIEF

Arizona's Brief is divided into two parts. Part I deals with the "Controversy Among Arizona, California and Nevada with Respect to Mainstream Water," and Part II deals with the "Claims of the United States to Water." Inasmuch as Part I

supports the Master's Report and Recommended Decree in all the essential details, we are in general agreement with the position taken by Arizona, except as hereinafter noted.

We concur in Arizona's argument in Point I of Part II (pp. 32–57) that Congress, in enacting the Project Act, exercised its plenary power over navigable waters and allocated among Arizona, California and Nevada all available water in Lake Mead and in the mainstream of the Colorado River downstream from Lake Mead. If this is true, the principle of equitable apportionment and priority of apportionment is not applicable to the division of mainstream water among those States.

We concur generally with the Arizona argument in Point II of Part I (pp. 57–82) that the Project Act provides for the storage of mainstream water only and for its allocation among Arizona, California and Nevada. Arizona, however, argues that the Compact apportioned only mainstream water. The Master did not concur with Arizona's interpretation of the Compact and construed Article III(a) of the Compact as dealing with both the mainstream and tributaries; that Article III(a) deals with the Colorado River System which is defined in Article II(a) as including the entire mainstream and the tributaries (Report, pp. 142–151, 173). Nevada, in its Brief before the Master, concurred in the Master's view (Nevada's Answering Brief, pp. 28–40).

Nevada, however, makes no issue of the matter at this time. Whether this Court concludes that the Master was correct in construing Section 4(a) of the Project Act and the California Limitation Act as referring only to water stored in Lake Mead and flowing in the mainstream below Hoover Dam, or whether the Court concurs with Arizona's view that the Compact apportioned only mainstream water, the result so far as Nevada's rights are concerned would be the same. Nevada would still be

entitled under its contracts to an undiminished 300,000 acre feet of water from Lake Mead.

In Point III of its argument under Part II (pp. 83–105), Arizona, while agreeing with the Master that the Project Act constitutionally delegated to the Secretary the power to allocate mainstream water among the three Lower Basin States, argues that the second paragraph of Section 4(a) established a mandatory formula for the allocation which the Secretary is required precisely to follow in the water delivery contracts, and that those clauses in her water delivery contract which deviated from the formula are void.

Under this theory, one of the clauses in the Arizona contract which would be void is Article 7(f) which provides for the recognition by Arizona of the right of the United States and the State of Nevada to make a contract for the "use of 1/25 (one twenty-fifth) of any excess or surplus water available in the Lower Basin and unapportioned by the Colorado River Compact, which waters are subject to further equitable apportionment after October 1, 1963, as provided in Article III(f) and Article III(g) of the Colorado River Compact."

Nevada emphatically disagrees with Arizona's contention that Article III(f) is void, and submits that it is valid and enforceable. The Master effectively disposes of Arizona's contention in the following language (p. 163):

> "This argument is premised on the language in Section 5 that 'contracts respecting water for irrigation and domestic uses . . . shall conform to paragraph (a) of section 4 of this act.' The second paragraph, Arizona points out, is included within Section 4(a). But the second paragraph of Section 4(a) is plain in that it merely authorizes a tri-state compact for the division of water; it does not compel it; nor does it condition approval of the Colorado River Compact upon acceptance of the proposed tri-state compact.

> Indeed, the second paragraph was specifically amended on the floor of the Senate to make the suggested division permissive rather than mandatory. The suggested compact which Congress was willing to approve in advance is of no compelling force or effect since no such compact has ever been agreed to. In so far as Section 5 refers to the second paragraph of Section 4(a) it is for the purpose of requiring the Secretary to respect the compact if ratified by the states. See also Section 8(b). Arizona's contention in this respect must therefore be rejected."

Certainly Nevada is entitled to its equitable share of any excess or surplus available in the Lower Basin. This is specifically provided for by Article III(f) of the Compact. It provides:

> "(f) Further equitable apportionment of the beneficial uses of the waters of the Colorado River System unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October first, 1963; if and when either Basin shall have reached its total beneficial consumptive use, as set out in paragraphs (a) and (b)."

If Arizona's contention is correct, and the excess or surplus is divided 50 percent to Arizona and 50 percent to California, Nevada would be deprived of its equitable share, contrary to the express terms of Article III(f) of the Compact. Nevada submits that Article 7(f) of the Arizona contract is valid and in full force and effect, consistent with the findings of the Master (Report, p. 207).

In the unlikely event that this Court should find Article 7(f) of the Arizona contract is void, then Nevada submits that that part of the Recommended Decree (Paragraph II(B)(2); Report, p. 347) permitting Nevada to contract with the United States for 4 percent of the excess or surplus should be retained irrespective of any provisions of the Arizona contract. Nevada's

right to an equitable share of the excess or surplus is not dependent upon any recognition or consent by Arizona in its contract or otherwise.

Part II of Arizona's Brief is an excellent argument in opposition to the views expressed by the Master with respect to the unrestricted right of the United States to reserve water for all Federal establishments. As Arizona correctly points out, the Master, relying basically on a single decision of this Court (*Winters* v. *U.S.*, 207 U.S. 564), which involved the reservation of water of a non-navigable stream for use on an Indian reservation created by treaty in the Territory of Montana, has concluded that the Federal Government has the unrestricted power to reserve water of both navigable and non-navigable streams for the benefit of all Federal establishments. Arizona points out, also, that the Master fails to recognize the distinction between the legal principles applicable to navigable waters and those which govern non-navigable streams. He fails to give effect to the well-established rule that when a State is admitted to the Union, dominion over its navigable water passes from the United States to the newly created State and that, thereafter, the Federal Government is without power to reserve the water of a navigable stream for use on Federal establishments, since its only authority over such water is that which is vested in it by the Commerce Clause and the treaty-making provisions of the Constitution (Arizona's Brief, pp. 117–118).

Nevada agrees fully with Arizona's presentation on this issue. It is one of far-reaching importance throughout the entire West.

CONCLUSION

Nevada submits that it is entitled to the beneficial consumptive use of 300,000 acre feet of water stored in Lake Mead under any theory which may be adopted by this Court. This is true whether it be determined that Section 4(a) of the Project Act related only to the mainstream, as the Master found, or to system water, as contended by California. Nevada's contract rights are valid whether Section 4(a) constitutes a statutory contractual allocation, as found by the Master, or whether the contracts were made under the general Reclamation Law. Likewise, Nevada's contracts are valid if that section constitutes a mandatory formula, as contended by Arizona. This is true also in the event this Court determines the case upon the basis of an equitable apportionment among the three mainstream Lower Basin States. It would be judicially proper to use the contracts made by the Secretary as a yardstick in arriving at an equitable apportionment.

This is the minimum amount to which Nevada is entitled. The Colorado River is literally the lifeblood of the Southern Nevada area and it is the controlling factor to sustain its expanding population growth. At least, so far as Nevada is concerned, uses for irrigation and navigation are relatively unimportant. Also, Nevada is unique in that it has no other source of water than Lake Mead. The two other mainstream Lower Basin States, particularly California, has alternative sources of water.

Nevada respectfully submits that there is nothing in the Briefs of the United States, Arizona, or California, that seriously challenges Nevada's right to an undiminished 300,000 acre feet of water from Lake Mead.

The allocation to Nevada proposed by the Master is fair and just and should be sustained.

Respectfully submitted,

ROGER D. FOLEY,
Attorney General

W. T. MATHEWS,
Chief Counsel

R. P. PARRY,

CLIFFORD E. FIX,
Special Counsel

Counsel for State of Nevada.

Dated August 7, 1961

APPENDIX I

SALINE WATER CONVERSION PROGRAM

At page 34 of Nevada's Opening Brief, there is described existing legislation implementing the saline water conversion program. Since then, S. 2156, "to expand and extend the saline water conversion program being conducted by the Secretary of the Interior" in the Senate, and H.R. 7916, in the House, were introduced on June 27, 1961, with administration approval. It will greatly expand this program.

In transmitting the bill to the President by letter dated June 22, 1961, Secretary of the Interior Udall said (Cong. Rec., June 27, 1961, p. 10540):

> "The results to date of this Department's saline water research and development activities under our basic authorization have in large part developed the technological advances that permit many communities in need of a dependable supply of fresh water to be interested now in the installation of conversion plants, if they could obtain the necessary financial assistance which we are recommending for your consideration. It is our opinion that the continuation of the program which this bill would authorize, should help significantly to make it possible to bring good water supplied to local communities on a basis that is economically feasible. It should also lessen the obstacle to the financing of the investment of substantial sums of money in conversion plants.
>
> ". . . although many technological problems remain to be solved, *results obtained from laboratory investigations give reliable indications that the objective of low cost converted water can be attained.* If we can reach our objectives, converted saline water may become an important source of supplemental water for many areas of the United States." (Emphasis added.)

Title I of the bill covers generally the expanded saline water research and development program. Section 8 of Title I removes expenditure ceilings and extends the time limit. As Secretary Udall points out, "It is impossible to predict in advance the rate of progress that might be achieved, or to predict the cost of solving a technological problem of this magnitude. The time and fiscal limits set by the Congress in 1952 and 1955 have proved to be inadequate. For a program that is probing in an unprecedented manner into the secrets of nature to develop an inexhaustible supply of economically competitive fresh water, it seems wise to allow adequate flexibility in the rate at which such a program shall advance. Congress has recognized, and by this legislation would reaffirm, the importance of this program. With each passing year, the program will be of much greater significance to mankind. It should be authorized to function until it has attained the objectives set forth by the Congress."

Title II repeats the 1958 law regarding demonstration projects but extends the duration of the program from seven years to fifteen years, removes the limitation on the appropriation, and authorizes the construction of an unspecified number of additional demonstration plants, including ones capable of producing not to exceed 50 million gallons of water per day.

Title III would authorize Federal financial assistance for the construction of conversion plants.

Title IV provides for grants to local governmental units or public or private utilities for that part of the investment necessary to reduce the price of water to a competitive price. It further provides for contracts with the borrower for Federal payments between the cost of converted water and a fair price for such water.

Title V directs the cooperation of the Secretary of Defense, the Secretary of State, and the heads of related agencies with the

Department of the Interior in the establishment of land based saline water conversion plants.

President Kennedy, in transmitting the bill to each House of Congress on June 26, 1961, strongly urged its passage. He said:

> "I know of no Federal activity that offers greater promise of making a major contribution to the ultimate economic well being of all mankind than this program." (Cong. Rec., June 27, 1961, p. 10540).

Senator Metcalf stated on the floor of the Senate on July 17, 1961, in commenting upon the pending legislation (Cong. Rec. p. A 5366):

> "We are on the threshold of a break-through in costs that will make saline water economically feasible, both here and abroad."

This expanded program is discussed in considerable detail in the testimony of C. F. MacGowan, Director of the Office of Saline Water, before the Subcommittee on Irrigation and Reclamation of the Interior and Insular Affairs Committee of the House of Representatives on July 17, 1961 (hearings not yet printed), and also in the testimony of Secretary Udall before the same Committee, which appears in the Congressional Record for July 17, 1961, p. A5366.

APPENDIX II

LEGISLATIVE HISTORY AND ANALYSIS OF AUTHORIZATIONS FOR CONSTRUCTION AND FINANCING OF FACILITIES TO PROVIDE WATER FOR SOUTHERN CALIFORNIA

The California Water Resources Development Bond Act (Cal. Stats., Ch. 1762; Water Code of California, Div. 6, Pt. 6, Ch. 8, Secs. 12930–12942), popularly known as the Burns-Porter Act and hereinafter referred to as the Bond Act, was submitted pursuant to Article XVI, Sec. 1 of the California Constitution to, and approved by, a vote of the people on November 8, 1960. This submission was required by Article XVI, Sec. 1 of the California Constitution for the reason that it involved incurring of a debt (bond issuance) in excess of the limitation of $300,000 set forth in the Constitution.

In its principal aspects, the Bond Act is a financing measure intended to make funds available for the construction of water facilities. As hereinafter mentioned, the Bond authorization is in the amount of $1,750,000,000, with a first priority on its use being established to construct designated facilities, among which are those required to make water available to Southern California.

Prior to the enactment of the Bond Act, certain of the facilities which are to be financed by that Act were authorized by Act of the Legislature. These, in effect, were reauthorized and more specifically described by the Bond Act.

In 1951 the Legislature authorized the Feather River and Sacramento-San Joaquin Delta Diversion Projects (Cal. Stats. 1951, Ch. 1441, amended Cal. Stats. 1956 (Ex. Sess.) Ch. 54, Cal. Stats. 1957, Ch. 1932 and Ch. 2539, Cal. Stats. 1959, Ch. 2043; Water Code of California, Div. 6, Pt. 3, Ch. 2, Sec. 11260).

As originally enacted in 1951, the Project included (a) Oroville Dam on the Feather River, with a capacity of 3,500,000

acre feet to be utilized for conservation, flood control, and power uses, (b) a power plant at the dam, (c) an afterbay dam and power plant, (d) a Delta Cross Channel, and (e) electrical transmission facilities. The Sacramento-San Joaquin Delta Diversion Project, as approved in 1951, included the Santa Clara-Alameda Diversion, the San Joaquin Valley-Southern California Diversion, and the Santa Barbara-Ventura Diversion. These "diversions" were conduits or aqueducts which would carry from the Delta water released from Oroville Dam and Reservoir and flowing in natural channels to the Delta, as well as unregulated water available in the Delta from other streams contributory to the Delta, to the areas of use. The Santa Clara-Alameda Diversion would conduct water to Bay counties south of San Francisco. The San Joaquin-Southern California Diversion would transport water to the central and southern portions of the San Joaquin Valley and across the Tehachapi Mountains to Southern California as far south as San Diego County. The Santa Barbara-Ventura Diversion would serve Santa Barbara and Ventura Counties as well as a portion of San Luis Obispo County. This latter aqueduct would be a branch of the San Joaquin Valley-Southern California facility, taking off from that aqueduct in the southern San Joaquin Valley.

In 1956 the original authorization was amended to make some changes in the project design and add some additional features. The principal modification, particularly as affecting the San Joaquin Valley and Southern California service areas, was the authorization as a part of the State project, the San Luis Reservoir in the vicinity of Los Banos in the San Joaquin Valley. This reservoir would be below the Delta and along the route of the San Joaquin Valley-Southern California aqueduct and would provide off-stream storage for unregulated winter flows available and to be diverted from the Delta.

The 1959 amendment generally approved, and more specifically described, the routing of the above mentioned aqueduct theretofore authorized, to carry water to the San Joaquin Valley and Southern California. All of the facilities described to this point have generally become known and described as the Feather River Project.

On June 3, 1960, Public Law 86–488, 74 Stat. 156, was approved by the President of the United States and authorized for construction, as a Federal project, the Federal San Luis Project in the San Joaquin Valley. This Project envisions use of the same reservoir, San Luis, as well as the same dam-site, contemplated for use in the State program. The Federal legislation provides that, upon agreement being reached with the State of California, the Secretary of the Interior is authorized to include in the San Luis Reservoir and the canal extending southward through the Federal service area, sufficient capacity to accommodate the State's needs with respect to the Feather River Project. (The Federal service area encompasses 500,000 acres of land on the west side of the San Joaquin Valley.) In other words, San Luis Reservoir and a portion of the aqueduct system theretofore authorized for construction by the State could, and undoubtedly will, be a Federally constructed facility to be jointly used by the Federal and State Governments. The State would contribute its share of the cost at the time of construction. Section 1(a) of the Federal San Luis legislation, *supra*, also provides that should the State elect not to have its share of the joint use facilities constructed when the Federal Government is prepared to proceed with its own construction, provision could be made, upon agreement by the State, for the initial construction of the dam and reservoir to be such as to permit future enlargement when the State desired and was able to proceed.

In 1959 the California Legislature approved the California

Water Plan (Cal. Stats. 1959, Ch. 2053; Water Code of California, Div. 6, Pt. 1.5, Secs. 10004–10007). This plan is a comprehensive plan for the development of all of the water resources of the State of California and includes the Feather River Project. The plan as described is described as "the guide for the orderly and coordinated control, protection, conservation, development, and utilization of the water resources of the State. This declaration does not constitute approval of specific projects or routes for transfer of water for construction by the State or for financial assistance by the State without further legislative action, nor shall this declaration be construed as a prohibition of the development of the water resources of the State by any entity." (Water Code of California, Sec. 10005.)

The last described statute which approved the California State Water Plan expressly states that its provisions do not repeal or modify any of the prior authorizations of projects (Water Code of California, Sec. 10006). Thus, the previous authorizations of the Feather River Project, *supra*, remained in effect and, indeed, were reinforced by that legislation.

In 1959, the California Legislature also created the California Water Fund (Cal. Stats. 1959, Ch. 140, Water Code of California, Div. 6, Pt. 6, Ch. 7, Secs. 12900–12915). This legislation dedicated, but did not appropriate, the funds therein, and all accruals, to the construction of water resource development works (Water Code of California, Secs. 12901(a), 12910, *supra*). Subsequently, the fund was appropriated for use in the construction of the Feather River Project by the Burns-Porter Act (Water Code of California, Sec. 12938, *supra*), as will be later discussed herein. The principal element of the California Water Fund is a portion of the funds which are derived from tidelands oil revenues. Water Code of California, Sec. 12912 (d), *supra*).

Since 1956 funds have been included in the annual budgets and appropriated by the California Legislature from the General Fund as well as the Investment Fund (predecessor to the California Water Fund), for the Feather River Project for preconstruction, construction, right-of-way acquisition, and railroad and highway relocation purposes.[1]

The Burns-Porter Act is the most significant legislation dealing with the construction of works to supply water to Southern California, as well as other areas of the State. As previously noted, it is essentially a financing Act and assures availability of $1,750,000,000 toward that construction. Of the $1,750,000,000, $130,000,000 is dedicated to the making of loans and grants for the construction of local projects which would not involve water for transport to Southern California, thus leaving $1,620,000,000 for construction of the Feather River Project. In discussing the Bond Act, reference will be made only to the Water Code sections. However, those sections are specifically designated in the Act itself. The significant, relevant sections will

be discussed in seriatim as they appear in the Act, with cross references as required.

The object of the Act is set forth in Section 12931 as being to provide funds to assist in the construction of a State Water Resources Development System for the State of California. The System is described in the section as including the "State Water Facilities." No reference is made in the Bond Act to the Feather River Project by name. However, the definition of the State Water Facilities as contained in Sec. 12934(d) of the Bond Act includes all of the facilities which form the Feather River Project in its earlier authorization. In addition, the term includes the additions to the Feather River Project consisting of a North Bay aqueduct to transport water from the Delta to counties along Northern San Francisco Bay and a drainage system for the San Joaquin Valley.

Reference in the Bond Act to the State Water Facilities is interchangeable, for all practical purposes, with the Feather River Project, although by definition (Sec. 12934(d)(4)) the term includes small local projects for which loans and grants may be made by the State. The System envisioned by the Act also includes any additional works which may hereafter be authorized by the Legislature as a part of the State Central Valley Project or the California Water Plan. However, as it will be pointed out later with reference to Section 12938, the Bond funds are dedicated, first to the construction of the State Water Facilities (Feather River Project) and to loans and grants, in the amount of $130,000,000 for small local projects.

Section 12934(d) defines the term "State Water Facilities." Among those facilities are:

(1) Oroville Dam (Water Code Section 12934(d)(1)).

(2) "An aqueduct system which will provide for the transportation of water from a point, or points, at or near the

Sacramento-San Joaquin Delta to termini in the Counties of Marin, Alameda, Santa Clara, Santa Barbara, Los Angeles, and Riverside, and for delivery of water both at such termini and at canal-side points enroute for service in Solano, Napa, Sonoma, Marin, Alameda, Contra Costa, Santa Clara, San Benito, Santa Cruz, Fresno, Tulare, Kings, Kern, Los Angeles, Ventura, San Bernardino, Riverside, Orange, San Diego, San Luis Obispo, Monterey, and Santa Barbara Counties.

"Said aqueduct system shall consist of intake and diversion works, conduits, tunnels, siphons, pipe lines, dams, reservoirs, and pumping facilities, and shall be composed of . . . a reservoir near Los Banos in Merced County . . . a San Joaquin Valley-Southern California aqueduct extending to termini in the vicinity of Newhall, Los Angeles County and Perris, at Riverside County, and have a capacity of not less than 2,500 cubic feet per second at all points North of the northerly boundary of the City of Los Angeles in the Tehachapi Mountains in the vicinity of Quail Lake and a capacity of not less than 10,000 cubic feet per second at all points north of the initial off-stream storage reservoir (San Luis Reservoir); a Coastal aqueduct beginning in the San Joaquin Valley-Southern California aqueduct in the vicinity of Avenal, Kings County, and extending to a terminal at the Santa Maria River." (Water Code, Section 12933(d)(2)).

(3) Facilities for water conservation in and transfer of water across the Sacramento-San Joaquin Delta (Water Code, Section 12934(d)(4)).

Section 12935 authorizes the incurring of a debt in the amount of $1,750,000,000 for water development purposes, principally the State Water Facilities. Section 12936 authorizes the debt as a general obligation of the State of California.

Article XVI, Section 1, of the California Constitution provides

that, if the authorizing legislation for a debt exceeding the constitutional limitation describes the ways and means by which the debt is to be repaid, those ways and means may not be changed by the Act of the Legislature during the existence of the debt. Section 12937 describes the ways and means by which the bonds are to be repaid. It pledged the revenues of the project to the payment of the bonds and to the operation of the operation and maintenance costs of the State water system, as well as reimbursement for funds used from the California Water Fund. The Section also provides that contracts between the State and water users organizations may not be changed by Act of the Legislature during the life of the bonds.

Section 12938 appropriates and makes available, without further action by the Legislature, all the bond funds for the construction of the State Water Facilities which includes the facilities which will be constructed with loans and grants to local agencies for local projects. It dedicates $130,000,000 of the total authorization for such loans and grants.

The Section also provides that all monies in the California Water Fund, except to the extent that the Legislature, in any year, by legislative action diverts money available in the Fund in that year for any other purpose, are now appropriated for use in the construction of the State Water Facilities.

Any money available in the California Water Fund available at the time a construction cost is incurred must be used in lieu of bond funds for the construction of the State Water Facilities. To the extent that California Water Fund monies are available and so used, an equal amount of the Bond funds are released from dedication to the construction of the State Water Facilities and are rededicated to, and appropriated for, the construction of additional works in the watersheds of the Sacramento, Eel, Trinity, Mad, Van Duzen, and Klamath Rivers to augment supplies of

water in the Sacramento-San Joaquin Delta. It should be noted here that this provision assures funds for the construction of works which may be required to make up for deficiencies in the supply to be made available to Southern California from the Feather River Project. One cause for such a deficiency might be the operation of the "County of Origin Statute" (Water Code of California, Sections 10500, 10505), and the "Watershed Protection Statute" (Water Code of California, Section 11460) which purports to give a prior right to the counties and watersheds with respect to all water which originates therein. Thus, if there is a "recapture" on the part of the county or watershed of origin with respect to water which theretofore had been made available by the Feather River Project to Southern California, there would be funds available to initiate, and perhaps complete, construction of additional works necessary to make up for the deficiencies created in Southern California by such recapture.

The remaining sections of the Bond Act are those which deal with the mechanical means by which the bonds are to be issued and sold.

In addition to the funds which have been appropriated and expended in the past with respect to the Feather River Project, the California Department of Water Resources administratively, in this current year, has made $400,000 available to the United States for preconstruction activity with respect to the San Luis Reservoir. This was done in anticipation of the cooperative venture by the State and Federal Governments under the Federal San Luis legislation previously mentioned. When the Federal-State contract, as required by Public Law 86–488, *supra*, Sec. 2, is executed, it is anticipated that the State promptly will advance another $1,500,000 to the United States.

There can, and undoubtedly will, be understandable confusion by the reference in this document and the Bond Act to the terms

"State Water Resources Development System" and "State Water Facilities."

While the Bond Act was initiated and intended to finance principally the Feather River Project, it was necessary and, to some extent, desirable to provide for the financing of additional works in the future. In order to make the funds available for the Feather River Project as well as the other works specifically described in Section 12394(d) of the Bond Act and to give those funds a priority in their use, as well as those in the California Water Fund in connection with the Feather River Project, the term "State Water Facilities" is defined and used in the Act. The "State Water Resources Development System" is intended to be more incompassing and includes the State Water Facilities (Feather River Project) plus additional works which can be financed with surplus project revenues (Section 12937(b)(4)), if any, and with bond funds released from priority for use in the construction of the State Water Facilities as described above by virtue of the use of California Water Fund monies (Section 12938).

ANSWERING BRIEF FOR ARIZONA

California[1] alone, of the four parties who have filed opening briefs,[2] seeks rejection of the Special Master's

[1] Since the California defendants have filed a single consolidated Opening Brief they will be referred to collectively as "California" throughout this brief.

[2] Utah and New Mexico have not filed opening briefs.

Report virtually in its entirety. Nevada accepts it with only "minor" and "perfecting" exceptions (Nev. Op. Br. 9). The United States "in large part . . . supports the Special Master's Report as filed," reserving for an answering brief the right to "deal more directly with the principal issues in the case in which [they] support the report" (U. S. Op. Br. 6). Arizona moves the adoption of the Report and Recommended Decree with such modifications as are requested in her exceptions (Ariz. Op. Br. 2).

This answering brief therefore will be addressed primarily to the Opening Brief filed by California.[3]

THE CALIFORNIA BRIEF

Asserting that her security in an adequate water supply is seriously jeopardized, California responds to the Special Master's Report with asperity and hostility. This emotional approach has impelled California counsel to contend that the Special Master's findings and conclusions are, with but few exceptions, hopelessly wrong and that his recommendations, if adopted, would result in the disposition of this case on a basis which is entirely mistaken. The result is a brief which is permeated by a multitude of misstatements and fallacious positions. It would be impossible in brief compass to catalogue and expose each misstatement and every example of erroneous reasoning. Accordingly, we shall confine this brief to a treatment of only the more irresponsible and flagrant instances.

We are constrained to say at the outset, however, that the various devices employed by California—the selective

---

[3] The issues between Arizona and the United States which are treated in the latter's Opening Brief are discussed after our consideration of the California brief (pp. 152-68, *infra*). Since the Opening Brief of the United States does not deal with the claims of the United States for federal establishments, we reserve for our reply brief such response as may be required by the discussion of these matters in the Answering Brief of the United States.

citation of parts of testimony taken out of context and the deletion of other parts; the exaggeration here and the suppression there of portions of documentary exhibits; the misreading and miswriting of the legislative history; the misstatements unsupported and often contradicted by the record; indeed, the misrepresentation and misconstruction of the Master's Report itself—combine to produce a brief designed to mislead rather than to inform.

The very crux of this case is the intent of Congress in the enactment of the Project Act. Despite the fact that this intent cannot be ascertained and understood without a thorough exploration of the voluminous legislative history of the Act and of the several Swing-Johnson bills considered by Congress preceding enactment of the statute, California's Opening Brief makes only cursory references to this vital material.[4] Even her treatment of such "legislative history" as she presents is a highly colored and fictionalized version of the facts. In the course of this brief we shall demonstrate that the California references to the legislative history of the Project Act misrepresent and distort the true legislative intent, the understanding of which is so essential to a correct construction of the Project Act and a proper determination of the basic issues presented by this case.

Four major fallacies underlie California's position:

First. That the Project Act does not abrogate but preserves principles of priority of appropriation and equitable apportionment and that these principles must be applied by the Court in the disposition of this case (Cal. Op. Br. 52-68, 138-94).

---

[4] See Cal. Op. Br. 110-24, 132-37, 144-49, 159-62, 175-88 and 239.

Second. That the reference in §4(a) of the Project Act and in the California Limitation Act to "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact" means system water, *i.e.*, includes both main stream and tributary water (Cal. Op. Br. 69-137).

Third. That the Project Act does not authorize nor do the Secretary of the Interior's water delivery contracts effectuate a contractual allocation of water among Arizona, California and Nevada (Cal. Op. Br. 195-231).

Fourth. That the dependable future water supply is not only a relevant issue but one which the Court must resolve (Cal. Op. Br. 232-78).

We shall consider each of these fallacies in order in Points I through IV of this brief.

ARGUMENT

I

The Project Act does not preserve principles of prior appropriation and equitable apportionment, as California contends, but makes a statutory apportionment of water which renders these principles inapplicable.[5]

A. California's Position

California attacks as erroneous the Special Master's conclusion (Rep. 138) that "the doctrine of equitable apportionment, and the law of appropriation are . . . irrelevant

---

[5] This point is directed principally to a refutation of Parts One and Three of California's Opening Brief, pages 52-68 and 138-94 thereof respectively. See also Cal. Op. Br. 25, 37-39, 46-47.

to the allocation'' among Arizona, California and Nevada of ''mainstream'' water as defined in the Report (Cal. Op. Br. 39, 45-47).[6] California asserts that the Master's conclusion conflicts with (1) this Court's holding in *Arizona* v. *California*, 283 U. S. 423, 464 (1931); (2) §§18, 14, 8 and 4 of the Project Act; (3) the legislative history of the Project Act and (4) the administrative, practical, and subsequent congressional construction of that Act (Cal. Op. Br. 53-54, 139-66). We shall discuss each of these contentions in order.

B. The Holding of *Arizona* v. *California*

California states that the Court's decision in *Arizona* v. *California, supra,* ''conclusively determined that the Project Act did not abrogate the principles of priority of appropriation and equitable apportionment'' (Cal. Op. Br. 139). The Court made no such determination.

The precise holding of the case was that the United States had the constitutional power to authorize in the Project Act the construction of Hoover Dam for the purpose of improving navigation of the Colorado River, a navigable stream, and that, therefore, contrary to one of Arizona's contentions at the time, the Secretary of the Interior was ''under no obligation to submit the plans and specifications to the State engineer for approval'', despite the fact that the dam and reservoir were to be located partly within the state. 283 U. S. at 451-52 (footnote omitted).

In rejecting Arizona's further contention—that ''the mere existence of the Act will invade quasi-sovereign rights of Arizona by preventing the State from exercising its right

---

[6] Arizona does not concede that California ever acquired any valid appropriative rights to the water of the Colorado River (see Ariz. Op. Br. 33-35).

to prohibit or permit under its own laws the appropriation of unappropriated waters flowing within or on its borders", 283 U. S. at 458, all the Court held was that, *assuming* these "quasi-sovereign rights" in Arizona survived the Project Act, their alleged threatened invasion was not then so imminent and immediate as to warrant injunctive relief. As Justice Brandeis stated:

> "The claim strenuously urged is that the existence of the Act, and the threatened exercise of the authority to use the stored water pursuant to its terms, will prevent Arizona from exercising its right to control the making of further appropriations.
>
> * * * * * *
>
> "This contention cannot prevail because it is based not on any actual or threatened impairment of Arizona's rights but upon assumed potential invasions." 283 U. S. at 460, 462.

Accordingly, the bill of complaint was

> "dismissed without prejudice to an application for relief in case the stored water is used in such a way as to interfere with the enjoyment by Arizona, or those claiming under it, of *any* rights already perfected or with the right of Arizona to make additional *legal* appropriations and to enjoy the same." 283 U. S. at 464.[7]

The Court noted that when the bill of complaint was filed construction of the dam had not been commenced and that years would elapse before the project was completed. Actually, it was not until February 1, 1935 (almost four years after the decision) that water was first impounded (Rep. 32-33). Clearly then, as of the date of decision (May 18, 1931), there was and could have been no "physical acts"

---

[7] Unless otherwise indicated, italics appearing in quotations in this brief have been added for emphasis.

by the Secretary of the Interior interfering with rights, if any, in Arizona.

As the Court said:

> "The Act does not purport to affect any legal right of the State, or to limit in any way the exercise of its legal right to appropriate any of the unappropriated 9,000,000 acre-feet which may flow within or on its borders. . . . There is no allegation of definite physical acts by which Wilbur is interfering, or will interfere, with the exercise by Arizona of its right to make further appropriations by means of diversions *above the dam* or with the enjoyment of water so appropriated. Nor any specific allegation of physical acts impeding the exercise of its right to make future appropriations by means of diversions *below the dam,* or limiting the enjoyment of rights so acquired, unless it be by preventing an adequate quantity of water from flowing in the river at any necessary point of diversion." 283 U. S. at 462-63 (footnote omitted).[8]

Lastly, but not of least importance, at the time of this decision Arizona had not ratified the Colorado River Compact and therefore, as the Court noted, was not bound by its terms. 283 U.S. at 462.

Whether or not claimed appropriations of water of the river would give rise to rights to water stored pursuant to the Project Act, which rights the Secretary of the Interior would be bound to respect, was a question clearly not before the Court and not decided. That is one of the basic questions here for adjudication. Nor did the Court have before it for decision the further "question, which must be answered in this litigation, of the extent of the Secretary's authority under the Project Act to control the allocation of water among the states" (Rep. 160).

---

[8] The omitted passage in the quotation concerns §18 of the Project Act, which we discuss hereafter (pp. 8-11, *infra*).

The Master does not propose "to distinguish this Court's decision out of existence", as California charges (Cal. Op. Br. 143 note 6). Rather, from the precise holding of the case—that Congress had the constitutional power to enact the Project Act and thereby authorize construction of Hoover Dam as an aid to navigation—the Master validly draws the proper conclusion that "once the United States impounds the water and thereby obtains physical custody of it, the United States may control the allocation and use of unappropriated water so impounded" (Rep. 160-61). It is this necessary consequence of the decision in *Arizona* v. *California* which California strives to avoid by insistently asserting principles of equitable apportionment and priority of appropriation as the source and measure of water rights, which are, in fact, created and controlled exclusively by the Project Act.

C. Project Act §§ 18, 14, 8, and 4

California next argues that "Sections 18, 14, 8, and 4 plainly manifest Congress' intention to preserve existing western water law" (Cal. Op. Br. 145). The provisions, purposes and legislative evolution of these sections expose the lack of merit in this contention.

(1) Section 18

Section 18 does not preserve appropriative rights *interstate* or as against the United States. It merely disclaims any intention to interfere "with such rights as the States now have either to the waters *within their borders* or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters *within their borders,* except as modified by the Colorado River compact or other interstate agreement" (Ariz. Op. Br. Appendix B, pp. 25a-26a).

In no event can §18 be construed as applying to the *interstate* allocation of water stored pursuant to the Project Act. Once that water is impounded by the United States, it ceases to be water subject to the sovereign dominion of any state. Otherwise, its release and delivery from Lake Mead would be controlled by state law and policy instead of by contracts which the Secretary of the Interior is authorized by §5 of the Project Act to make and without which "no person shall have or be entitled to have the use for any purpose of the water stored as aforesaid. . . ." (Ariz. Op. Br. Appendix B, p. 15a).

California's assertion (Cal. Op. Br. 145-46) that §18 permits rights to water, interstate and intrastate, to be modified only by interstate agreement is wholly unsupported and is unsound. This is demonstrated by the provision of §8(b) which subordinates any interstate compact for allocation of stored water among the Lower Basin states, concluded subsequent to January 1, 1929, to water delivery contracts theretofore made by the Secretary pursuant to §5.

Although this Court in *Arizona* v. *California, supra* at 462, quoted the provisions of §18, it did not state or imply that the general language of that section controlled the specific language of §5. In view of the Court's holding that Congress has the constitutional power to impound the water of the river, it cannot be inferred that Arizona or any other state had the "right" to appropriate or to authorize the appropriation of that water and thereby to impinge upon the Secretary's authority to regulate and control the storage, delivery and use of the water pursuant to §5.

As the Court said in the later case of *Arizona* v. *California*, 298 U. S. 558, 569 (1936):

> "The Colorado River is a navigable stream of the United States. The privilege of the States through which it flows and their inhabitants to appro-

priate and use the water is subject to the paramount power of the United States to control it for the purpose of improving navigation."

Finally, California asserts that the intent of §18 "to preserve existing law . . . is confirmed by the legislative history of that section" (Cal. Op. Br. 146). This so-called "legislative history" consists of a statement of Senator King,[9] wholly unrelated to §18, in which he questioned the constitutional power of the federal government to exercise dominion over navigable waters and to allocate their use. Senator King reflected views similar to those of some of his colleagues, but it is a fabrication of history for California to say that the "same view of Congress' power was repeated . . . by almost every member of Congress who had anything to do with the legislation" (Cal. Op. Br. 146 note 8).[10] It is also ironical that California now cites Senator King, who bitterly opposed the Swing-Johnson bills as providing for an interstate allocation of water in violation of state sovereignty, when California's Congressman Swing and Senator Johnson, the bills' authors, never denied this would be their effect, never attempted to modify those provisions which Senator King found obnoxious, but instead pushed the legislation through to final passage. Indeed, California's witnesses at the congressional hearings expressed the opinion that Congress had the constitutional power to do the very thing which California now says the Project Act never contemplated—*i.e.*, provide for an allocation of water among the states.[11] The one point on which there was no dissent in Congress was that the Swing-John-

---

[9] Senator King was referring to Senator Hayden's proposed amendment to §4(a). 70 Cong. Rec. 169 (1928), Ariz. Legis. Hist. 45-46.

[10] See discussion, pp. 33-44 and note 56, *infra*.

[11] See discussion, pp. 36-37, 41-43, *infra*.

son bills *did* provide for a federal allocation of water among the states.[12]

(2) Section 14

California further contends that "section 14 of the Project Act, incorporating section 8 of the Reclamation Act of 1902, likewise compels recognition of prior appropriation and equitable apportionment principles" (Cal. Op. Br. 147).[13]

Section 14 provides:

> "This Act shall be *deemed a supplement* to the reclamation law, which said reclamation law shall govern the *construction, operation, and management of the works* herein authorized, *except as otherwise herein provided.*"

The fact that the Project Act is to be deemed a "supplement to the reclamation law" does not mean that the Reclamation Act itself, or any specific section thereof, is *incorporated* into the Project Act.

Furthermore, §14 expressly limits the application of the Reclamation Act to "the construction, operation, and

---

[12] See discussion, pp. 17-20, 33-47 and note 56, *infra.*

[13] Reclamation Act of 1902, §8, 32 Stat. 390, 43 U. S. C. §§372, 383 (1958). Section 8 provides:

> "That nothing in this Act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this Act, shall proceed in conformity with such laws, and nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof: *Provided,* That the right to the use of water acquired under the provisions of this Act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right."

management of the works herein authorized. . . ." Even in this area, whenever the Reclamation Act conflicts with the Project Act, the latter controls, as is made clear by the clause "except as otherwise herein provided".

The Court, in *Ivanhoe Irr. Dist.* v. *McCracken,* 357 U. S. 275, 291 (1958), interpreted §8 of the Reclamation Act as follows:

> "As we read §8, it merely requires the United States to comply with state law when, in the construction and operation of a reclamation project, it becomes necessary for it to acquire water rights or vested interests therein. But the acquisition of water rights must not be confused with the operation of federal projects."[14]

Section 14 does not provide that the right to receive water shall be governed by the Reclamation Act. That right must be obtained under the provisions of §5 by contract with the Secretary.

California asserts that the congressional intent to recognize in §14 prior appropriation and equitable apportionment principles "is confirmed by the legislative history of that section" (Cal. Op. Br. 147-48). The only "legislative history" referred to in this instance consists of statements of Messrs. Swing and Johnson made in connection with the third Swing-Johnson bill (Cal. Op. Br. 148-49 notes 2, 4). But when they expressed the views cited by California, their pending bills did not contain the provisions of §4(a) as finally enacted nor did they include the proviso later added to §5 that the Secretary's water deliv-

---

[14] In *Ivanhoe*, counsel for Imperial Irrigation District in the case at bar unsuccessfully argued for appellees in this Court that "federal law leaves to state jurisdiction the capacity of irrigation districts to contract, and the control, appropriation, use, and distribution of water for irrigation purposes." 2 L. Ed. 2d 2124.

ery contracts "shall conform to paragraph (a) of section 4 of this Act".

The actual legislative history, which shows that Congress did not intend by the Project Act that the doctrine of appropriative rights should control the interstate allocation of Colorado River water in the Lower Basin, is discussed later (pp. 17-20, *infra*).

Ickes v. *Fox*, 300 U. S. 82 (1937), and *Nebraska* v. *Wyoming*, 325 U. S. 589 (1945), are cited by California as "conclusively" establishing that "contracts executed by the Secretary of the Interior pursuant to Section 5 of the Project Act, like other reclamation contracts, are merely a step in the acquisition of water rights which come into being by diligence in putting waters to beneficial use in accordance with the principles of priority of appropriation and equitable apportionment" (Cal. Op. Br. 150).

The issue in *Ickes* v. *Fox, supra*, was whether the Secretary of the Interior could require landowners in a reclamation project, as a condition to continuing to receive project water, to pay part of the cost of additional project works from which, it was alleged, they would receive no benefit. Upon the "undenied allegations of the bill" the Court found that the landowners had "fully discharged all their contractual obligations" (including payment in full of their repayment obligation under the original project) and consequently "that their water-rights have become vested; and that ownership is in them and not in the United States." 300 U. S. at 96.

Nebraska v. *Wyoming, supra*, presented the question whether the reclamation project rights should be decreed separately to the United States or included within the state allocations. There was not involved, as there is here, construction of statutory provisions such as §5 of the Project

Act governing administration of project water. The Court was careful to say:

> "We do not suggest that where Congress has provided a system of regulation for federal projects it must give way before an inconsistent state system." 325 U. S. at 615.

California's attempt to extend the state law of prior appropriation to control the interstate allocation of the water of the Colorado River is incompatible with the allocation scheme envisaged by Congress in §§4(a) and 5 of the Project Act.

California excepts to the Master's holding that contracts for diversion of "mainstream" water executed under the reclamation laws *prior to* the Project Act meet the requirements of §5. She argues that such contracts could not have been made pursuant to a contractual allocation scheme not conceived nor authorized by Congress until years later (Cal. Op. Br. 153-58). But, although antedating the Project Act, these contracts are wholly within the allocation scheme established by the Act.

For example, although the Kunz contract was made in 1910, the Reservation Division of the Yuma Project in California, on which Kunz secured a water right, was recognized in California's Seven-Party Agreement as having a right subordinate only to the first priority of the Palo Verde Irrigation District (Cal. Op. Br. 154). The Seven-Party Agreement was executed at the request of the Secretary and fixed "the relative rights and priorities of those [California] defendants in the water available for use in California under the Colorado River Compact and the California Limitation Act" (Cal. Op. Br. A2). Thus, the Kunz contract is satisfied by water delivered within and from the apportionment made by §4(a) and pursuant to

the Secretary's contracts for the delivery of stored water to California agencies under §5.

Again, the "standard reclamation contracts" for deliveries of water to users in Arizona, made before and after enactment of the Project Act but prior to execution of Arizona's water delivery contract in 1944, are also compatible with the allocation scheme established by the Act. Under the Secretary's contract with Arizona, deliveries of water to Arizona users "shall be made for use within Arizona to such individuals, irrigation districts, corporations or political subdivisons . . . as may contract therefor with the Secretary, and as may qualify under the Reclamation Law. . . ." (Ariz. Op. Br. Appendix E, p. 39a). As the Master concluded:

> "This being the case, the Secretary is free, subject to statutory limitations, to contract with users in Arizona qualifying under the reclamation law for the delivery to them of certain amounts of water out of the total amount allocated to Arizona. This is precisely what the Secretary has done in the contracts which are before us in this case." (Rep. 216)

The Arizona contract also provides in Article 7(*l*):

> "All consumptive uses of water by users in Arizona, of water diverted from Lake Mead or from the main stream of the Colorado River below Boulder Dam, whether made under this contract or not, shall be deemed, when made, a discharge pro tanto of the obligation of this contract."

(3) Sections 8(a) and (b) and 4(a)

California argues that if the Project Act "abrogated appropriations", then the word "appropriators" appearing in §§8(a) and (b) of the Project Act "is not only misused, it is misleading" (Cal. Op. Br. 158). But the

terms "all users and appropriators" appearing in §§8(a) and (b) were employed merely to insure that all persons claiming rights on any basis should be controlled by the Compact or any tri-state compact entered into pursuant to the Act. These provisions were inserted in the Project Act at the insistence of the Upper Basin,[15] which wanted assurance that the vast increase in use of Colorado River water which would follow construction of Hoover Dam would not obligate the Upper Basin to deliver to the Lower Basin more water than that specified in Article III of the Compact. Hence, these provisions neither confirmed nor conferred any rights, but simply subjected any and all claims of right to the Compact.

Section 4(a) provides that the limitation on California shall include "all water necessary for the supply of any rights which may now exist" (Ariz. Op. Br. Appendix B, p. 12a). From this California argues that "those rights must refer to interstate rights under equitable apportionment principles, including priority of appropriation, since no other basis for interstate rights was then recognized in the lower basin" (Cal. Op. Br. 158). This does not follow. Rather, this provision was included to prevent California from successfully asserting that she had rights of any kind, independent of the Project Act and surviving its enactment, by virtue of which she might seek to obtain water in addition to the maximum to which she was "irrevocably and unconditionally" restricted by §4(a) and her Limitation Act (Rep. 306-07).

---

[15] *Hearings on H.R. 6251 and H.R. 9826 Before the House Committee on Irrigation and Reclamation*, 69th Cong., 1st Sess. 96-99, 135-89, 196-219 (1926) (hereinafter cited as "*Hearings on H. R. 6251*").

D. Legislative History and Administrative Construction

(1) Legislative History

California's historiographers must have read a legislative history far different from that which we have read to sustain the California thesis that "the Project Act preserved priority of appropriation and equitable apportionment in the 'mainstream' and in every other part of the Colorado River System in the lower basin" (Cal. Op. Br. 159). The California brief in this particular instance cites only a few isolated statements culled out of the voluminous historical record. These few selections can hardly be dignified as "legislative history".

The only "history" before passage of the Project Act to which reference is made consists of one statement each of Congressman Swing, Senator Johnson and Senator King (Cal. Op. Br. 146-47, 148-49 notes 2 and 4). It is clear that Messrs. Swing and Johnson were not talking about the Project Act's effect on appropriative rights *interstate* but about its effect upon *intrastate* appropriations. Thus Mr. Swing stated that after "it [the Government] turns the water loose", an individual user within a state "will acquire his water right, if he acquires one, from the State and under the laws of the State, in which he puts the water to a beneficial use" (Cal. Op. Br. 148 note 2).[16] Similarly, Senator Johnson stated in effect that state law would govern intrastate appropriations and priorities in accordance with the Reclamation Act (Cal. Op. Br. 149 note 4).

On the other hand, the true legislative history shows overwhelmingly the full realization by both friend and foe of the Swing-Johnson bills that they would inevitably supersede the interstate operation in the Lower Basin of the

---

[16] Quoting from *Hearings on H.R. 9826 Before the House Committee on Rules*, 69th Cong., 2d Sess. 116 (1927).

doctrines of prior appropriation and equitable apportionment.

Thus, shortly after the signing of the Compact, in discussing the second Swing-Johnson bill, Congressman Swing expressed his views as to the combined effect of his bill, the Compact and the proposed dam, whether constructed by public or private agency, on whatever appropriative rights might then exist in the Lower Basin:

> "Mr. Raker [of California]. Is it your contention that if such a dam should be built by private individuals, with such reservoir capacity, that the rights of the appropriators farther down the stream would be lost; that is, their right for private appropriation and use would be lost and would have to depend upon the dam?
>
> "Mr. Swing. That is the clear purport of article 8 of the compact. . . .
>
> * * * * * *
>
> "Mr. Raker. Right in that connection, is it your contention, taking the private appropriations of the dam for Arizona and California and the appropriation for the Imperial irrigation district of California and the ordinary mean low flow of water, that this compact would take the right of those private appropriators away, under that compact, even if it was ratified by the seven States and approved by Congress?
>
> "Mr. Swing. I submit to your own judgment the meaning of the English language as set forth in article 8.
>
> "Mr. Raker. I did not put the question before as I did now.
>
> "Mr. Swing. As far as I am willing to go, it is this. It is the clear purport of the paragraph. It

> certainly is what it declares. I do not know how it could be avoided."[17]

Mr. Swing repeated these views in the Senate committee hearings on the pending legislation.[18]

Arthur P. Davis, Director of the Reclamation Service, expressed his understanding of Swing's statement as to the effect of the proposed dam:

> "The representative from Imperial Valley has testified that the district is willing to yield all claim to the low water flow in exchange for a right in the reservoir, and no doubt all irrigators served from the reservoir would do the same."[19]

In the 69th Congress, Mr. Swing again repeated that California was willing to give up her appropriative rights if storage were provided on the river by enactment of his bill:

> "In the interests of peace on the river, all it [California] asks is that it be afforded storage to take the place of its present rights in and to the natural flow of the river."[20]

Before the House Rules Committee in the 70th Congress it was suggested that only a low dam was needed for flood-control purposes. Mr. Swing disagreed:

> "California can not afford to support such a proposal, because under the Colorado River compact, California must surrender her present water rights

to the natural flow of the river and look to storage instead.''[21]

Governor Dern of Utah insisted at the Senate hearings in the 70th Congress that state laws regulating the appropriation of water should remain inviolate. He opposed the pending Swing-Johnson bills because, he said:

> ''The pending bills propose an entirely new and revolutionary national policy, and completely reverse the former position of Congress with respect to the waters of western streams. Never before has Congress gone so far as to attempt to appropriate water without the consent of a State. The West has always heretofore seen to it that its sovereign rights were respected.''[22]

In the Senate debate during the first session of the 70th Congress, Senator Johnson was explaining the provisions, then in §5 of the bill, which would limit California to 4,600,000 acre-feet per annum. He apparently could not understand why some Senators still opposed the bill, since their insistence on further protection under the doctrine of prior appropriation would permit ''this water to continue to flow down to the sea for an indefinite period, to go to waste in the Gulf of California. . . .''[23] He concluded this point by saying:

> ''Ah, you will see in the days to come what will happen in that river if no protection be accorded those people and the appropriation law of the West be permitted to obtain. Then will be demonstrated the utter futility of the position that is now maintained by some.''[24]

[24] 69 Cong. Rec. 7251 (1928).

A major controversy over the Swing-Johnson bills arose from the fact that they would place full control over the water of the Colorado River in the hands of the federal government. It was generally recognized that the legislation would set up machinery to effect a federal allocation of water among the Lower Basin states in disregard of state laws governing the acquisition of water rights under the doctrine of prior appropriation (pp. 33-47, *infra*). It was this very fact—that the Project Act was intended to abrogate and in effect abrogated the interstate application of the doctrine of prior appropriation—which caused many members of Congress and others to oppose it so vehemently.

(2) Administrative Construction

California's claim that the Project Act has been administratively construed as not displacing the doctrine of prior appropriation is based largely upon excerpts from certain documents selected from about sixty papers constituting the "Offer of Proof" which California made in connection with her oral argument on the Draft Report and which was rejected by the Master (Rep. 248-53). In so ruling the Master said:

> "California contends that these papers, if admitted in evidence, would establish:
>
> "(1) That state and federal officials concerned with the administration of the Project Act construed Section 4(a) to be applicable to the tributaries as well as to the mainstream, as California contends . . . ;
>
> "(2) That the Secretary of the Interior had no intention of apportioning water when he entered into water delivery contracts with the several California defendants and with Arizona and Nevada.
>
> "Careful consideration of the Offer of Proof leads to the conclusion that the papers proffered do not establish either of these contentions.
>
> * * * * * *

> "My conclusion is that both Arizona and California have, with respect to the meaning of Section 4(a), taken various positions from time to time as their immediate interests dictated and that the Offer of Proof fails to show a consistent interpretation of the Act by either.
>
> "So far as United States government officials are concerned, the dominant note sounded in the proffered papers is the avowed refusal of these officials to take sides in the Arizona-California controversy. . . ." (Rep. 248, 252)

Despite this ruling of the Master, California refers to these excluded documents as if they had been admitted in evidence as competent, and she attributes to them a persuasiveness which the Master refused to acknowledge. An examination of those documents will demonstrate that the Master was right.

In addition to the materials rejected by the Special Master, California makes reference to a letter of the Acting Secretary of the Interior dated July 31, 1930, answering an inquiry as to whether or not the Palo Verde Irrigation District would need a water delivery contract.

All the Acting Secretary said in his letter of July 31, 1930 was: "If no stored water is required by the Palo Verde Irrigation District, no contract between that district and the United States will be required. The Acting Secretary concluded his letter: "If by any chance it should later develop that stored water is required, the matter can then receive further consideration."[25]

When it later developed that the District did require stored water, the matter was reconsidered and the Secretary's contract with the District, concluded under date of February 7, 1933, recited:

---

[25] C 351 (Tr. 9929).

> "(4) Whereas the District is desirous of entering into a contract for the delivery to it of water from the Boulder Canyon Reservoir, and it is to the mutual interest of the parties hereto that such contract be executed *and the rights of the District in and to waters of the river be hereby defined.*" (Ariz. Op. Br. Appendix H, p. 60a)

The rights of the District in and to the waters of the river were thus defined by contract with the Secretary pursuant to Project Act §5, not under the law of prior appropriation, and the rights thus defined were to *stored* water, not to *natural flow.*

California refers to the fact that "at all times, however, users in Arizona, both with and without contracts, have ordered and received 'mainstream' water for consumptive use" (Cal. Op. Br. 164) (footnote omitted). Plate 3 to California's brief is said to illustrate that users in Arizona and California have received "mainstream" water with and without water delivery contracts (Cal. Op. Br. 164 note 8). The non-contract users (shown in red on Plate 3) are the City of Needles in California, which uses well water—not subject to delivery by the Secretary from Lake Mead; the South Gila Valley in the Gila Project in Arizona, which is also irrigated from wells; Yuma Indian Reservation lands in California, which are expressly recognized as having water rights in the Seven-Party Agreement[26]; and the Colorado River Indian Reservation in Arizona, which the Master has held does not require a water delivery contract (Rep. 312 note 3a). These water uses are neither inconsistent with nor violative of the contractual allocation scheme of the Project Act.

---

[26] Cal. Op. Br. A3, A13-14.

California asserts that in 1935 Arizona sued the other six Colorado River Basin states for "a judicial apportionment among the states of the Colorado River basin of the unappropriated water of the river", *Arizona* v. *California*, 298 U. S. 558, 560 (1936), and thereby recognized that the Project Act had not nullified the application of the principles of equitable apportionment and priority of appropriation (Cal. Op. Br. 164-65 note 9). The Court there said:

> "The relief asked, and that which upon the facts alleged would alone be of benefit to Arizona, is a decree adjudicating to petitioners the 'unclouded . . . rights to the permanent use' of the water. Such a decree could not be framed without the adjudication of the superior rights asserted by the United States. The 'equitable share' of Arizona in the unappropriated water impounded above Boulder Dam could not be determined without ascertaining the rights of the United States to dispose of that water in aid and support of its project to control navigation, and *without challenging the dispositions already agreed to by the Secretary's contracts with the California corporations, and the provisions as well of §5 of the Boulder Canyon Project Act that no person shall be entitled to the stored water except by contract with the Secretary.*
>
> * * * * * *
>
> "*Every right which Arizona asserts is so subordinate to and dependent upon the rights and the exercise of an authority asserted by the United States that no final determination of the one can be made without a determination of the extent of the other.*" 298 U. S. at 571.[27]

Contrary to California's assertion that the Court's opinion did not suggest the possibility that the Project Act nullified

---

[27] The suit was dismissed because the United States was not a party.

equitable apportionment and priority of appropriation, the foregoing excerpt shows that such a possibility and indeed probability was clearly anticipated by the Court.

E. Sections 5 and 8(b) of the Project Act

California's allegation that the "Master misconstrues and misapplies Sections 5 and 8(b) of the Project Act" (Cal. Op. Br. 166) is based upon the claim that water delivery contracts were not intended as a substitute for an interstate compact, in the absence of which the law of equitable apportionment and priority of appropriation controls the interstate disposition of the waters of the Colorado River system (Cal. Op. Br. 166-67).

At the outset, California agrees with the Master that §§1, 5 and 8(b) of the Project Act reserve "to the United States broad powers over the waters impounded in Lake Mead and delegate this power to the Secretary of the Interior, as agent of the United States" (Cal. Op. Br. 166, quoting from Rep. 152). But California fails to realize that the management and control of the reservoir and dam for the primary purposes of improvement of navigation, flood control and river regulation necessarily preclude the operation of these works and structures to meet demands for delivery of water at the times and in the quantities required to satisfy appropriative rights (Ariz. Op. Br. 41-42). As a practical matter, it would be impossible for the Secretary to satisfy prior appropriative rights and at the same time to exercise the authority and discretion, which California admits he has, "to administer the orderly storage and delivery of water" (Cal. Op. Br. 167).

(1) The Statutory Scheme of the Project Act

California emphasizes the last sentence of §5—

> "No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated."

—and argues that, since this provision applies only to "stored waters", it must follow that "holders of pre-existing rights in natural flow available for consumptive use without Hoover Dam regulation do not need water delivery contracts" (Cal. Op. Br. 169-70).

California asserts that after construction of Hoover Dam pursuant to the Project Act there were two distinct and separate categories of Colorado River water: (1) that portion of the river which could have been used to satisfy prior rights in the unregulated flow and (2) stored water, *i.e.*, "water in excess of that which could have been used under prior rights from 'unregulated flow' " (Cal. Op. Br. 169 note 5). It is urged as a necessary corollary of this premise that the Secretary's authority under the Project Act is limited to the storage of only such water as is in excess of that which could have been used under prior rights in the unregulated flow. It is argued further that natural flow rights survived the enactment of the Project Act and the construction of Hoover Dam and that the Secretary's water delivery contracts recognize and provide for the satisfaction of such natural flow rights (Cal. Op. Br. 171-75).

This entire line of argument is refuted by the provisions of the Project Act itself. Section 1 expressly authorizes the Secretary of the Interior "to construct, operate, and maintain a dam and incidental works in the main stream of the Colorado River" for "the purpose of controlling the floods, improving navigation and regulating the flow of the Colorado River. . . ." As the Master found, "Congress

realized that the dam authorized by the Project Act would impound substantially all the water of the mainstream" (Rep. 153) (footnote omitted). Manifestly, the authors of the Project Act intended that the entire flow of the river should be regulated and recognized that the natural flow inevitably would be destroyed.

The administrative practice does not accord with, but negates, California's position. No water users have demanded the release of water in accordance with or in satisfaction of prior appropriative rights (Ariz. Op. Br. 46). If there were any such appropriative rights, they have been abandoned. That Hoover Dam and Lake Mead have continually been operated and that water delivery contracts have consistently been formulated without regard to appropriative rights is persuasive evidence of administrative recognition that the Project Act established a contractual allocation scheme wholly unrelated to and superseding the law of prior appropriation.

The clause in the Secretary's water delivery contract with Palo Verde Irrigation District, which California quotes only in part (Cal. Op. Br. 171), reads as follows:

> "(6) The United States shall, *from storage available in the Boulder Canyon Reservoir,* deliver to the District each year at a point in the Colorado River immediately above the District's point of diversion known as Blythe Intake (or as relocated within two miles of the present intake) so much water as may be necessary to supply the District a total quantity, including all other waters diverted for use of the District from the Colorado River, in the amounts and with priorities in accordance with the recommendation of the Chief of the Division of Water Resources of the State of California, as follows (*subject to availability thereof for use in California under the Colorado River Compact and*

> *the Boulder Canyon Project Act*)." (Ariz. Op. Br. Appendix H, pp. 60a-61a)

There then follow the intrastate allotments among the California water users as fixed in the Seven-Party Agreement.

Article (6) is preceded by Article (4), which provides:

> "(4) Whereas, the District is desirous of entering into a contract for the delivery to it of water *from Boulder Canyon Reservoir,* and it is to the mutual interest of the parties hereto that such contract be executed and *the rights of the District in and to waters of the river be hereby defined.*" (Ariz. Op. Br. Appendix H, p. 60a)

Articles (4) and (6) of the Palo Verde contract, taken together, demonstrate that the District agreed to look to stored water as the exclusive source of supply for the satisfaction of its rights to the delivery of water as defined in the contract.

The Secretary's water delivery contracts with all the California agencies make it self-evident that:

> (1) Only stored water is dealt with.
>
> (2) The deliveries are to be made in accordance with the intrastate *contractual* priorities in stored water established by the Seven-Party Agreement, not the *appropriative* priorities, if any, in the natural flow of the river.
>
> (3) The deliveries are to be of water available for use in California under the Compact and Project Act, not water available under the doctrine of prior appropriation.

The phrase "including all other water diverted for use of the District from the Colorado River" in the Palo Verde contract and language of like import in the contracts of other California defendant agencies were not intended to

provide for the satisfaction of any prior appropriative natural flow rights. Had this been the intention, explicit provisions accomplishing that purpose would have been employed.

The Project Act contemplates release of stored water for purposes other than irrigation and domestic use. It was also recognized that there might be water in the stream released for, but not diverted by, users other than the Palo Verde District. The phrase "including all other water diverted for use of the District from the Colorado River" was inserted in the Palo Verde contract (and the other California water delivery contracts) to make certain that all Colorado River water diverted by the District, whether consisting solely of water released for delivery by the United States at the diversion point specified in the Palo Verde contract or made up in part of water released for other purposes or diverted by the District at other diversion points, should be charged to the District under its contract. This is consistent with the requirement of Project Act §5:

> "No person shall have or be entitled to have the use for any purpose of the water stored as aforesaid except by contract made as herein stated."

Thus the very terms of the California contracts are inconsistent with the California theory that the contracts recognize prior appropriative rights.[28]

---

[28] California draws an invalid analogy between a water delivery contract under the Project Act and "a permit or a license to appropriate" (Cal. Op. Br. 174). We agree that an *appropriative* right "is created and preserved by exercising due diligence in putting water to beneficial use, not by a piece of paper. . . ." But a *contractual* right is founded upon contract; and the water delivery contracts required by Congress as a prerequisite to the delivery of Lake Mead water are not mere "pieces of paper" nor are they in any sense "permits or licenses to appropriate" water. They are genuine muniments of title without which no one is entitled to the delivery or use of stored water and with which the contracting party is entitled to water irrespective of prior beneficial use.

(2) Legislative History of §5

In support of the hypothesis that §5 of the Project Act is not a source of authority for the interstate allocation of water (Cal. Op. Br. 168), California refers to a so-called "legislative history" of §5. Once again, California's historiographers misread and miswrite history.

To be sure, while the Swing-Johnson bills were pending, Secretary of the Interior Work recommended that the water to be stored should be administered by means of water delivery contracts (Cal. Op. Br. 176).[29] Subsequently, a committee print of H.R. 6251, considered by the House Committee on February 5, 1926, incorporated for the first time the provision:

> "Sec. 5. That the said Secretary is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof. . . ."[30]

Section 5 in this committee print also provided:

> "Contracts respecting water for domestic uses may be for permanent service *but subject to rights of prior appropriators.*"[31]

California makes no mention of this latter sentence or of the fact that the italicized phrase was subsequently deleted in the House committee on April 16, 1926 at the suggestion

---

[29] Arizona does not agree with the repeated assertions of California to the effect that Congress intended the proposed water delivery contracts to be "patterned after ordinary reclamation contracts". However, the point is not material because, while these assertions are not a fair reading of Secretary Work's various communications, subsequent congressional action destroys any significance they might otherwise have had.

[30] *Hearings on H.R. 6251,* at 11.

[31] *Id.* at 12. The same language appeared in the companion bill, S. 3331, introduced in the Senate by Senator Johnson on February 27, 1926. Ariz. Legis. Hist. 4-5.

of the Upper Basin group.[32] The expunging of the phrase "but subject to rights of prior appropriators" was a specific rejection of the principle that appropriative rights should survive the Project Act and be recognized and satisfied by the Secretary's water delivery contracts.

To make clear that water rights should be founded upon contracts rather than upon appropriations, there was added, simultaneously with the striking of the clause preserving appropriative rights, the last sentence of §5:

> "No person shall have or be entitled to have the use *for any purpose* of the water stored as aforesaid except by contract made as herein stated."[33]

California next quotes Delph Carpenter to the effect that this last sentence was proposed by the Upper Basin states so that no use of water might occur from the utilization of the proposed dam which could later be said to be independent of the Compact and to create rights adverse to the Upper Basin states. She emphasizes Mr. Carpenter's statement that:

> "It [the Compact] has nothing to do with the interstate relations between Arizona and California." (Cal. Op. Br. 179)[34]

Much has been omitted from California's version of Mr. Carpenter's testimony which makes clear his recognition that §5, even as it then stood,[35] authorized the Secretary

---

[33] *Hearings on H.R. 6251,* at 115.

[33] *Ibid.*

[34] Quoting from *id.* at 163. The California quotation would indicate that "It" referred to the Project Act.

[35] Section 5 did not then contain, as it did when enacted, the clause:

> "Contracts respecting water for irrigation and domestic uses shall . . . conform to paragraph (a) of Section 4 of this Act."

Nor did §4(a) then contain either the California limitation provisions or those relating to the tri-state compact.

to contract for the delivery of stored water regardless of any alleged prior appropriative rights. For example, in response to the suggestion of Congressman Hayden that "should this bill pass, the water will be first applied to a beneficial use in California, and when the time comes for development in Arizona, my State may have no water", Mr. Carpenter stated:

> "It is also true that, under this bill, *the Secretary of the Interior could contract with water users in the State of Arizona for the use of water or power without let or hindrance,* except that the party contracting with the United States would agree that his particular claim should be subordinate to the Colorado River compact, *not subordinate to the rights of the State of California*—simply subordinate to the rights of the upper States as defined in the compact."[36]

This, we believe, is what Mr. Carpenter really meant when he said (as quoted by California):

> "In other words, the compact does not disturb the rights between Arizona, California, and Nevada, *inter sese,* as to their portion of the water." (Cal. Op. Br. 179)

That is to say, the Compact made only an *inter-basin* apportionment and left the Lower Basin states free to contract with the Secretary for stored water on a basis of equality and regardless of prior appropriative rights.

Indeed, Mr. Carpenter was so understood by Mr. Swing, author of the pending House bill. This is shown by the statement he made immediately after the above-quoted Carpenter testimony, which California has omitted from her quotation of that testimony:

---

[36] *Hearings on H.R. 6251,* at 162-63, Ariz. Legis. Hist. 9.

> "The water which is stored by the Government at its own expense would be disposed of by contract as provided in this bill. There should be that privilege given Arizona to secure water on the same terms as is afforded to Nevada and California."[37]

California also disregards the following legislative history of §5, which further shows the definite understanding of Congress that that section empowered the Secretary of the Interior to make a contractual allocation of water among the Lower Basin states.

In May, 1928, when the fourth Swing-Johnson bill, H. R. 5773, was debated in the House, the effect of §5 was discussed at length. Mr. Douglas of Arizona stated in opposition to the bill:

> "The bill further provides for congressional amendments of State water codes. Further than that, it vests in the Secretary of the Interior complete and absolute control over the waters of the Colorado below Boulder Dam.
>
> "The compact phase of the measure could be adequately taken care of by a resolution or an act providing for ratification. I point out to Members of the House that there are two very distinct and separable portions of the bill, the first providing for the construction of the project, and the second dealing with allocation of waters as between States."[38]

Mr. Colton of Utah asserted that §5 placed full control over the Colorado River in the United States and he challenged the constitutional power of Congress to do this:

> "So that when you say that the Government of the United States owns and controls waters within that state, can not you see that you strike at the very

---

[37] *Hearings on H.R. 6251,* at 163, Ariz. Legis. Hist. 10.

[38] 69 Cong. Rec. 9623 (1928).

> basis of our industrial life? You are saying that you are going to take it away from the States and place it in the Federal Government, and section 5 of this bill asserts that very principle. It provides that the Secretary of the Interior shall have control of all of the water stored in the reservoir and its delivery to any part of the river below."[39]

Quoting the exact provisions of §5, Mr. Colton commented:

> "If that does not give him absolute control of this water, or if it does not seek to give the Secretary of the Interior absolute control of this water, I can not understand the English language; and, gentlemen, that is exactly what we are objecting to. . . ."[40]

Mr. Colton later responded to remarks made by Congressman Taylor of Colorado, one of the leading advocates of the bill:

> "This undertakes to turn over the right to impound these waters, and section 5 provides that the Secretary of the Interior may arrange to distribute or deliver the water lower down the river and also under the canal that is provided for in this bill. That being true, we declare in effect that the water may be allocated by the Secretary of the Interior, and we declare further that the water may be controlled by him. That means that the Congress and the executive department are now embarking upon the policy of controlling, distributing, and allocating the waters of this river."[41]

---

[39] 69 Cong. Rec. 9648 (1928).

[40] 69 Cong. Rec. 9649 (1928).

[41] 69 Cong. Rec. 9778 (1928). At the time that this debate took place, the §5 requirement that contracts "shall conform to paragraph (a) of Section 4 of this Act" had not yet been inserted therein. Ariz. Legis. Hist. 73-74.

It is impossible to reconcile this legislative history with the California contention that "section 5 . . . was not a delegation of power to the Secretary to make interstate allocations of water by water delivery contracts. . . ." (Cal. Op. Br. 189)

California also boldly asserts that throughout the legislative history of the four Swing-Johnson bills (the last of which culminated in the Project Act) one of the major areas of agreement by proponents and opponents alike was that "Congress could not make an interstate allocation of the waters of the Colorado River system, because interstate compact or litigation in this Court were the only two ways in which an interstate allocation could be accomplished" (Cal. Op. Br. 181).

The legislative history is directly to the contrary. It unequivocally discloses that one of the major areas of *disagreement* between proponents and opponents of the bills was whether Congress had the constitutional authority to make such an interstate allocation of water. We repeat, no one denied that the various Swing-Johnson bills provided for a federal allocation of water among the states. The bitter cry of the opposition was that, because of this federal allocation, the bills constituted an unconstitutional invasion by Congress of the rights of the states. On the other hand, the defenders of the bills argued vigorously for their constitutionality.

During committee hearings in the House in the 68th Congress a matter of principal concern was the power of Congress to deal with the water to be controlled by the proposed dam. L. Ward Bannister, a Denver attorney and recognized authority in the field of water law, testified:

> "Mr. Bannister. Although I think there is a fair question as to the fact of navigability I should say that the Federal Government, if it wishes to, may

exercise all the power it wants to in order to protect navigation.

"Mr. Raker [of California]. Now, what would that be? Just tell the committee.

"Mr. Bannister. That would be power, for instance, to establish locks on the river for the movement of vessels at the lower end of the river; it would also be the power, I should say, to prevent waters being withdrawn from the river by any of the States for irrigation, if the effe . would be to injure navigation.

* * * * * * *

"Mr. Raker. Well, before we start in to do any thing, let us see if the Federal Government has that right.

"Mr. Bannister. Well, I have already stated that, if this stream is navigable—and that is your present assumption—then the Federal Government may do anything on that stream necessary to promote navigability; in other words, it may require the release of all waters from the upper States and the lower States both."[42]

In the course of these hearings, much time was devoted to seeking a method of protecting the Upper Basin states in the absence of seven-state ratification of the Compact. William J. Carr, a California attorney representing the Boulder Dam Association, suggested that conditions should be attached to the use of water in the Lower Basin:

". . . But take the regulated flow of the river below the dam; that water will be diverted almost entirely, at least in canals that will be built by the Government, *and there will have to be some appropriate contractual arrangement before that water is put to beneficial use there and a water right is cre-*

[42] *Hearings on H. R. 2903,* at 180-81.

ated, and it would be perfectly proper in the bill to provide the conditions under which any right should be created.

* * * * * *

"Mr. Swing. *May I paraphrase your idea this way? Your position is that Congress has a right to put a limitation upon any person who seeks to benefit by the works which it constructs under this act?*

"Mr. Carr. *Yes.*"[43]

Ottamar Hamele, Chief Counsel for the Bureau of Reclamation, stated his opinion that Congress not only could apportion water between the Upper and Lower Basins, but also could apportion the water allocated to the Lower Basin among Arizona, California and Nevada. He suggested that the following sentence be added to §8 of the pending bill:

> "That every contract made under this act involving any right to the use of water from the development provided for herein shall be made subject to the provisions of the Colorado River compact negotiated at Santa Fe, New Mexico, dated November 24, 1922, and on file with the Department of State."

Mr. Hamele then testified:

> "Mr. Hayden. Then, if it is possible by the language that you have suggested to effect an apportionment between the upper and lower basins without the approval of the compact, *is it also within the power of the Congress to apportion the waters allocated to the lower basin by the compact between the States of Arizona, Colorado, and Nevada by a similar limitation?*
>
> "Mr. Hamele. *I think it is.*"[44]

---

[43] *Id.* at 567, 571.
[44] *Id.* at 881-82.

During the hearings on S. 727, the companion bill to H.R. 2903, Senator McNary elicited the following testimony from Mr. Childers, attorney for Imperial Irrigation District:

> "The Chairman. *Yes. Under a certain section of this bill, as I recall it, the Secretary of the Interior could allocate these waters among the different States for the purpose of irrigation.*
>
> "Mr. Childers. *I think that is true.*"[45]

Evolution of a plan for protection of the Upper Basin and development of the formula for apportionment of water among the Lower Basin states continued in the 69th Congress during discussions of the third Swing-Johnson bill. Its proponents asserted the constitutional power of the federal government to take control and dispose of the water of the river. This was vigorously challenged by the measure's opponents, particularly Senator (then Congressman) Hayden of Arizona and Congressman Leatherwood of Utah. But no one denied that the bill, as it was developing, was designed to allocate water among the Lower Basin states.

Mr. Hayden objected that the bill would vest control of the water in the federal government:

> "Mr. Hayden. . . . I doubt very much whether Representatives in Congress from the arid West, where the doctrine of riparian rights does not and has never prevailed, will be in any hurry to accept the theory of this bill that Congress can make appropriations of water; that Congress, without the consent of the State, can take water for beneficial use for power or irrigation or other purposes.
>
> "Mr. Leatherwood. Without the consent of the State?

---

[45] *Hearings on S. 727 Before the Senate Committee on Irrigation and Reclamation*, 68th Cong., 2d Sess. 155 (1924).

"Mr. Hayden. Not only without the consent of the State but utterly ignoring the State, *yet such are the terms of this bill.* It represents the first attempt to pass legislation by Congress whereby the Federal Government is assumed to have that power."[46]

That this would be the effect of the measure was also recognized by Congressman Leatherwood and Charles P. Squires, a member of the Colorado River Commission of Nevada:

"Mr. Leatherwood. Do you realize that this bill practically nationalizes the river?

"Mr. Squires. Yes, sir.

"Mr. Leatherwood. Do you favor that?

"Mr. Squires. We are perfectly willing that the project shall be under the control of the Federal Government.

"Mr. Leatherwood. Do you favor the policy outlined in this bill of the Government going ahead and doing that by ignoring the several States and their rights?

"Mr. Squires. I favor the Government building the dam."[47]

S. G. Hopkins, Colorado River Commissioner of Wyoming, stated his opinion that Congress could take control of the water and would do so under the proposed bill:

"We found that if the Government constructs this dam for the purpose of flood control, and that is ostensibly the primary purpose of the act, and then incidentally the waters are used for the purpose of generating power and irrigation, that the court would be pretty likely to sustain the act.

* * * * * *

[46] *Hearings on H. R. 6251*, at 16. Mr. Hayden expressed the same views in the Minority Report on H. R. 9826. H. R. Rep. No. 1657, 69th Cong., 2d Sess. (pt. 3) 1 (1927).

[47] *Hearings on H. R. 6251*, at 43.

"... If the Government constructs this reservoir you have only to go to the Government and obtain your water contracts and irrigate your land."[48]

The majority of the House Committee stated in favorably reporting out H.R. 9826:

> *"All rights respecting water or power under the project are, under the terms of the bill, to be disposed of by contract by the Government.* It is not reasonable to assume that the Government will do anything of an unfair or prejudicial nature to Arizona."[49]

The fourth Swing-Johnson bills were introduced in the 70th Congress and again there was no dispute that they would vest control of the river in the federal government and depart from the doctrine of prior appropriation.

Congressman Arentz of Nevada was very plain in stating his views:

> "There must be a definite statement in this bill; *if there cannot be a State compact arrived at among the lower-basin States—there must be a statement in this bill of an allocation among the lower-basin States. What else can you do?*"[50]

Governor Dern of Utah again opposed the legislation:

> "The Swing and Johnson bills propose an entirely new and revolutionary national policy.
>
> * * * * * *
>
> "The theory advanced by attorneys for the Bureau of Reclamation, and embraced in the Swing and Johnson bills, that Congress has the power to

[49] H. R. Rep. No. 1657, 69th Cong., 2d Sess. 11 (1926).

[50] *Hearings on H. R. 5773 Before the House Committee on Irrigation and Reclamation,* 70th Cong., 1st Sess. 51 (1928) (hereinafter referred to as "*Hearings on H. R. 5773*").

allocate and apportion the waters of any Western river among the States, regardless of their will, is abhorrent to our whole plan of government. It proceeds from the vicious bureaucratic hypothesis that in all the Western States the United States, and not the States, owns and may dispose of the waters of any stream, and that Congress at any time may wholly remove the control of such waters from the States, as is attempted in this bill; and that the States exercise their control by mere sufferance.

* * * * * *

"*Under the Johnson bill the essence of the compact idea is almost removed, and the Federal Government is given outright authority to divide the water of the river.* That the division is to be made according to the terms of the Colorado River compact is a mere incident. *The scheme is Federal division of the water, and the compact is no longer a compact but merely a formula.* If Congress at this session can divide the river according to this formula, then a future Congress, again succumbing to the pressure of intensive propaganda, may amend the law and divide the river according to some other formula without consulting the States at all."[51]

On the other hand, Mr. Childers, attorney for Imperial Irrigation District, appeared before the House Committee in support of the legislation and testified that he believed Congress could and should provide for an allocation of water in the Lower Basin:

"It is somewhat doubtful if a compact respecting these questions, solemnly approved by the legislatures of the several States and by the Congress, would of itself be so effective as a means of allocating and administering the allocation of water as an act of the Congress. Compacts for this purpose

[51] *Id.* at 208-09, 215.

have not been adjudicated, just how rights will be affected are not known, and the question of State and Federal control has not been settled."[52]

Francis C. Wilson, appearing before the Senate Committee as a representative of the Governor of New Mexico, testified:

"Senator Hayden. But unless there were some direct constitutional question involved, wherein authority had been conferred upon the Congress, such apportionment could not be made.

"Mr. Wilson. No; it could not be made. In other words, in this connection as I see it the Congress is passing a law which has to do with the regulation of the Colorado River for the betterment of commerce, to make it more navigable. Incident to that power the Congress can take jurisdiction as I view it over the water of the Colorado River to the extent necessary to execute that authority. *If it is important to the execution of that authority that there should be some allocation between the States of the water, I think the Congress could so act in this connection.*"[53]

The favorable report of the majority of the Senate Committee, *submitted by Senator Johnson,* stated in part:

"Here finally is presented a unified plan for protecting those entitled to protection, *for the allocation among the States desiring that allocation of the waters of a great river to which all are entitled,* for the elimination of intolerable conditions by which a fertile and productive part of the United States is dependent for its very life upon water which flows through Mexican territory, and finally for converting

[53] *Hearings on S. 728 and S. 1274 Before the Senate Committee on Irrigation and Reclamation,* 70th Cong., 1st Sess. 194 (1928).

> into a great national asset a wasteful and destructive agency, and by its control reclaiming for homes for Americans, land now arid and worthless.''[54]

During the Senate debate on the bill in the First Session of the 70th Congress, Senator Smoot of Utah epitomized the views of the opposition when he said:

> "The bill is predicated upon the assumption that the Federal Government has very much greater rights in the Colorado River and older streams generally in the country than has ever been recognized by any judicial tribunal. *Indeed, the theory upon which this bill must be upheld, if it is upheld at all, is that the Federal Government is sovereign over the Colorado River, and that Congress may determine how the waters of the Colorado should be divided between the States.*''[55]

The development of the requirement of the California Limitation Act and the change from an allocation by secretarial contract to the imposition of a mandatory formula for allocation created by the interaction of §§4(a), 5 and 8(b), which took place during the Senate debates in the Second Session of the 70th Congress, has been fully reviewed in our opening brief (Ariz. Op. Br. 38-46, 83-99).

These excerpts from the legislative history, although extensive, are but a few of the many which could be quoted upon this point.[56] All demonstrate a clear recognition that

the Swing-Johnson bills, if enacted, would impose complete federal control over the water of the Colorado River in the Lower Basin and would provide for a federal allocation of that water among the Lower Basin states. The major controversy was whether Congress had constitutional power to accomplish this purpose. This question was not settled until the decision in *Arizona* v. *California,* 283 U. S. 423 (1931), which sustained the constitutionality of the Project Act.

In view of this overwhelming historical evidence, there is no justification for California's assertion that

> "... one of the major areas of legislative agreement expressed throughout the legislative history of the four Swing-Johnson bills (the last of which culminated in the Project Act) by proponents and opponents of the measure alike [was that]: Congress could not make an interstate allocation of the waters of the Colorado River system, because interstate compact or litigation in this Court were the only two ways in which an interstate allocation could be accomplished." (Cal. Op. Br. 181)

(3) Senators Quoted by the Special Master

California takes issue with the Special Master because he relies on certain statements made by Senators Hayden and Pittman and a colloquy between Senators Walsh and Johnson, which California calls "confused" (Cal. Op. Br. 182-88).

(pt. 2) *passim* (Minority Report).

See also Arizona's Legislative History for excerpts from the Senate debate in the 70th Congress.

The colloquy between Senators Walsh and Johnson (quoted at Rep. 156-58) is far from "confused". The question under discussion was whether the Secretary of the Interior would be required to recognize the appropriative rights, if any, of the City of Los Angeles. Senator Johnson, with obvious reluctance, finally conceded that under the pending bill the federal government, acting through the Secretary, could dispose of the stored water without regard to appropriative rights:

> "Mr. Walsh of Montana. If the city of Los Angeles has this enormous appropriation of the waters of the Colorado River, a perfected appropriation or an inchoate appropriation, does it follow, if the Government erects this dam across the Colorado River and creates a great storage basin, that it must yield up that amount of water to the city of Los Angeles?
>
> "Mr. Johnson. I rather think so, just exactly as if it were a perfected right for irrigation purposes.
>
> "Mr. Walsh of Montana. Yes; but I always understood that the interest that stores the water has a right superior to prior appropriations that do not store.
>
> "Mr. Johnson. Possibly so. What is the point?
>
> "Mr. Walsh of Montana. The point is that apparently, if that is correct, then this expenditure is being made with no right in the Government of the United States to control the water which is stored, but that it must go to those appropriators.
>
> "Mr. Johnson. No; the bill provides that a contract in advance must be made for the storage of water by the Secretary of the Interior.
>
> "Mr. Walsh of Montana. A contract with whom?
>
> "Mr. Johnson. With those who utilize and take and appropriate the water.
>
> "Mr. Walsh of Montana. That is to say, the Government may dispose of the stored water as it sees fit?

"Mr. Johnson. Yes; under the terms of this bill."[57]

Here is a clear and unconfused declaration by one of the bill's sponsors that it would wipe out appropriative rights and that the only way anyone could get any water was under a contract with the Secretary.[58]

California accuses the Master of quoting Senator Hayden out of context and asserts that in the Hayden-King exchange,[59] from which the Master quoted (Rep. 155), Senator Hayden was in fact referring to a "mandatory tri-state compact", which was then a part of his amendment (Cal. Op. Br. 183-86). Senator Hayden's assertion, which California improperly construes as stating "only that the *mandatory* tri-state compact would make an apportionment", was in fact made by him in response to Senator King's contention that, before Congress would be justified in appropriating funds for construction of Hoover Dam, the bill should expressly provide for a judicial determination of all water rights. Senator Hayden declared that his amendment was intended merely to provide for an interstate apportionment of water and that the determination of individual rights intrastate would be left to the state courts.

California's claim (Cal. Op. Br. 186-87) that the Master quotes Senator Pittman (Rep. 155) out of context is also without foundation. Senator Bratton had objected to

---

[57] 70 Cong. Rec. 168 (1928), Ariz. Legis. Hist. 40-41.

[58] The other sponsor of the bill, Congressman Swing, expressed similar views (see pp. 18-20, *supra*).

[59] The extent of California's misrepresentation of the meaning of this exchange in stating that the Special Master "quotes the ambiguity and omits the clarification" (Cal. Op. Br. 186) can only be appreciated by reading the remarks of Senators King and Hayden in full. The text appears at 70 Cong. Rec. 168-69 (1928), Ariz. Legis. Hist. 44-46.

imposing a tri-state compact on the states. Senator Pittman expressed disagreement and pointed out that the states had been unable to agree on a division of water, so that it became the "duty of the United States Senate to settle this matter. . . ."[60] There can be no doubt as to Senator Pittman's understanding, since he repeatedly stated that the bill was making an interstate apportionment of water (Ariz. Op. Br. 93-97). Even after the tri-state compact provision proposed by Senator Hayden had been amended to make it permissive rather than mandatory, Senator Pittman observed:

> "We have already decided as to the division of the water, and we say that if the States wish they can enter into a subsidiary agreement confirming that."[61]

Undoubtedly, he recognized that the Phipps amendment to §5, which required all contracts for water for irrigation and domestic use to "conform to paragraph (a) of section 4 of this Act", would require all secretarial contracts to be for the quantities specified in §4(a).

(4) Section 8(b)

California also disputes the Master's construction of §8(b). He concluded:

> "The intention to exert authority over the allocation and distribution of water stored in Lake Mead can likewise be derived from Section 8(b) of the Act. That section contemplates that Arizona, California and Nevada, or any two of them, might negotiate a compact for the equitable division of Colorado River water but provides that such a

[60] 70 Cong. Rec. 471 (1928), Ariz. Legis. Hist. 130.

[61] 70 Cong. Rec. 471 (1928), Ariz. Legis. Hist. 131.

> compact shall be subject to water delivery contracts made by the Secretary of the Interior prior to congressional approval of such compact." (Rep. 151)[62]

California argues that this interpretation is wrong because the Master's construction of §5 is wrong (Cal. Op. Br. 188-91). California's §5 argument has already been disposed of (pp. 25-47, *supra*).

California further contends that any §8(b) compact would have related only to power or the price (not allocation) of water. Cited in support of this position is a letter of Secretary Wilbur dated May 9, 1930 to Governor Phillips of Arizona.[63] Far from supporting California's position, however, the letter reflects the Secretary's recognition that contracts made by him under §5, whether for power or the delivery of water, would have precedence over any interstate compact concluded after January 1, 1929 with respect either to power or the apportionment of water. Arizona had objected to power contracts which had been executed by the Secretary before the termination of pending negotiations between California and Arizona looking toward an interstate compact "covering power questions as well as water" (Cal. Op. Br. 190-91 note 6). The Secretary responded in his letter of May 9, 1930 that before signing these power contracts the Department of the Interior had waited "until the states had had an opportunity under section 8(b) to compact on or before January 1, 1929, as the law allows . . ."; and he added that the Department had delayed action until April 28, 1930 "in the earnest hope that the states would be able to work out their problems. . . ." In short, realizing that his contracts would have priority over any interstate compact entered into after

---

[62] Arizona's construction of §8(b) appears at Ariz. Op. Br. 83-88.

[63] C 1835 (Tr. 12,256).

January 1, 1929, the Secretary deferred making such contracts until he felt that he could not justify further delay.

Moreover, it is ridiculous to contend, as California does (Cal. Op. Br. 175), that Congress would impose upon the Secretary the obligation of securing contracts which would provide revenue adequate to repay the cost of the project and then turn right about and authorize the states to compact as to power and the price of water.

The language of §8(b) is plain. It provides authority for the three states, or any two of them, to compact "... for the equitable division of the benefits, including power, arising from the use of water...." This means *all* benefits, including the use of water, subject to the condition that any such compact concluded after January 1, 1929 would be subordinate to all contracts theretofore made by the Secretary under §5.

California concludes its argument on this point by saying:

> "If proponents of section 8(b) had attributed to the proviso of that section the interpretation which the Master derives, its legislative history would have been marked by hot debates about the inclusion of this language of section 8(b). In fact, the record on section 8(b) is singularized by relative silence." (Cal. Op. Br. 191) (footnotes omitted)

But the legislative history of this section[64] discloses that, once again, California is wrong on all points: (1) The record is not silent on this section, (2) the proponents did attribute to it the interpretation derived by the Master and (3) despite the fact that they did so, the legislative history is not marked by hot debates on the subject.

The underlying principle of §8(b) was first suggested in the 69th Congress by Charles P. Squires, a Nevada

---

[64] Ariz. Legis. Hist. 133-43.

Colorado River Commissioner, representing the Governor of that state. H.R. 6251, the bill then pending before the House Committee, provided in §8(a):

> "That the United States, in managing and operating the dam, canals, and other works herein authorized, including the delivery of water for the generation of power, irrigation, or other uses, shall observe and be subject to and controlled by the Colorado River Compact as signed at Santa Fe, New Mexico, on November 24, 1922 and particularly described in section 13 herein.[65]

Mr. Squires proposed an amendment to this section with the following explanation:

> "I would respectfully suggest to your committee that a clause be added to the committee print bill now under consideration, directing that the Secretary of the Interior, in the allocation of rights, shall make such allocation in accordance with the terms of a compact now in process of negotiation between the States of Arizona, California, and Nevada, provided such a compact shall be negotiated and ratified by the legislatures of said three States and consent thereto be given by Congress on or before March 4, 1927.
>
> "Such a clause, permitting Arizona, California, and Nevada to proceed with the orderly and peaceful solution of their own problems, *but leaving the Secretary of the Interior free to act under the terms of the bill as now drawn in case no agreement is arrived at,* may be added, substantially as follows:
>
> "Page 9, section 8(a), line 7, add, following the word 'herein':

[65] *Hearings on H. R. 6251,* at 3, Ariz. Legis. Hist. 133.

'and by the terms of a compact between the States of Arizona, California, and Nevada for the division of the benefits accruing to said three States, under said Colorado River compact, provided such a compact between said three States shall be negotiated and ratified by the legislatures thereof and consent thereto be given by Congress on or before March 4, 1927.' "[66]

Mr. Squires further explained the purpose of his proposal in answer to questions of Congressman Hayden:

"Mr. Hayden. We are willing to concede that whatever time may be necessary should run to perfect the plan of the original Colorado River compact, but you would set a time limit within which Arizona shall come to an agreement with California and Nevada. Does that appeal to you as entirely fair?

"Mr. Squires. Yes, sir; because there is a year in which to carry it out, and if then it can not be carried out, I suppose we would have to abandon that idea.

"Mr. Hayden. Why not put the same time limit on the approval of the Colorado River compact itself?

"Mr. Squires. This practically does it, I think, because a tri-State compact, which would be an agreement between the three States, would I assume, be predicated upon the terms of the seven-States Colorado River compact.

"Mr. Hayden. *If Congress can legislate after the time limit has expired, what is the necessity of any agreement at all?*

"Mr. Squires. *I think the necessity for action demands that there be legislation.*

"Mr. Hayden. *Regardless of whether the States agree or not?*

---

[66] *Hearings on H. R. 6251*, at 39, Ariz. Legis. Hist. 134-35.

"Mr. Squires. *I think so.* I think we are leaving the door wide open with an invitation to Arizona to come with us, and it is our desire and hope that that will be done."[67]

H. R. 6251 was later replaced by H.R. 9826 and a committee print of April 14, 1926 contained the Nevada proposal in §8(d).[68]

When Senator Hayden directed attention to this provision, Delph Carpenter of Colorado testified:

"Mr. Hayden. I desire to inquire as to the desirability of fixing a time limit, such as March 4, 1927, within which the State of Arizona must agree?

"Mr. Carpenter. I have been fearful that the section would be misconstrued in the very manner that you suggest. I think it is the intent of the framers of the amendment that the compact when entered into and approved by Congress should be controlling upon the works herein authorized, *but*

---

[67] *Hearings on H. R. 6251,* at 41.

[68] "Also the United States, in constructing, managing, and operating the dam, reservoir, canals, and other works herein authorized, including the appropriation delivery and use of water for the generation of power, irrigation, or other uses, and all users of water thus delivered and all users and appropriators of waters stored by said reservoir and/or carried by said canal, including all permittees and licensees of the United States or any of its agencies, shall observe and be subject to and controlled, anything to the contrary herein notwithstanding, by the terms of such compact, if any, between the States of Arizona, California, and Nevada, for the equitable division of the benefits including power, arising from the use of water accruing to said States, subsidiary to and consistent with said Colorado River compact, which may be negotiated and approved by said States and to which Congress shall give its consent and approval on or before March 4, 1927; and the terms of any such compact concluded between said States and approved and consented to by Congress after said dates; Provided, That in the latter case such compact shall be subject to all contracts, if any, made by the Secretary of the Interior under Section 5 hereof prior to the date of such approval and consent by Congress." *Hearings on H. R. 6251,* at 117-18.

they wish to fix a reasonable time within which to arrive at a compact to deal with the waters with perfect freedom, knowing that if the Secretary of the Interior enters into contracts for disposition of water and power to be generated, that any compact between the three States would confront those contracts, and the three lower States might be put in a position of recognizing those contracts irrespective of their effect upon any one State. It was the thought of the framers of the amendment to stay the hand of the Secretary of the Interior in any such contracts for such a time as may be necessary for the three lower States to conclude a compact. That is the reason for inclusion of the date.''[69]

And so the proponents of §8(b) made it perfectly clear that it was their intention to allow the states complete freedom until January 1, 1929 to make a division of the water by compact different from that specified in §4(a), but that after that date the hand of the Secretary to contract pursuant to the division among the states approved in §4(a) should no longer be stayed. If, after January 1, 1929, the states should compact for an allocation of water differing from that approved in §4(a), any such compact should be subject to prior contracts made by the Secretary pursuant to the authority and direction of §§5 and 4(a) (Ariz. Op. Br. 85-86). After enactment of the Project Act, the Secretary of the Interior, as we have seen, construed §8(b) in precisely the same way (see pp. 48-49, *supra*).

F. Section 6 of the Project Act

The Special Master has held (Rep. 308-11) that the only appropriative rights in the Lower Basin which survived the Project Act are the "present perfected rights" referred to in §6:

---

[69] *Hearings on H. R. 6251,* at 204, Ariz. Legis. Hist. 140-41.

> "That the dam and reservoir provided for by section 1 hereof shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and *satisfaction of present perfected rights in pursuance of Article VIII* of said Colorado River compact; and third, for power."[70]

The Master has construed §6 as preserving whatever rights to main stream water were perfected in Arizona, California and Nevada when the Project Act became effective on June 25, 1929.

California takes issue with this construction as too narrow, contending that principles of prior appropriation survived the Project Act and govern all interstate rights in the Lower Basin whether acquired before or after June 25, 1929 (Cal. Op. Br. 217-21). In effect, California reargues her basic position regarding the survival of appropriative rights, with which we have dealt previously (pp. 8-53, *supra*).

Arizona disagrees with the Master's construction of §6, and even more so with California's position. As we stated in our opening brief:

> "It is our view that §6 of the Project Act does not recognize or confirm any rights within the Lower Basin at all. Section 6 merely directs that the facili-

---

[70] Article VIII of the Compact provides:

> "Present perfected rights to the beneficial use of waters of the Colorado River System are unimpaired by this compact. Whenever storage capacity of 5,000,000 acre-feet shall have been provided on the main Colorado River within or for the benefit of the Lower Basin, then *claims of such rights, if any, by appropriators or users of water in the Lower Basin against appropriators or users of water in the Upper Basin shall attach to and be satisfied from water that may be stored not in conflict with Article III.*
>
> "*All other rights to beneficial use of waters of the Colorado River System shall be satisfied solely from the water apportioned to that Basin in which they are situate.*"

> ties authorized by §1 shall satisfy the requirements of Article VIII of the Compact—that claims of rights by appropriators and users in the Lower Basin against appropriators and users in the Upper Basin shall attach to and be satisfied from water stored in the Lower Basin. The only portion of Article VIII of the Compact which provides for 'satisfaction' of present perfected rights is the second sentence of the first paragraph and this provision is clearly limited to the satisfaction of perfected rights basin versus basin." (Ariz. Op. Br. 47-48)

After a review of the circumstances existing when the Compact was negotiated, the conclusion was reached that:

> "Thus by the device of preserving perfected rights *basin versus basin* until storage was available, protection was afforded main stream Lower Basin users. After storage was provided as contemplated by Article VIII of the Compact, the first sentence of Article VIII had served its purpose and had no further effect." (Ariz. Op. Br. 49)

Further reflection and analysis of this question, including consideration of the arguments advanced by California, has served only to strengthen our belief in the correctness of this conclusion.

Indeed, as we have previously noted (pp. 18-20, *supra*), Mr. Swing, co-sponsor of the Project Act, expressed these very same views shortly after the Compact was signed.[71]

California repeats her misstatement, based upon a distorted version of testimony by Delph Carpenter, that §6 of the Project Act was inserted at the instance of the

---

[71] See also the testimony of Judge Davis, the Compact Commissioner from New Mexico. *Hearings on H. R. 2903*, at 1769-70.

Upper Basin and was not intended "to affect rights of Arizona and California *inter sese*" (Cal. Op. Br. 219; and see 177-81). Actually, in discussing the provisions of §6 that the dam and reservoir should be used, among other purposes, for "satisfaction of present perfected rights," Mr Carpenter stated:

> "Mr. Carpenter. In lines 1 and 2 the words 'and satisfaction of present perfected rights in pursuance or Article VIII of said Colorado River compact' were inserted by the upper basin States for the reason that the paragraph as drawn did not affirmatively recognize the obligation imposed by Article VIII of the compact to take care of present perfected rights, drawing water from the river below the dam. Article VIII provides that when a reservoir of 5,000,000 acre-feet or more has been constructed in the canyon for the benefit of the lower basin those perfected rights shall look to the reservoir for their supply. We would be sure that there be no question about that. The lake under consideration should perform that duty, along with other duties.
>
> "Mr. Hudspeth. In other words, the lands in the Imperial Valley shall look to this reservoir for their supply of water."[72]

The fact that the portion of §6 referring to "present perfected rights" originated with the Upper Basin is further proof that it was intended to preserve such rights only basin versus basin, until storage was provided, for the Upper Basin had no concern with, nor interest in, the preservation of perfected rights interstate in the Lower Basin.

---

[72] *Hearings on H. R. 6251,* at 167. The testimony of Mr. Carpenter quoted at 177-81 of California's Opening Brief referred to §5 not §6 of the Project Act, despite the fact that California, in her argument as to the meaning of §6, at page 219 of her Opening Brief, refers back to pages 177-81 as though Carpenter's testimony in fact concerned the meaning and purpose of §6.

The foregoing provides cogent evidence that §6 of the Project Act was not intended to confirm rights within the Lower Basin nor to preserve any such rights beyond the time when storage capacity, as contemplated by Article VIII of the Compact, was provided. Therefore, there are no "present perfected rights" in Lower Basin main stream water today which have survived the construction of Hoover Dam and the creation of Lake Mead.

G. Summary

To summarize: None of the grounds advanced by California—neither the provisions of the Project Act, nor its legislative history, nor its administrative, practical, or subsequent congressional construction—supports the California position that the Project Act confirmed and did not abrogate the doctrine of prior appropriation and principles of equitable apportionment. To the contrary, these very sources establish the intent of Congress, absent an interstate compact, to make a statutory allocation of water among Arizona, California and Nevada, which, as the Master correctly found, renders the doctrine of equitable apportionment and the law of prior appropriation irrelevant to the decision of this case (Rep. 138).

II

The interpretation of the limitation on California is not controlled by the meaning of the Compact, as California contends, but by the intent of Congress as manifested in the Project Act and its legislative history.[73]

A. The Basic Question

The basic question involved in the construction of the California limitation is:

> Whether the references in §4(a) of the Project Act and in the Limitation Act to [1] "the waters apportioned to the lower basin States" by Article III(a) of the Compact and [2] "excess or surplus waters unapportioned" by the Compact mean main stream water only or include both main stream and Lower Basin tributary water

B. California's Approach to the Question

California's position before the Master regarding these clauses was ambivalent and inconsistent (Rep. 180 note 40). She insisted that the first phrase—"the waters apportioned to the lower basin States" by Article III(a) of the Compact—must be construed in the Compact sense, *i. e.*, as referring to the same water as that to which the Compact referred. The Compact, she said as she does now, referred

---

[73] This point is directed principally to a refutation of Part Two of California's Opening Brief, pages 69-137.

Arizona contends that Congress correctly interpreted Article III of the Compact as referring solely to main stream water (see Ariz. Op. Br. 72-81). But for purposes of this argument only, we shall assume that California's construction of Article III(a) of the Compact is correct.

to *system* water (main stream and tributaries).[74] But with respect to the second clause—"excess or surplus waters unapportioned" by the Compact—California took quite a different view. She argued:

> "Resolution of this issue does not turn on whether the negotiators of the compact intended to classify the waters specified in Article III(b) as 'apportioned.' Rather the issue is whether Congress intended to exclude California from participation in Article III(b) water. *The true question is what Congress* (and the California legislature in complying 'with the conditions respecting limitation' in the Project Act) *intended in 1928, not what the negotiators of the compact intended in 1922.*"[75]

The Master has sustained this California position with respect to III(b) water. He holds that, literally construed, the words "excess or surplus waters unapportioned" by the Compact would exclude California from any share in the water referred to in Article III(b) of the Compact, which he properly holds is "apportioned" water in the Compact sense. But, accepting California's reading of the legislative history of §4(a), the Master concludes that Congress did not intend to exclude California from a share in surplus water in excess of the first 7.5 million acre-feet of main stream water in the Lower Basin in any one year. Therefore, giving effect to the congressional intent that "unapportioned" water should include Article III (b) water, the Master recommends that California be decreed the right to share equally with Arizona in the 1,000,000 acre-

---

[74] Article II(a) of the Compact defines the Colorado River System as "that portion of the Colorado River and its tributaries within the United States of America".

[75] Brief of the California Defendants before the Special Master, A2-5.

feet apportioned by Article III(b) of the Compact (Rep. 194-200).[76]

Arizona's concession that the Master's construction of the §4(a) phrase, "excess or surplus waters unapportioned" by the Compact, is sound has rendered the Article III(b) question academic (Ariz. Op. Br. 82). However, it is significant that California has contended successfully before the Master that simply because §4(a) refers to the Compact it does not at all follow that "the meaning of the Compact controls" and that " 'Compact' means Compact" (Cal. Op. Br. 70, 133-37). Indeed, in her Opening Brief California does not hesitate to argue for what she claims is a "sensible" reading of the Compact when a literal interpretation operates to her disadvantage (Cal. Op. Br. 93).

In dealing with the interpretation of clause [1]—"waters apportioned to the lower basin States" by Article III(a) of the Compact—California furloughs her historiographers and puts her literalists in command. She has bottomed her position upon an over-simplified and purely theoretical equation:

> Project Act = Compact = System water (main stream + tributary)

Or in terms of an equally over-simplified and theoretical syllogism:

> Congress in §4(a) employed the phrase "waters apportioned to the lower basin States" by Article III(a) of the Compact.

---

[76] Having thus persuaded the Master, California now contends that a "literal reading" of the phrase also achieves the same result (Cal. Op. Br. 73-74). California modifies her position as to clause [2] in order to make it consistent with her position as to clause [1].

> Article III(a) of the Compact apportioned water of the Colorado River system.
>
> *Ergo,* Congress employed this phrase in §4(a) to mean water of the Colorado River system.

Entirely left out of the equation and the syllogism is this vital factor: What did the phrase really mean in the vocabulary of Congress—*what water was Congress talking about?* California pays little or no attention to the extensive legislative history of §4(a), which led the Master to conclude:

> "Certainly Congress intended that the water, to a portion of which California was limited by Section 4(a), would be mainstream water only." (Rep. 174)

California's unrealistic and myopic approach to the problem of interpretation vitiates all of her discussion of it. Although she accepts the Master's construction of the Compact as dealing with system water, she would have the Court reject his conclusion that in formulating the limitation on California Congress intended to and did deal with main stream water only (Cal. Op. Br. 80, *et seq.*).

C. Legislative History

The legislative history shows conclusively that in formulating the California limitation both Congress as a body and the congressional representatives of California in particular understood and agreed that "paragraph (a) of Article III of the Colorado River compact" meant and referred to main stream water only.

California purports to rely on this legislative history, but actually pays only lip-service to it (Cal. Op. Br. 118-24) and ignores the many instances in which the intent of Congress to deal only with main stream water in the Project

Act was clearly and repeatedly expressed (see Ariz. Op. Br. 60-67).

Indeed, California's only comment upon the statements of Senators Pittman, Hayden and Johnson, made during the debate on §4(a) and relied upon by the Special Master as showing they were talking about main stream water only (Rep. 174-80), is that Senators Pittman and Hayden were "confused" and that Senator Johnson's statements "were not always consistent" (Cal. Op. Br. 122-23).

The Pittman-Hayden confusion, if any, concerned the relationship between Article III(a) and (d) as used in the Compact (Rep. 188-90). They were certainly not "confused" regarding the meaning of §4(a) of the Project Act, as their discussion of its provisions on the Senate floor demonstrates beyond dispute. Senator Johnson was equally clear that §4(a) dealt with main stream water only.

Immediately before the Hayden amendment to §4(a) was put to a vote in the Senate, Senators Johnson and Hayden debated how any Mexican treaty burden should be shared between Arizona and California. They both displayed a clear and definite understanding that §4(a) dealt with main stream water only and that the California limitation of 4,400,000 acre-feet and the Arizona allocation of 2,800,000 acre-feet refer to main stream water only:

> "Mr. Johnson. All right. Now, in the division of water that the Senate saw fit to impose yesterday Arizona had 2,800,000 acre-feet, and 3,500,000 acre-feet from the Gila, did it not?
>
> "Mr. Hayden. Correct.
>
> "Mr. Johnson. Making 6,300,000 acre-feet. California was given, with its claims and its perfected rights, 4,400,000 acre-feet. That is correct, is it not? All right. Now, you wish to deduct from the burden that is imposed by water that goes to Mexico, first, 3,500,000 acre-feet, do you not?

"Mr. Hayden. I do.

"Mr. Johnson. Then you wish to put upon California and Arizona—one of them having then 2,800,000 acre-feet and the other 4,400,000 acre-feet remaining—the burden in equal shares, do you not?

"Mr. Hayden. I do.

"Mr. Johnson. All right. That is just what I wanted to demonstrate.

"Mr. Hayden. The Senator is unwilling to do that?

"Mr. Johnson. Of course I am unwilling to do that.

* * * * * *

"Mr. Johnson. Let us say, just by way of example, that 2,000,000 acre-feet would be utilized by Mexico. I am unable to say how much it would be; but a while ago some Senator upon the floor used that as an example—that 2,000,000 acre-feet might be ultimately allotted to Mexico. Under your plan, then, 1,000,000 acre-feet would have to be borne by California and 1,000,000 acre-feet by Arizona, would it not?

"Mr. Hayden. Yes.

"Mr. Johnson. That would leave, then, for California, 3,400,000 acre-feet.

"Mr. Hayden. And for Arizona, *in the main stream,* 1,800,000.

"Mr. Johnson. *Yes; with 3,500,000 added thereto from the Gila.*"[77]

In the foregoing exchange, Senators Johnson and Hayden were discussing §4(a) as it had been altered by the "perfecting amendment" of Senator Phipps, which added the words "paragraph (a) of Article III".[78] Contrary to California's contention, Senator Phipps did not intend, nor did Senators Johnson and Hayden understand,

[77] 70 Cong. Rec. 468 (1928).

[78] 70 Cong. Rec. 459 (1928).

that the Phipps' amendment would have the effect of making §4(a) refer to system water rather than to main stream water only. Shortly before perfecting his amendment, Senator Phipps clearly indicated his understanding that the limitation on California applied only to water sent down the river from the Upper Basin, *i.e.*, main stream water:

> "Just in a word, I wish to state that my understanding of the effect of the pending amendment is that under it or under a 7-State compact, the upper States would be compelled to send down 7,500,000 acre-feet [*sic*] of water in 10 years; or, to put it the other way, they would have for their own uses 7,500,000 acre-feet annually. If the 7-State compact is entered into, it settles that question so far as the upper basin States are concerned.
>
> "If we enact this legislation without providing for a 6-State compact, the discussions and the differences between the lower basin States may continue indefinitely and the upper basin States have no assurance that they are going to be protected in what they conceive to be their rights. The language of the amendment providing for a 6-State compact has incorporated in it the engagement upon the part of California that she will not take for her consumptive use more than 4,600,000 acre-feet—or now 4,400,000 acre-feet—of water out of the estimate 7,500,000 acre-feet annual flow."[79]

In an effort to create the impression that Senator Phipps must have understood that the §4(a) references to Article III(a) of the Compact "embraced both the main stream and the tributaries in the lower basin," California also wrenches out of context a colloquy between Senators Hayden and Phipps and emphasizes the following statement of Senator Phipps:

---

[79] 70 Cong. Rec. 390 (1928).

> "'. . . But I do not think that the water from the Gila River, one of the main tributaries of the Colorado, should be eliminated from consideration. I think that California is entitled to have that counted in as being a part of the basic supply of water.'" (Cal. Op. Br. 121)[80]

The Congressional Record establishes, however, that in so stating, Senator Phipps was referring only to Gila River water *which reached the main stream,* since he was under the misapprehension that the La Rue engineering report, which had been submitted to Congress, indicated that a million acre-feet of Gila River water entered the main stream of the Colorado River annually and that Arizona was claiming the right to the exclusive use of this water even after it had reached the main stream. Senator Hayden immediately corrected this misapprehension and made it clear that the million acre-feet discussed by La Rue was not an existing supply, but an anticipated return flow which would occur only if large quantities of Colorado River water were used to irrigate lands in the lower Gila Valley, and that Arizona was making no claim to Gila River water once it became part of the main stream supply.[81]

Thereafter, the Hayden amendment, containing the clause giving Arizona exclusive use of the Gila within her boundaries, was accepted by Senator Phipps as an amendment to his amendment.[82] Thus, in making the statement emphasized by California, Senator Phipps was not at all expressing the view that the proposed limitation on California related to tributaries as well as to the main stream. To the contrary, he was in effect saying that California should be entitled to use within its limitation any water *in the main stream,* regardless of its source.

---

[80] Quoting from 70 Cong. Rec. 335 (1928).

[81] 70 Cong. Rec. 335-36 (1928).

[82] 70 Cong. Rec. 472 (1928).

We have fully reviewed (Ariz. Op. Br. 61-67) the Senate debates in the 70th Congress, all of which support the Master's conclusion that the §4(a) phrase, "waters apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact", was intended to mean water of the main stream only. If supplemental proof were needed, however, it may be found in the record of the hearings on the fourth Swing-Johnson bills before the House and Senate Committees.

T. A. Panter of Los Angeles, presented by Congressman Swing as a witness in support of the bill, testified:

> "Mr. Panter. I said that the compact allocates seven and one-half million acre-feet of water to the lower basin directly.
>
> "Mr. Douglas. *At Lees Ferry.*
>
> "Mr. Panter. *At Lees Ferry.* In addition to this amount Arizona has contended that there is 2,000,000 acre-feet of water *coming down* that is unallocated, or that the upper basin will not use. Now, if that is split, just assuming for example that there is a 50-50 split on that, it would bring a million acre-feet down so far as the California intakes."[83]

Just as it did in the Senate,[84] the proposal of the Upper Basin Governors formed the basis for discussions in the House Committee hearings as to the division of water among the Lower Basin states. Francis C. Wilson of New Mexico testified as the representative of the Governor of that state that he had attended the Governors' Conference of 1927 and that he was among those who formulated the recommendation that:

> "Of the average annual delivery of water to be provided by the States of the upper basin *at Lees*

---

[84] See Ariz. Op. Br. 62-66.

Ferry under the terms of the Colorado River compact, to the State of Nevada, 300,000 acre-feet; to the State of Arizona, 3,000,000 acre-feet; to the State of California, 4,200,000 acre-feet."[85]

Reference was also made in these Committee hearings to a letter written by Mr. Wilson to Congressman Tilson in which he stated:

> "Arizona accepted the suggestion of the governors as regards the division of water *from the main stream* to the extent that those waters are underwritten in the compact by the upper-basin States *at Lees Ferry*. . . ."[86]

Charles Childers, attorney for Imperial Irrigation District, testified as to the basis for California's demand for 4,600,000 acre-feet and stated that California could not accept the Governors' recommendation. He continued:

> "In this statement we are not considering possible surplus water *from the upper basin over and above that allocated by the compact.* It is only in the hope that some water, above the compact allocation, *will flow from the upper basin,* that California made its proposal of approximately 4,600,000 acre-feet as the minimum she could accept. There may be some surplus water, and there may not be, so in all of these discussions we are ignoring surplus water *from the upper basin.*"[87]

D. Significance of California's Position

Why, in the face of the legislative history, does California seek a "literal" reading of the §4(a) phrase "waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact", while at the same time she accepts the congressional non-literal use of the phrase "excess or surplus waters unapportioned" by the Compact? The Master readily comprehended her reasons and motives. He described them thus (Rep. 177-78):

> "The crux of her case lies in the view that the Project Act adopts and applies the Compact method of accounting. Thus California would total all uses of System water in the Lower Basin until the sum of 7,500,000 has been reached, after which she would assign all remaining uses to 'excess or surplus waters unapportioned by said compact.' There being no tributaries in California, the effect of this thesis is, of course, to exhaust the 7,500,000 apportionment with the help of tributary uses outside of California and to leave a large supply of mainstream water which California shares as 'surplus.' The effect of California's accounting system is disclosed in Part XII of her Proposed Findings and Conclusions. The California position is there revealed as follows:
>
> 1. Art. III(a) of the Compact apportioned 7,500,000 acre-feet of uses to the Lower Basin;
>
> 2. Congress limited California to not more than 4,400,000 acre-feet of uses from this apportionment;
>
> 3. California is using all of the 4,400,000 acre-feet;
>
> 4. Thus, 3,100,000 acre-feet of uses remain for other Lower Basin states out of the III(a) apportionment;
>
> 5. The 3,100,000 acre-feet of uses are exhausted in other states, as follows:

(1) Gila River	1,750,000
(2) Other tributaries	200,000
(3) Mainstream, other than California	1,150,000
Total	3,100,000;

6. Any water remaining in the *mainstream* in excess of 5,550,000 acre-feet (4,400,000 for California and 1,150,00 [*sic*] for others) is surplus, of which California may take as much as one-half.

"Under this hypothesis California argues that she is privileged to take as surplus up to 978,000 acre-feet from the mainstream in addition to taking 4,400,000 acre-feet, also from the mainstream, out of what she interprets to be the Article III(a) System apportionment. *The effect of this argument is to give California 5,378,000 acre-feet out of the first 7,500,000 acre-feet available from the mainstream, leaving only 2,122,000 acre-feet for Arizona and Nevada.*" (Rep. 177-78) (footnote omitted; italics the Master's)

That this result was never intended by Congress is clear, and the Master so found. "Nothing", he says,

"in the words or the legislative history of Section 4(a) lends countenance to this hypothesis. The second paragraph of Section 4(a) contemplates that Arizona could receive 2,800,000 acre-feet of the 7,500,000 acre-feet *in addition* to the exclusive use of the Gila River within her boundaries. Under the California hypothesis, over one-half of Arizona's 2,800,000 acre-feet is used up by appropriations on the Gila.

"After the prolonged dispute between Arizona and California, which was uniformly described as a difference over whether California should be lim-

> ited to 4,200,000 or 4,600,000 out of the first 7,500,000 acre-feet of mainstream water, it would be remarkable indeed to discover at this late date that Congress intended *to give California up to 5,378,000 acre-feet of the first 7,500,000 acre-feet of mainstream water and to assure Arizona of only 1,822,000 acre-feet.*" (Rep. 179-80) (footnote omitted; first italics the Master's)

While California insists that her position is "Compact means Compact", her claims to water which she labels "excess or surplus waters unapportioned by the Compact" belie this assertion.

Concededly, California is limited by §4(a) of the Project Act to the "aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River" of 4.4 million acre-feet

> "of the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact."

Article III(a) of the Colorado River Compact provides:

> "There is hereby apportioned from the Colorado River System in perpetuity to the Upper Basin . . . the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum . . ."

California's studies of "safe annual yield" are predicated on the assumption that uses in the Upper Basin will not exceed 6,500,000 acre-feet during any one year. The difference of 1,000,000 acre-feet constitutes a part of the "dependable water supply" for the Lower Basin in the California computation of "safe annual yield" (Cal. Op. Br. 251 note 5).

However, under a literal reading of the Compact, which California urges, this 1,000,000 acre-feet is not "excess or surplus water unapportioned by the Compact", but is water apportioned to the Upper Basin. It would follow, were the Act read literally, that under the provisions of §4(a) and the Limitation Act, California has excluded herself irrevocably and unconditionally from the use of any of this water. Consequently under §§4(a) and 5 of the Project Act, the Secretary could not contract to deliver for use in California any portion of this water, for to do so would violate the plain terms of the California limitation, construed in the literal Compact sense.

Nor, if the Compact is literally incorporated into the Project Act, as California contends, could she presently acquire any firm right to any part of the 1,000,000 acre-feet per annum referred to in Article III(b) of the Compact, for under a literal construction of the Compact this water is also "apportioned" water (Rep. 180 note 40, 194; and see Compact Article III(f)). Hence, California would have no share in the uses specified in Article III(b).

Lastly, if California's pressure for a literal construction is yielded to, she cannot presently acquire a firm right to any part of the "excess or surplus waters unapportioned" by the Compact. This is because under Article III(f):

> "Further equitable apportionment of the beneficial uses of the waters of the Colorado River System unapportioned by paragraphs (a), (b), and (c) may be made . . . at any time after October first, 1963, if and when either Basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b)."

Literally and technically, the Secretary of the Interior has no authority to contract now with California agencies for

the delivery of any portion of the "excess or surplus water unapportioned" by the Compact, because his contracts "shall be for permanent service" (Project Act §5). The Secretary cannot create, nor can California acquire, any vested contractual water right which is thus subject to divestment in the future.

Each of the foregoing results follows, it should be noted, whether the apportionment of water made by the Compact is an apportionment of system water or of main stream water only.

Thus, under a literal construction of the Compact terminology used in the Project Act, California is precluded from any share of (1) water apportioned to but unused by the Upper Basin, (2) water apportioned to the Lower Basin by Article III(b) of the Compact and (3) excess or surplus water unapportioned by the Compact. Therefore, it is only in the event that §4(a) of the Project Act is construed, as the Master properly construes it, in the light of the congressional intent as manifested in the other provisions, the purposes and legislative history of the statute that California is entitled to use water in excess of 4.4 million acre-feet of the water apportioned to the Lower Basin by Article III(a) of the Compact.

E. California's Attack on the Master's Construction of §4(a)

The Master observed that a literal reading of §4(a) "would authorize Arizona, California and Nevada to enter into a compact for the division among themselves of all the Lower Basin system water, including water being used by New Mexico and Utah" (Rep. 171); and that "it is preposterous to suggest that such a result would have been accomplished with the active support of Senator Bratton of New Mexico, one of the principal architects of Section 4(a)" (Rep. 175) (footnote omitted).

To this California responds that "New Mexico and Utah would not and could not be excluded from the use of any water by any compact among Arizona, California and Nevada" to which the states of New Mexico and Utah were not parties; and that "Senator Bratton must have believed —correctly—that clauses (1) and (2) of the tri-state compact to which New Mexico was not a party could not affect her rights" (Cal. Op. Br. 86-87) (footnote omitted).

This implies that Senator (now judge) Bratton was playing a crafty political game. The tri-state agreement envisaged in §4(a) was proposed, together with the California limitation, as an equitable settlement of the long-lasting dispute regarding the division of Lower Basin main stream water. Indeed, this controversy threatened to block *in limine* the authorization of the project which California so urgently desired. Yet California would now attribute to Senator Bratton, when he was strongly urging the acceptance of this compromise, a mental reservation that, although in terms it would "literally" deprive his state of New Mexico of a share in system water, in legal effect it could not do so; and hence he would support advance congressional approval of the proposed tri-state compact by the lip service of his vote. Moreover, the California contention necessarily assumes that Congress would solemnly approve in advance a tri-state compact which, if made, would have no validity or utility, since it purported to apportion among the three compacting states tributary water in which two non-compacting states had vested interests.

The same specious argument is advanced by California (Cal. Op. Br. 91) in response to the Master's further observation that, if read literally, §4(a) would "prohibit the states of the Upper Basin from utilizing any of the water unapportioned by the . . . Compact" (Rep. 171).

This time the same political chicanery is attributed to senators of the Upper Division states, men of the stature of King and Smoot of Utah, Kendrick of Wyoming and Phipps of Colorado, all of whom, as representatives of the Upper Division, were anxious to have the Lower Basin controversy settled and settled if possible by interstate compact. Yet California would impute to them also the purpose to authorize a futile and invalid compact.

Finally, the California position implies that the states of the Upper Basin and New Mexico and Utah (as to their Lower Basin uses) would willingly approve in advance a tri-state compact which would create a cloud upon their rights to participate in a further apportionment of water as contemplated by Article III(f) of the Compact.

California argues further that, in any event, the quantity of water from which Utah and New Mexico would have been excluded under a literal interpretation of §4(a) is "insignificant" (Cal. Op. Br. 90). But water in any amount, however small, is never regarded in the arid West as "insignificant". Indeed, uses on Lower Basin tributaries were considered so significant as to warrant extensive litigation in this very case. Utah claimed the right to an annual consumptive use on tributaries of 125,000 acre-feet[88] and New Mexico 111,700 acre-feet[89] or a total of 236,700 acre-feet annually. This is more than the combined annual quantities which Nevada, New Mexico and Utah would receive under California's proposed decree (Cal. Op. Br. 22-23).[90]

---

[88] Utah's Proposed Finding of Fact 19a.

[89] New Mexico's Proposed Finding of Fact 31.

[90] Although the Master found that there is no justiciable controversy as to any of these tributaries except the Gila River system, he so held only because present uses were not questioned and the claims for possible future uses were not yet ripe for decision (Rep. 321-24).

In discussing the tri-state compact provisions of §4(a) California makes several misstatements (Cal. Op. Br. 85-90). It is not true that the California limitation was required only in the event of Arizona's failure to ratify the Compact; nor is it true, as California proclaims with emphasis, that: "It was *never* contemplated that the tri-state compact and the limitation on California would coexist" (Cal. Op. Br. 89) (italics California's). The California limitation was required if seven states (including Arizona) failed to ratify the Compact *within six months after June 25, 1929* (Project Act §4(a)(2), Ariz. Op. Br. Appendix B, p. 12a). The very fact that the tri-state agreement proposed by §4(a) was to apportion 2.8 million acre-feet to Arizona and .3 million to Nevada out of the 7.5 million acre-feet referred to, shows plainly that the California limitation and the tri-state compact were to coexist and that, as the Master says, the two "are clearly correlative and contemplate allocation of all the available water among the three states" (Rep. 170, 174-75). That the two cannot be regarded separately is clear from the California argument that they can be so regarded: She says that the California limitation is not a "grant" and hence the tri-state agreement of itself would have made no disposition of the 4.4 million acre-feet or of the surplus water referred to in the California limitation. From this California concludes that there would be a residue of 4.4 million acre-feet of Article III(a) water and one-half of the "excess or surplus" available for use in California, New Mexico and Utah (Cal. Op. Br. 89). That this result was never intended by Congress is indubitable. No one ever thought or intended that New Mexico and Utah would share in the water to the use of which California would be limited.

California next represents that:

> "Article 7(g) [of the Arizona contract] constitutes an important administrative construction by the Secretary as well as a practical construction by Arizona that the lower basin rights of New Mexico and Utah are relevant to, and unimpaired by, the Project Act." (Cal. Op. Br. 90)

That this statement is erroneous is demonstrated by the provisions of Article 10 of the Arizona contract, which expressly disclaim any interpretation whatever by the Secretary or by Arizona of the Compact or the Project Act.[91]

Secretary of the Interior Ickes at the time the Arizona contract was executed stated the purpose of Article 10:

> "Secondly, Article 10 was purposely designed to prevent Arizona, or any other state, from contending that the proposed contract, or any provision of the proposed contract, resolves any issue on the amounts of waters which are apportioned or unapportioned by the compact and the amounts of apportioned or unapportioned water available to the respective states under the compact and the act. It expressly reserves for future judicial determination any issue involving

---

[91] Article 10 states:

"Neither Article 7, nor any other provision of this contract, shall impair the right of Arizona and other states and the users of water therein to maintain, prosecute or defend any action respecting, and is without prejudice to, any of the respective contentions of said states and water users as to (1) the intent, effect, meaning, and interpretation of said compact and said act; (2) what part, if any, of the water used or contracted for by any of them falls within Article III(a) of the Colorado River Compact; (3) what part, if any, is within Article III(b) thereof; (4) what part, if any, is excess or surplus waters unapportioned by said Compact; and (5) what limitations on use, rights of use, and relative priorities exist as to the waters of the Colorado River System; provided, however, that by these reservations there is no intent to disturb the apportionment made by Article III(a) of the Colorado River Compact between the Upper Basin and the Lower Basin."

> the intent, effect, meaning and interpretation of the compact and act. The language of Article 10 is plain and unequivocal and adequately reserves all questions of interpretation of the compact and the act."[92]

Finally, as the Master pointed out, "Section 4(a), if read literally, would prohibit California from consuming water from the Colorado River in excess of 4,400,000 acre-feet of consumptive uses per annum until consumptive uses throughout the Colorado River Basin totaled 16,000,000 acre-feet per annum" (Rep. 172). This is because California is limited by §4(a) to not more than 4.4 million acre-feet per annum plus "not more than one-half of surplus waters unapportioned by the Colorado River Compact". Literally construed, Compact Article III(a) and (b) apportions a total of 16,000,000 acre-feet (7,500,000 to each Basin and an additional 1,000,000 to the Lower Basin).

California tries to escape from this *cul de sac* of literalism by claiming that the literal construction of §4(a), if adhered to, would require California to allow water to go to waste if it were not used by those who have a prior or superior right thereto. But this is an argument against, not for, literal construction. It actually points up the absurdity resulting from California's literal interpretation. At this juncture, California abandons her "Compact means Compact" position and advocates, as her only possible answer to the Master's holding, that §4(a) be given a "sensible" rather than a literal construction. She urges:

> "The problems which the Master poses need not exist. By a *sensible* reading, the 'excess or surplus waters unapportioned by said compact' referenced in the limitation means all consumptive use from system

---

[92] WILBUR & ELY, THE HOOVER DAM DOCUMENTS A508 (1948).

water in the lower basin over and above 7.5 million acre-feet per annum of consumptive use." (Cal. Op. Br. 93)

Arguing further for the system-wide accounting, which California claims a literal construction of §4(a) would entail, California says the Master is wrong in holding that the explicit provisions of clause (3) of the second paragraph of §4(a), which assure to Arizona "the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State", militate against such a literal construction. California's attempted refutation of the Master is frivolous. In the teeth of this plain and simple language, California insists that the Gila and its tributaries were included in Arizona's apportionment of 2.8 million acre-feet. She says the Master's holding that clause (3) assures Arizona the use of the Gila system "in addition" to Arizona's 2.8 million acre-foot apportionment is, in effect, an amendment of §4(a) by the Master. California contends that he has converted the "'and" introducing clause (3) into "in addition" (Cal. Op. Br. 94). In other words, "(1) and (2) and (3)" are not the same as "(3) in addition to (1) and (2)". To merely state the proposition is to refute it.

The senatorial debates cited by the Master show unmistakably the congressional intent that tributary uses in Arizona should not be deducted from Arizona's main stream allocation of 2.8 million acre-feet (Rep. 179 note 38). In this way, Congress sought to resolve the controversy arising from California's claim, asserted then as it is re-asserted now, that the Gila and its tributaries had been included in the water apportioned by the Compact. This explains why the Gila system in Arizona was singled out

from the other Lower Basin tributaries of the Colorado for special and explicit treatment in §4(a).[93]

Invoking the maxim, *expressio unius exclusio alterius*, California contends that at any rate Lower Basin tributaries other than the Gila are literally included in the §4(a) apportionment (Cal. Op. Br. 95). But here again literalism must give way to realism: the reality with which Congress dealt and intended to deal, as revealed so plainly in the legislative history, was water of the main stream of the Colorado River stored in Lake Mead and released or available for use below Hoover Dam.

California points to the 1939 Act of the Arizona Legislature which approved a proposed tri-state compact containing a clause to the effect that "in addition to" 2.8 million acre-feet of Article III(a) water and one-half of surplus, Arizona should have exclusive use of the Gila within her boundaries. California finds it significant that the Act provided for approval of the contemplated tri-state compact by Congress—an approval which, she argues, would not have been necessary if the exclusion of the Gila from the Arizona apportionment of 2.8 million acre-feet had been intended by the §4(a) tri-state compact which Congress had approved in advance (Cal. Op. Br. 95-96).

The answer is simple: The proposed tri-state agreement set forth in the 1939 statute contained many provisions not included in the tri-state compact approved in

---

[93] The Gila and its tributaries were also expressly exempted from use to satisfy the Mexican treaty obligation by subsection (4) of the second paragraph of §4(a) to allay Arizona's fears, which had up to then prevented her ratification of the Compact, that the Gila system would be subjected by the Compact to the Mexican treaty obligation, under the systemwide allocation attributed to the Compact by California. See pp. 62-63, *supra;* 70 Cong. Rec. 466 (1928).

advance by §4(a)[94]; hence congressional ratification of its terms was required. The subsequent 1941 legislation which passed the Arizona Senate but failed in the House did not in terms require further consent of Congress (Cal. Op. Br. 96) because its provisions conformed precisely to those approved in advance in §4(a) of the Project Act.[95]

In attacking the Master's conclusion that Congress intended §4(a) to relate solely to water in Lake Mead and in the main stream below Lake Mead within the United States, California would create the impression that only two words in §4(a)—"Colorado River"—constitute the whole foundation for the Master's conclusion (Cal. Op. Br. 100-01). Important and significant as they are, the Master does not "seize upon" "only two words" in §4(a), "out of the entire statutory language" to support his conclusion. Earlier in his Report he analyzes in detail the provisions of §§1, 5, 6 and 8 and concludes that these sections clearly express the intent of Congress to deal in the Project Act with "the allocation and delivery of water to Arizona, California and Nevada from Lake Mead and from the Colorado River below Lake Mead" (Rep. 151) (footnote omitted).

To be sure, in construing the California limitation, the Master refers to the very language of §4(a), pointing out that "it refers to the Colorado River and not to the System. . . ." But in the very next sentence he states:

> "*But more important,* the second paragraph of Section 4(a) demonstrates that Congress considered the limitation on California to be part of an overall allocation of the entire quantity of water dealt with

---

[94] *E.g.*, Article I stating purposes, Article II defining terms, Article IV making Arizona's ratification of the Colorado River Compact conditional upon approval of the proposed tri-state compact by Congress, California and Nevada. C 1322 for iden. (Tr. 11,436).

[95] C 1323 for iden. (Tr. 11,436).

> in that Section among three states only: of the first 7.5 million acre-feet—4.4 to California, 2.8 to Arizona, and .3 to Nevada; the balance to California and Arizona equally." (Rep. 174)

The Master then verifies this interpretation of the statutory language by reference to the legislative history (Rep. 174), discussed previously (Ariz. Op. Br. 61-67; pp. 62-67, *supra*).

California finds inconsistency in the Master's conclusion that the §4(a) references to the Compact are employed otherwise than in the Compact sense and urges that other references to that instrument in §§6, 8, 12, 13 and 19 are employed in the Compact sense (Cal. Op. Br. 102). There is good reason for the distinction. These last mentioned sections were intended to preserve inviolate the Compact's *interbasin* apportionment. They have nothing whatever to do with the Lower Basin *interstate* apportionment established by §4(a).

Nor is there inconsistency between the Project Act and the Compact, as California claims (Cal. Op. Br. 104-05). There can be no inconsistency between these two instruments which deal with two different subject matters and are designed to accomplish two different ends. Thus the Compact made only an *interbasin* allocation of water. The Project Act is concerned with an *interstate* allocation of water in the Lower Basin. The fact, if it be a fact,[96] that Congress in the Project Act used Compact terminology in a sense different from that of the Compact's negotiators does not render the two instruments inconsistent or contradictory.

California also questions the Master's holding that "the water to a portion of which California is limited by Section 4(a) is that part of the mainstream which consists of Lake

[96] Arizona does not agree with the Master's construction of the Compact (see Ariz. Op. Br. 72-81).

Mead and the River below" (Rep. 183). It is argued that the Master is wrong because plans to divert river water above Lake Mead for use in Arizona and California have been considered both before passage of the Project Act and from time to time afterwards down to the present day; and California questions that Congress would have restricted the operation of Project Act §§4(a) and 5 to Lake Mead and below in view of these contemplated diversions above Lake Mead (Cal. Op. Br. 124-27).

To this there are several answers. Congress has exercised its dominant servitude over all water in the main stream, whether that water is delivered at Lee Ferry or constitutes inflow which reaches the main stream between Lake Mead and Lee Ferry; hence any diversion and use of water from the main stream between Lee Ferry and Lake Mead, if made without the consent of Congress, would by necessary implication violate the Project Act (see pp. 156-58, *infra*).

Moreover, the Project Act authorized the Secretary of the Interior "to construct, operate, and maintain a dam and incidental works in the main stream of the Colorado River . . . adequate to create a storage reservoir . . . and a main canal," and it specified that the dam site was to be either "at Black Canyon or Boulder Canyon" (Project Act §1). The California limitation includes "all uses under contracts made under the provisions of this Act" (§4(a)), and the Secretary is authorized "to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon" (§5). The authority conferred on the Secretary by Congress, as the Master observed, specifically applies "only to water in Lake Mead and to water released therefrom. Also Sections 6 and 8 of the Project Act apply in terms to water controlled by the United States by means of Hoover Dam" (Rep. 183).

It is a fact that Senator Cameron of Arizona opposed Black Canyon and Boulder Canyon as alternative sites for the proposed dam and reservoir and urged the adoption of a high dam at Bridge Canyon (Cal. Op. Br. 124-25). But Congress rejected this suggestion when it enacted the Project Act. In so doing Congress fully realized that no projects for the diversion of water from the main stream above the authorized dam and reservoir could be made without congressional approval and consent. This is of course true of the proposed Marble Canyon diversion, which California pretends to view with such alarm.

Therefore, although diversions above the optional dam sites specified by the Project Act were favored by some when the bill was pending enactment, since Congress in enacting the Project Act appropriated the water supply let down from the Upper Basin to improve navigation and for related purposes, including the generation of power to finance the project, Congress assumed no risk in restricting the Project Act interstate apportionment to water in Lake Mead and in the main stream below.

As a final argument in support of the claim that the congressional reference to the Article III(a) apportionment must be construed literally in the Compact sense, California says the terms of the California limitation set forth in §4(a) of the Project Act constituted "an offer to California", which she "accepted . . . by enacting the limitation" and by ratifying the Compact, and that this "offer" and "acceptance" "established a statutory compact" (Cal. Op. Br. 128-37). California further states that this was an offer to the seven basin states to enter into an agreement, which did not become effective until accepted by those states. "Each state," California argues, "had to interpret the offer in order to decide whether to accept it" (Cal. Op. Br. 130).

The terms of the §4(a) limitation do not constitute a contractual offer but a condition precedent laid down by Congress for the effectiveness of the Project Act. "The meaning of the condition is necessarily determined by the congressional intent, just as the interpretation of other provisions of the statute is governed by such intent" (Rep. 181).

It is not the subjective construction put upon the terms of the limitation, whether by California or any of the six "beneficiary" states, which governs; it is the meaning of the words used in the historical and legislative context in which Congress employed them that is determinative. Otherwise, there would be as many individual "statutory compacts" as there are individual state interpretations of the alleged "offer" made by §4(a). Since California and Arizona differ radically as to the meaning of the "offer", there would be at least two "statutory compacts", *i.e.*, the United States-California compact and the United States-Arizona compact.

Moreover, the United States asserts that "the Project Act was made dependent on a modification of the Compact and California's adoption of a Limitation Act accepting a 4,400,000 acre-foot limitation on its use of the initial 7,500,000 acre-feet of mainstream water available annually for the Lower Basin" (U. S. Op. Br. 10). This construction of the §4(a) "offer" directly contradicts California's interpretation of the very same "offer". It is obvious that adoption of the California theory of the "consensual nature of the limitation" would lead inevitably into a morass of utter confusion.

Further, the legislative history—the hearings before the Senate and House Committees on the various Swing-Johnson bills and the debates in the House and Senate upon those

measures—conclusively establish that it was main stream and main stream water only that Congress was dealing with in the California limitation (see Ariz. Op. Br. 61-67; pp. 62-67, *supra*).

III

Contrary to California's contention, the Secretary's water delivery contracts reflect an administrative recognition that the Project Act established a formula for the interstate allocation of main stream water to which the contracts should conform.[97]

A. The Contractual Pattern

The Secretary's water delivery contracts simply cannot be read objectively without observing that they were drawn in an effort to conform with the formula or allocation scheme established by §§4(a) and 5 of the Project Act. From what source has the Secretary derived the quantities of water specified in his contracts other than these provisions of the statute? What other origin is there for the "maximum of 2,800,000 acre-feet" specified in the Arizona contract? Or the "total quantity not to exceed . . . 300,000 . . . acre-feet" in the Nevada supplemental contract? Or the 4,400,000 acre-feet constituting the first four intrastate priorities recited in each of the contracts with California agencies? Surely it cannot be mere coincidence that the total of 3.1 million acre-feet contracted for in the Arizona and Nevada contracts, together with the 4.4 million acre-feet constituting the first four priorities specified in the California contracts, equals precisely the aggregate of 7.5 million acre-feet dealt with in §4(a). Nor can it be merely

---

[97] This point is directed principally to a refutation of Part Four of California's Opening Brief, pages 195-231.

by chance that the Arizona contract provides for delivery of one-half of surplus, even though the contract purports to recognize rights of Nevada, New Mexico and Utah in that surplus.[98]

Despite all this California insists that she does not perceive in the water delivery contracts the reflection of any allocation scheme whatever.

B. California's Analysis of the Contracts

California would have the Court infer from the fact that the Secretary did not write out "the major elements of [the] . . . scheme on paper, in one place, formally promulgated" that the scheme itself does not exist (Cal. Op. Br. 196). There is nothing in the Project Act requiring the Secretary to commit the allocation scheme to writing in one instrument. Nor does the fact that his general regulations do not make an apportionment of water indicate "his lack of authority to make an interstate allocation for consumptive use" (Cal. Op. Br. 198). It was not the intent of Congress that the Secretary effectuate its allocation scheme by regulation but by contract. The Secretary's regulations recognize this and indeed implement the allocation scheme of the Project Act. They specifically provide that:

> "Contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to Paragraph a of Section 4 of the Boulder Canyon Project Act."[99]

Thus the Secretary's general regulations incorporate by reference the formula established by §4(a).

---

[98] See Ariz. Op. Br. 99-104.

[99] General Regulations Governing Contracts for the Storage of Water in Boulder Canyon Reservoir, and the Delivery Thereof §4, Ariz. Op. Br. Appendix D, p. 29a.

From the fact that §5 contains detailed specifications governing the Secretary's contracts for electrical energy, but does not similarly spell out the details of his contracts for the storage and delivery of water, California argues that, while the Secretary was empowered to make an interstate apportionment of power, he was not authorized to make an interstate allocation of water (Cal. Op. Br. 196-200). But §5, by providing that

> "Contracts respecting water for irrigation and domestic uses shall . . . conform to paragraph (a) of Section 4 of this Act"

subjected the Secretary's water delivery contracts to the formula of §4(a) and thereby established standards for his guidance in making those contracts.

No such formula for the allocation of electrical energy is to be found in the Project Act elsewhere than in §5. Hence it is that §5 provides:

> "General and uniform regulations shall be prescribed by the said Secretary for the awarding of contracts for the sale and delivery of electrical energy, and for renewals under subdivision (b) of this section, *and in making such contracts the following shall govern. . . .*" [100]

---

[100] By excising portions from the quotation of §5 California creates the misleading impression that the first paragraph of that section applies only to the Secretary's authority to promulgate regulations governing his water delivery contracts—which California says are "permissive"—and does not apply to his electrical energy regulations, which California says are mandatory. The first paragraph applies in express terms to *both* species of regulations:

> "The secretary . . . is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the river and on said canal as may be agreed upon for irrigation and domestic uses, *and generation of electrical energy and delivery at the switch board to States. . . .*"

The italicized provisions have been deleted in the California version (Cal. Op. Br. 197).

Then follow in subsections (a) through (d) the detailed provisions that power contracts are required to contain.

California seems to argue that because each one of the Secretary's several water delivery contracts, considered separately, does not purport to make a complete apportionment of water among the three Lower Basin states, no interstate allocation of water is effectuated by all the contracts taken together (Cal. Op. Br. 200). But the interstate allocation made by the statute is put into effect by the contracts *collectively*. Each contract makes the delivery of the quantity of water specified in it "subject to availability thereof for use in . . . [the contracting state or agency] under the Colorado River Compact and the Boulder Canyon Project Act", *i.e.*, subject to its availability under the §4 (a) formula (*e.g.*, Palo Verde Irrigation District Contract Article 6, Ariz. Op. Br. Appendix H, pp. 60a-61a).

Concededly, the water delivery contracts which the Secretary has made do not conform precisely with the formula prescribed by the Project Act. The Master holds that exact conformity with the apportionment proposed by Congress is not required—that substantial compliance is enough (Rep. 162-63). This gives rise to one of Arizona's differences with the Master. We contend that insofar as the contracts do not conform to the formula they are outside the Secretary's delegated authority and are void (Ariz. Op. Br. 83-105).

But it is a far different thing and fallacious to conclude, as California does, that because the Secretary's contracts do not precisely conform to the statutory allocation, the allocation scheme itself is non-existent (Cal. Op. Br. 200-06). Following this reasoning, there would be no congressional standard for the administrative supplementation of any statute which could not be defeated simply by the failure of

the administrator to comply with the standard prescribed. In short, one does not look to the contracts to see if the formula exists; one looks to the formula to see if the contracts are valid.

Thus, the Master properly determines the validity of the provisions of the Arizona and Nevada contracts by applying to them the Project Act authorization for the interstate allocation of water, as he construes it. Having found that the allocation proposed by Congress is not mandatory in the sense that it requires precise contractual conformity (Rep. 162-63), he upholds those contractual departures which he regards as unsubstantial (Rep. 202). On the other hand, when he finds that provisions of the Arizona and Nevada contracts violate the mandatory requirements of Congress, *e.g.*, that they shall be for permanent service (§5), he refuses to sustain their validity (Rep. 237-47).

California points to her own water delivery contracts as proof that no allocation scheme exists. Thus she states that the California contracts provide for the delivery "of the aggregate quantity of water sufficient to satisfy 5,362,000 acre-feet of consumptive use annually . . ."—they do not require delivery "to California [of] 4.4 million acre-feet of consumptive use and one-half of any excess or surplus waters from the 'mainstream' " (Cal. Op. Br. 203). However, the intrastate priorities fixed by the Seven-Party Agreement and incorporated into each California contract show on their face a recognition of, and an attempt to conform to, that integral part of the allocation scheme constituted by the California limitation prescribed by §4(a). The composition of the aggregate of 5,362,000 acre-feet contracted for in the California contracts and the way in which that aggregate is divided among those intrastate priorities is set forth in the Appendix to California's Opening Brief:

Priority No.[101]	Agency and Description	Annual Quantity in Acre-feet (Beneficial Consumptive Use)	
1	Palo Verde Irrigation District—104,500 acres in and adjoining existing district		
2	Yuma Project (California division)—not exceeding 25,000 acres		
3	(a) Imperial Irrigation District and lands in Imperial and Coachella Valleys to be served by All-American Canal	3,850,000	4,400,000
	(b) Palo Verde Irrigation District—16,000 acres of adjoining mesa		
4	Metropolitan Water District and/or City of Los Angeles	550,000	
5	(a) Metropolitan Water District and/or City of Los Angeles	550,000	
	(b) City and/or County of San Diego	112,000	
6	(a) Imperial Irrigation District and lands in Imperial and Coachella Valleys to be served by All-American Canal	300,000	
	(b) Palo Verde Irrigation District — 16,000 acres of adjoining mesa		
		5,362,000	
7	Agricultural use in the Colorado River Basin in California, as designated in Map 23000, U. S. Bureau of Reclamation	All remaining water available for use in California	

The total of the first four priorities is exactly 4,400,000 acre-feet. The total of priorities numbered 4 and 5(a) is 1,100,000 acre-feet. Since these two priorities are in favor of the same agency, Metropolitan Water District "and/or" City of Los Angeles, the question naturally arises: Why was the total of 1,100,000 acre-feet split into two distinct priorities of 550,000 acre-feet each? And why was the first

[101] Cal. Op. Br. A3 (footnotes omitted).

[102] Our addition.

priority given precedence over the second? The reason is self-evident: The first four priorities totaling 4.4 million acre-feet (including the first priority of 550,000 acre-feet to Metropolitan Water District "and/or" City of Los Angeles) are to be satisfied out of the 4.4 million acre-feet dealt with in §4(a) of the Project Act, and the balance of the total of 5,362,000 acre-feet, or 962,000 acre-feet, is to be satisfied out of the surplus dealt with in §4(a) as part of the California limitation.

As the Master said:

> "These contracts mean that the Secretary is required to apportion to California users, in accordance with the system of priorities stated in all of the California contracts, 4.4 million acre-feet of the first 7.5 million acre-feet of consumptive use of water from the mainstream in one year, plus one-half of any additional uses apportioned in that year, until a maximum of 5,362,000 acre-feet per annum is consumed in California." (Rep. 222)

And he added:

> "The 5,362,000 acre-feet for which California users have contracted must be satisfied as follows: 4,400,000 acre-feet out of the first 7,500,000 acre-feet; and 962,000 acre-feet out of surplus." (Rep. 224 note 85)

Thus, the California contracts fit into the general allocation scheme even more completely than do the contracts with Arizona and Nevada.[103]

---

[103] California also seeks to avoid this contractual conformity with the allocation scheme by contending that the annual quantity of 5,362,000 acre-feet "includes water sufficient to supply Indians, who neither have nor need contracts . . . and non-Indians, on the Reservation Division of the Yuma Project in California, who hold only individual water right applications . . .; it does not include water for the other federal reservations in California" (Cal.

California next asserts that the circumstances surrounding the execution of the water delivery contracts belie the existence of an allocation scheme. It is said, first, that prior to the Metropolitan Water District contract (the first water delivery contract executed pursuant to the Project Act) Secretary of the Interior Wilbur "disclaimed any intention to deal with the allocation of lower basin waters" (Cal. Op. Br. 204) (footnote omitted).[104] California seeks to create the impression that this "disclaimer" was connected with the Metropolitan contract,[105] although the fact is to the contrary. The "disclaimer" is a telegram dated September 27, 1929 from Secretary Wilbur in response to a message from one Van Norden that he was then conferring in Los Angeles in an endeavor to get agreement between Arizona and California on a tri-state compact for the apportionment of Lower Basin water. It was in this connection that Secretary Wilbur responded:

> "We have endeavored to keep out of all controversy regarding allocation lower water basin (*sic*). Do not consider this our field. . . ."

In other words, the Secretary discreetly refused to intervene in any discussions looking toward a division of water by tri-state compact.

Op. Br. 203). The only federal use of Colorado River water within California at the time of the Seven-Party Agreement and the California water delivery contracts was that of the Yuma Indian Reservation, which is recognized and covered by the second priority of the Seven-Party Agreement, which priority also covers non-Indian uses on the Reservation Division of the Yuma Project (see p. 23, *supra*).

[104] California relies on her Exhibit 7553 for iden. (Tr. 2760). This is one of the documents included in California's Offer of Proof, which the Master rejected (Rep. 248-53).

[105] A 38 (Tr. 251).

Subsequent Secretaries of the Interior maintained a similar position of neutrality. They did not, as California asserts, disclaim "any intention to deal with the allocation of lower basin waters" (Cal. Op. Br. 204). In concluding water delivery contracts with California public agencies and with Nevada and Arizona, the Secretaries undertook to effectuate the allocation scheme of the Project Act. In every instance the allocation of water among the contractees was made subject to the legal "availability thereof for use . . . under the Colorado River Compact and the Boulder Canyon Project Act" (*e.g.*, Palo Verde Irrigation District Contract Article 6, Ariz. Op. Br. Appendix H, pp. 60a-61a). In this way successive Secretaries made their water delivery contracts without favoring any party in the continuing controversy as to the proper construction of the Compact and the Project Act.[106]

California also refers (Cal. Op. Br. 205) to the fact that the regulations promulgated by Secretary Wilbur in 1933 authorizing a water delivery contract with Arizona said nothing about excess or surplus and that these regulations were later revoked by Secretary Ickes. However, as we have previously noted (p. 86, *supra*), the Project Act did not intend the interstate allocation to be effectuated by the Secretary's regulations but by his *contracts*. While §4(a) made an interstate allocation of water, there was no right to the delivery of water without a contract pursuant to §5.

California next calls attention to the first Nevada contract of 1942, calling for the delivery of up to 100,000 acre-feet of water per annum and asks: "Did this forever

[106] This is how the Special Master read the documents cited by California (Cal. Op. Br. 204 notes 1, 2), which were included in her rejected Offer of Proof.

fix the proportion in which Nevada could share 'mainstream' water?" (Cal. Op. Br. 205) We respond: Although the Secretary's contracts may not exceed the maximum allocation specified by §4(a) in the case of a particular state, nothing requires the Secretary to operate on an "all at once or nothing" basis or prevents him from entering into a contract for a portion of the maximum allocation, as he did in the case of the first Nevada contract. In fact, the first Nevada contract expressly provided in Article 5(a) that "the right of the State to contract for the delivery to it from storage in Lake Mead of additional water is not limited by this contract" (Ariz. Op. Br. Appendix F, p. 46a).

Along the same line, California argues that, while annual delivery of an aggregate of 5,362,000 acre-feet is called for by the contracts with California agencies, the contracts do not themselves add up to that figure, which includes the right of the Yuma Project for which "no contract has ever been written". But California concedes that the Yuma Project is recognized in the contracts as "entitled to a second California priority" (Cal. Op. Br. 205). This priority is for water "for beneficial use not exceeding a gross area of 25,000 acres of land located in said project in California", and it is to be satisfied out of the aggregate of "3,850,000 acre-feet of water per annum" allotted to the first three priorities of the Seven-Party Agreement (*e. g.*, Palo Verde Irrigation District Contract Article 6, Ariz. Op. Br. Appendix H, p. 61a).

As we have said earlier, all the water delivery contracts are uniformly subject to the legal availability, under the Compact and the Project Act, of the water contracted for. This means that should it develop that the Secretary has contracted for either more or less water

than authorized, his contracts by their very terms are to that extent violative of the Project Act.[107] Whether or not this has in fact occurred depends on how this Court construes the Project Act.

California takes issue with the Master's conclusion that "the contractual allocation scheme also determines each state's apportionment in the event of insufficient mainstream water to supply 7.5 million acre-feet of consumptive use in one year. In such event, the allocation scheme requires each state to share the burden of the shortage ratably" (Rep. 233). California denies that if there is a contractual allocation scheme, it controls this issue, or, if it does control, "that it adopts any principles other than those of priority and equitable apportionment" (Cal. Op. Br. 211).

While it is true that in providing for the allocation of water in §4(a) Congress did not expressly take shortages

---

[107] For example, the Assistant Chief Counsel for the Bureau of Reclamation, in a memorandum dated January 29, 1944 addressed to the Solicitor of the Department of the Interior, analysed Secretary Wilbur's contracts with California agencies and concluded:

> "It will be noted that the first four priorities total 4,400,000 acre feet, the exact amount California agreed by act of its legislature to accept from the water apportioned to the lower basin by Article III(a) of the compact. The total of the fifth and sixth priorities is 962,000 acre feet which obviously must come out of the 'one-half of any excess or surplus unapportioned by said compact'.
>
> "I have no satisfactory explanation for the reasons which prompted Secretary Wilbur to execute contracts for 962,000 acre feet of water in excess of 4,400,000 acre feet, the amount California is limited to by its act of 1929. It is abundantly clear, however, by the terms of the contracts, and the priority tables which are a part of those contracts, that the Secretary is required to deliver only 4,400,000 acre feet to California, and that he can deliver the excess 962,000 acre feet only from excess or surplus waters unapportioned by the compact after Arizona and Nevada have had delivered to them the apportioned water to which they are entitled under the compact." C 7603 for iden., part of the California Offer of Proof.

into account, it is nevertheless implicit in the basic purpose to make an equitable division of water among the three Lower Basin states that Congress intended shortages to be borne by those states ratably.[108]

Congress specified what it considered to be an equitable division of the first 7,500,000 acre-feet per annum available for use in the Lower Basin: Not more than 4,400,000 acre-feet to California, 2,800,000 acre-feet to Arizona and 300,000 acre-feet to Nevada. Congress made no express provision for the division of water among the three states should less than 7,500,000 acre-feet be available in any one year. But in the absence of any provision to the contrary, Congress must be presumed to have intended that a lesser quantity than 7,500,000 acre-feet should be divided among the states in the same proportions as those which it specified for the division of the 7,500,000 acre-feet. Hence, in prorating shortages, the Master is merely carrying out the equitable division of water which Congress must be presumed to have intended.

C. Prior Appropriation Not the Basis of Water Delivery Contracts

In concluding this point, it should be emphasized that not one of the water delivery contracts contains internal evidence that it was drawn in recognition of or in an attempt to satisfy any appropriative right. The deliveries of water contracted for are not related in any respect to

---

[108] If a literal construction of §4(a) of the Project Act is mandatory, as California on occasion contends, such a construction would logically require the conclusion that California bears all shortages. Section 4(a) limits California to the use of "not to exceed" 4,400,000 acre-feet annually and "not to exceed" one-half of the surplus. Arizona and Nevada are each given, respectively, a firm 2,800,000 and 300,000 acre-feet of water annually "for exclusive use in perpetuity" and Arizona is given the firm right to use "annually one half of the excess or surplus waters . . . ."

appropriative rights. The quantities to be delivered are clearly derived from the allocation scheme set forth in §4(a) of the Project Act. The Secretary of the Interior on the one hand, and the contracting states and agencies, on the other, freely and repeatedly entered into contracts which by their very terms bear the impress of the statutory pattern for the interstate allocation of water.[109]

There is no evidence in the record nor is there a single fact which the Court may judicially notice which gives the slightest indication that releases from Lake Mead have ever been made with a view to the satisfaction of prior appropriative rights. The record is clear that no water user, whether in California or in any other state, has sought the release of stored water to satisfy his alleged appropriative rights. No state and no public agency of a state has asserted such a right. For his part, the Secretary has never considered it either necessary or proper to ascertain any claims of right asserted on the basis of prior appropriation in determining the quantity of water which he will deliver to or within the states of the Lower Basin.[110]

A more conclusive administrative and practical construction of a statute could hardly be found.

---

[109] As California says: "No one has suggested that the California agencies, during the period 1930-1934 when the contracts were executed, entered into those contracts involuntarily" (Cal. Op. Br. 196 note 4).

[110] See Ariz. Op. Br. 46.

IV

Contrary to California's contentions, it is neither relevant nor necessary to determine water supply.[111]

A. California's Attempt to Disguise the Issue

California, after nine years of litigation, confronted with the Master's Report and Recommended Decree which reject all her major claims, now questions the jurisdiction of the Court to hear and determine the controversy.[112] California would accomplish the grotesque result of a dismissal for want of jurisdiction by injecting a false issue into the case and then insisting that the Court's jurisdiction depends upon the determination of that issue (Cal. Op. Br. 235).

The California position seems to be that no controversy over water rights is justiciable unless there is not enough water physically present in the stream to satisfy the claims asserted against it and that here the water supply available to the Lower Basin is presently sufficient to satisfy all such claims. California further asserts that the only way in which it can be demonstrated that the future water supply available to the Lower Basin will be less than the claims asserted against it is by ascertaining the rate and extent by which the increased uses in the Upper Basin will

---

[111] This point is directed to a refutation of Part Five of California's Opening Brief, pages 232-78.

[112] California raised no question as to jurisdiction until August 31, 1960, after the conclusion of oral argument on the comments of the parties to the Master's Draft Report. She then made a motion to reopen the trial for the taking of additional evidence relating to future water supply and at the conclusion of her statement in support of the motion suggested for the first time that if there is sufficient dependable supply to satisfy the demands of all the Lower Basin states it is "impossible . . . to find a justiciable case or controversy" (Cal. Op. Br. A61).

deplete the supply available to the Lower Basin. Accordingly, it is contended that in the absence of a determination of the rate and extent of Upper Basin uses there is nothing to show the existence of a justiciable controversy (Cal. Op. Br. 240).

California refers to the Master's conclusion that there is nothing to show that the Upper Basin depletion will exceed 4.8 million acre-feet per annum and that "existing California uses are in no danger of curtailment unless and until many vast new projects, some of which are not even contemplated at this time, are approved by Congress and constructed" (Rep. 115). She argues that, if these conclusions of the Master are correct, they negative the existence of a justiciable controversy, because they amount to a determination that the quantity of water available to the Lower Basin will always exceed the demands made against it (Cal. Op. Br. 240).

It is further contended by California that the Master's holding that the Compact merely places a ceiling on appropriative rights and is otherwise irrelevant to the issues in this litigation renders this case non-justiciable (Cal. Op. Br. 240), since this precludes a determination of the rights of the Upper Basin to deplete the flow of the stream and that in the absence of such a determination it cannot be shown that Lower Basin claims will exceed the Lower Basin water supply.[113]

---

[113] If, as California claims, the "classic test of a justiciable controversy over water rights" is that there is not enough water to satisfy the claims asserted against it and that test is applicable to the present litigation, then a finding that at some future date, perhaps one hundred years hence, the water supply will not be adequate to satisfy all Lower Basin claims would not meet the test and an adjudication of the claims asserted by the parties to this case must be postponed until such time as the available supply proves insufficient to satisfy them.

B. The Real and Justiciable Issue: The Legal Availability of Water

Even assuming that the "classic test of a justiciable controversy over water rights" is that there is not enough water to satisfy all claims made against the available water supply, the justiciability of the case at bar is not to be determined by application of this test. The "classic test" has been laid down and applied in litigation between states over water rights in interstate streams, when the claims of the contending states were required to be determined by the application of principles of equitable apportionment. But, as the Special Master notes, "this case involves a statutory, not an equitable, apportionment and that statutory apportionment applies irrespective of supply" (Rep. 100). We are not here concerned with standards of justiciability governing equitable apportionment cases. As the Master clearly demonstates, the claims of Arizona, California and Nevada in this litigation are governed by the Project Act, the Limitation Act and the water delivery contracts, and the doctrine of equitable apportionment is irrelevant to the determination of these claims (Rep. 100, 138).

The basic issues are stated by the United States in its petition for intervention, which presents a case in the nature of interpleader, over which this Court has exercised jurisdiction in the past. *Texas* v. *Florida,* 306 U. S. 398 (1939). The United States alleges in Paragraph XX of its petition:

> "The contracts which the Secretary of the Interior entered into as set forth in the preceding paragraphs XV through XIX provide for the delivery annually of 8,462,000 acre-feet of water stored at Hoover Dam. Contained in each of the contracts is a provision that the delivery of water by the United States will be from available storage, all to be in accordance with the Colorado River Compact and the Boulder Canyon Project Act. Because of the incorporation in these
